Energy Research Abstracts

Abstracts 2013–4550

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Department of Energy's Scientific and Technical Information Program (STIP) is carried out at many levels within the Department and by its contractor organizations. The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction and leadership for STIP and serves as DOE's national center for scientific and technical information management and dissemination. Both DOE-originated information and worldwide literature regarding advances in subjects of interest to DOE researchers are collected, processed, and disseminated through the Energy Data Information System (EDIS) maintained by OSTI. The major data bases in this system are available within the United States through commercial on-line systems and to those outside the United States through formal governmental exchange agreements. The current-year records for the major data bases plus a number of specialized data bases are available to DOE offices and contractors through OSTI's Integrated Technical Information System (ITIS). To manage DOE's information resources effectively, DOE's Scientific and Technical Information Program is one of continual development and evaluation of new information products, systems, and technologies.

Energy Research Abstracts

Purpose

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports, journal articles, conference papers and proceedings, books, patents, theses, and monographs originated by the U.S. Department of Energy, its laboratories, energy centers and contractors. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations. Foreign information is obtained through the International Energy Agency's 14-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. **Please note that *ERA* coverage of nonreport literature is limited to that generated by Department of Energy activity.**

Scope

ERA is comprehensive in its subject scope, encompassing DOE's research, development, demonstration, and technological programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for on-line searching as records within the Energy Data Base. The current-year records are available on the Integrated Technical Information System (ITIS). The entire data base is available through commercial on-line vendors.

Availability

DOE and DOE contractors who have OSTI deposit accounts can obtain *ERA* (regular issues and annual indexes) from the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401, FTS 626-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The subscription rate for 24 semimonthly issues is $184.00 for domestic subscribers and $230.00 for foreign subscribers. A single issue costs $27.00, domestic, or $33.75, foreign. Cumulative indexes are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Audrey B. Smith
Technical Editor, M. Catherine Grissom

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Canada
- Denmark
- Finland
- France
- Federal Republic of Germany
- Italy
- Japan
- The Netherlands
- Norway
- Spain
- Sweden
- Switzerland
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 75 countries and 14 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a data base for on-line retrieval. The data base serves as well for the production of numerous OSTI publications.

How To Read A Citation

The coverage of literature in this publication includes several document types, ranging from technical reports to journal articles to books. The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Patent assignee and number** for citations of patent documents or applications.
9. **Journal title, volume, and issue** for citations of journal articles.
10. **Date of publication.** If not known, a processing date is in brackets.
11. **Number of pages** or page range.
12. **Language** of document if non-English.
13. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
14. **Publisher's name and location** for documents published by a corporate or commercial source.
15. **Sponsoring organization.**
16. **Contract or grant number.**
17. **Secondary identifying number;** may be a conference number.
18. **Conference title, location, and date,** if applicable.
19. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
20. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
21. **Drop note** or explanatory statement.
22. **Abstract.**
23. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 20 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) The public should order from NTIS or from one of the other agencies listed in the citation. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

TO OBTAIN NON-REPORT LITERATURE

Non-report literature generally is available from the commercial publisher or corporation listed in the citation. These documents may also be available for loan from local libraries. First, check with the local library. Other sources of information are:

Journal articles *Chemical Abstracts Service Source Index (CASSI)* tells which libraries, both U.S. and foreign, contain a journal and the available years. *Ulrich's International Periodicals Directory* contains information on the journal and its publisher. For librarians, another source of information is On-Line Computer Library Center (OCLC), for interlibrary loans.

Books, conferences, and monographs The source for these publications is the publisher or the originating society, organization, or institution. DOE-supported conferences and individual papers reporting DOE-supported research may be available as reports from OSTI.

Foreign material The Linda Hall Library is an excellent source of foreign materials. For translations of foreign language material, contact the Library of Congress National Translation Center. For material difficult to locate, check with the British Library Document Supply Centre.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**
15:17641 DOE/ER/60664–1

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–T1 15:18494 NTIS, PC A03/MF A01 - OSTI E 1.99: DE89007246 MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the data base records.* The following list includes all of the 40 first-level and the 289 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL AND COAL PRODUCTS

Energy Research Abstracts

01 COAL AND COAL PRODUCTS

Refer also to citation(s) 2612

0103 Preparation

Refer also to citation(s) 2048, 2056, 2058, 2079

2013 (CONF-8911107–1) **The development of clean coal technology in the United States.** Streets, D.G. Argonne National Lab., IL (USA). 1989. 11p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. From Workshop on clean technology; Bangkok (Thailand); 6-8 Nov 1989. Order Number DE90001926. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The United States has made a $5-billion commitment, to be shared by the government and the private sector, to the development of a new generation of clean-coal technologies. Because the nation has a resource imperative to develop domestic coal supplies and a strong commitment to environmental protection, it seems that clean coal technologies are the preferred solution for power generation needs in the United States in the medium-term. The lessons learned during this demonstration program could have important implications for technology development and deployment in other countries. The purpose of this paper is to discuss some of the aspects of the US Clean Coal Technology (CCT) demonstration program that could be relevant to other countries. 2 refs., 8 tabs.

2014 (DOE/PC/88561–T1) **Column flotation of coal with fluorosurfactants: Final report.** Bureau of Mines, Salt Lake City, UT (USA). Salt Lake City Research Center. Oct 1989. 58p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AI22-88PC88561. Order Number DE90002300. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Laboratory tests were carried out by the US Bureau of Mines, Salt Lake City Research Center to evaluate the potential of column flotation technology, coupled with novel fluorosurfactant collectors, for the selective flotation of fine coal from pyritic sulfur and mineral matter. The results on flotation feeds of both −100 and −400 mesh Middle Kittaning seam coal samples are presented. 4 refs., 23 figs., 9 tabs.

2015 (DOE/PC/88877–T3) **Coal surface control for advanced physical fine coal cleaning technologies: Quarterly report, May 1–July 31, 1989.** Morsi, B.I.; Chiang, S.H.; Sharkey, A.; Blachere, J.; Klinzing, G.; Streeter, R.; Gray, R.; Venkatadri, R.; Chen, Y.S.; Chiarelli, P.; Perez, L.; Kim, S.; Ciocco, M.; Bi, H. Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering. 1989. 165p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88877. Order Number DE90001945. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

The overall objective of the project is to develop techniques for coal surface control prior to the advanced physical fine coal cleaning process of selective agglomeration to achieve 90% pyritic sulfur rejection while operating at a Btu recovery greater than 90% based on run-of-mine coal. The project consists of the following tasks: Project Planning; Method for Analysis of Samples; Development of Standard Beneficiation Test; Grinding Studies; Modification of Particle Surface; and Exploratory R&D and Support. This quarter, efforts were focused on the assessment of grinding studies. The three base coals, Upper Freeport, Indian county, PA; Pittsburgh No. 8, Belmont county, OH; and Illinois No. 6, Randolph county, IL, were ground under three grinding environments, air, argon, and oxygen saturated water. A large number of experimental runs were conducted to determine the effects of particle size, grinding method as well as operating conditions on Btu recovery and ash/total sulfur rejections of the three base coal. The samples obtained were analyzed using the techniques established and tested. In addition, the effects of chemical reagents on surface properties of coal particles were studied. 13 refs., 68 figs., 47 tabs.

2016 (DOE/PC/88881–T4) **[Advanced physical fine coal cleaning: Froth flotation]: Quarterly technical progress report, July 1, 1989–September 30, 1989.** Kaiser Engineers, Inc., Pittsburgh, PA (USA). [1989]. 51p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88881. Order Number DE90003374. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

An engineering development project was prepared to build upon the basic research effort conducted under a solicitation for research into Fine Coal Surface Control. The engineering development project is intended to use general plant design knowledge and conceptualize a plant to utilize advanced froth flotation technology to process coal and produce a product having maximum practical pyritic sulfur reduction consistent with maximum practical BTU recovery. 26 figs., 15 tabs.

2017 (DOE/PC/88886–T4) **Development of an advanced process for drying fine coal in an inclined fluidized bed: Technical progress report for the fourth quarterly, July 1, 1989–September 30, 1989.** Boysen, J.E.; Kang, T.W.; Cha, C.Y.; Berggren, M.H.; Jha, M.C. Western Research Inst., Laramie, WY (USA). Oct 1989. 69p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88886. Order Number DE90003036. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The main objective of this research is to develop a thermal process for drying fine coal that (1) reduces explosion potential, (2) uses a fluidized bed with minimum elutriation, (3) produces a stable dry coal by preventing moisture reabsorption and autogeneous heating, (4) reduces fugitive dust emissions, and (5) is technically and economically feasible. The project scope of work requires completion of five tasks: (1) project planning, (2) characterization of the two feed coals, (3) bench-scale IFB drying studies, (4) product characterization and testing, and (5) technical and economic process evaluation. The project technical achievements are primarily related to understanding of the behavior of the two coals in the IFB reactor. Solids residence time and solids entrainment can be correlated using the Reynolds number. Gas produced from the coal during drying and the product composition can be correlated to the average dryer temperature. A dry product with minimal proximate moisture and substantially increased heating value can be produced from either of these coals under a wide variety of fluidizing gas-to-solids ratios and IFB operating temperatures. Product characterization indicates that moisture reabsorption can be significantly reduced and that fugitive dust contents can be almost completely reduced. 4 refs., 19 figs., 24 tabs.

2018 (CONF-891079–1) **Chlorine related degradation of materials in coal liquefaction.** Keiser, J.R.; Judkins, R.R. Oak Ridge National Lab., TN (USA). 1989. 22p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC05-84OR21400. (CONF-8910280–1: 1. international conference on chlorine in coal; Joint meeting of the U.S. DOE (PETC)/Japan AIST-NEDO Committee on Coal Liquefaction, Chicago, IL (USA); Tokyo (Japan), 9-11 Oct 1989; 27 oct - 10 nov 1). Order Number DE90002707. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During the 1970's, a concentrated effort was directed toward development of coal liquefaction in the United States, at least in part, because of the demonstrated vulnerability of this country during the oil embargoes. A number of pilot plants were operated to evaluate different liquefaction processes, and the performance of structural materials was assessed in these plants. Although material performance in coal liquefaction plants had many similarities with performance in petrochemical plants, the presence of significant amounts of chlorine in some coals caused serious problems. Severe

localized corrosion that was related to amine hydrochlorides was encountered in fractionation columns, and chloride stress corrosion cracking was found in many pipes and vessels. 12 refs., 5 figs.

2019 (DOE/PC/79926–6) **Kinetics of coal conversion to soluble products: January 1, 1989–June 30, 1989.** Yamada, O.; Larsen, J.W. Lehigh Univ., Bethlehem, PA (USA). Dept. of Chemistry. 2 Aug 1989. 6p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79926. Order Number DE90002764. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objectives of this work are: (1) to measure the kinetics of the conversion of coals to soluble products under model liquefaction conditions using gel permeation chromatography (GPC) techniques to count the number of bonds broken; and (2) to analyze these data using kinetic schemes based on the behavior of crosslinked macromolecular networks. 5 refs., 1 tab.

2020 (DOE/PC/79926–7) **Kinetics of coal conversion to soluble products: Quarterly report, July 1, 1989–September 30, 1989.** Yamada, O.; Larsen, J.W. Lehigh Univ., Bethlehem, PA (USA). Dept. of Chemistry. 13 Oct 1989. 10p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79926. Order Number DE90002765. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objectives of this work are: (1) to measure the kinetics of the conversion of coals to soluble products under model liquefaction conditions using gel permeation chromatography (GPC) techniques to count the number of bonds broken; and (2) to analyze these data using kinetic schemes based on the behavior of crosslinked macromolecular networks. 10 refs., 3 figs.

2021 (DOE/PC/79933–8) **Effectiveness factors for hydroprocessing of coal and coal liquids: Progress report No. 8, June 15, 1989–September 15, 1989.** Massoth, F.E.; Seader, J.D. Utah Univ., Salt Lake City, UT (USA). 20 Sep 1989. 28p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79933. Order Number DE90001694. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The research entails a study of hydrodenitrogenation of model compounds and coal-derived liquids using three NiMo/alumina catalysts of different pore size to develop, for restrictive diffusion, a relationship that can be used for estimating reliable effectiveness factors. Measurement of pertinent properties of the catalysts and of several coal liquids. Determination of effective diffusivities and tortuosities of the catalysts. Development of restrictive diffusion correlations from data on model N-compound reactions. Testing of correlations with coal-liquid cuts and whole coal-liquid feed. 5 refs., 8 figs., 10 tabs.

2022 (DOE/PC/88812–T5) **Process and analytical studies of enhanced low severity co-processing using selective coal pretreatment: Quarterly technical progress report, June–August, 1989.** Baldwin, R.M.; Miller, R.L. Colorado School of Mines, Golden, CO (USA). Dept. of Chemical Engineering and Petroleum Refining. 1989. 18p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88812. Order Number DE90003373. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes progress on research during the fourth quarter of this contract dealing with applications of coal pretreatment techniques in coal hydroliquefaction by co-processing. The objectives of the project are to investigate various coal pretreatment techniques and to determine the effect of these pretreatment procedures on the reactivity of the coal. Reactivity enhancement will be evaluated under both direct hydroliquefaction and co-processing conditions. Research this quarter focused on the experimental evaluation of a matrix of runs for coals that had been alkylated following the procedure described by Sternberg et al. Both a Wyodak subbituminous and an Illinois No. 6 bituminous coal from the Argonne Premium Sample Bank were alkylated via the Sternberg recipe. Four different sets of reaction conditions were employed. A series of runs to investigate the effect of drying and water on reactivity was carried out. 4 refs., 3 figs., 1 tab.

2023 (DOE/PC/88813–T4) **A solid-state NMR study of condensation/retrograde reactions during coal liquefaction: Quarterly progress report, July 1–September 30, 1989.** Miknis, F.P. Western Research Inst., Laramie, WY (USA). Nov 1989. 9p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88813. Order Number DE90003372. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objective of this work is to perform an NMR study of the aromaticity in coal, coal derived products and/or model compounds generated by pyrolysis and thermal solubilization of coal in the presence of a hydrogen donor solvent. Cross Polarization with Magic-Angle Spinning (CP/MAS) will be used to measure the carbon aromaticity, and Combined Rotation and Multiple Pulse Spectroscopy (CRAMPS) NMR techniques will be used to measure the hydrogen aromaticity. From these NMR measurements the aromatic hydrogen-to-carbon ratio will be obtained and used to study condensation/retrograde reactions during coal liquefaction. 2 refs., 1 fig.

2024 (DOE/PC/88917–T2) **A new approach in ultrapurification of coal by selective flocculation: Annual report.** Moudgil, B.M. Florida Univ., Gainesville, FL (USA). Sep 1989. 100p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88917. Order Number DE90003371. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The objective of the present study is to utilize, and if necessary further develop, mathematical model to predict the conditions for optimum selectivity in coal-coal pyrite/coal refuse system with a given flocculant. Coal and coal refuse from Pittsburgh-Bruceton mine and coal pyrite from a southwestern Pennsylvania coal preparation plant were used in this study. Several polymers, including polyacrylamides, polyethylene oxide and hydrophobic polymers were examined for their selectivity towards flocculating coal, coal refuse or coal pyrite. The computational model for the coal-coal pyrite/coal refuse system was developed and rewriting the computer program in FORTRAN (it was originally written in PASCAL) was completed. This with the aid of advance programming techniques, enabled computation with more particles than was possible before. 31 refs., 30 figs., 11 tabs.

2025 (DOE/PC/88935–T3) **Inhibition of retrogressive reactions in coal/petroleum co-processing: Quarterly technical progress report, June 1, 1989–August 31, 1989.** Schobert, H.H.; Tomic, J. Pennsylvania State Univ., University Park, PA (USA). Coll. of Earth and Mineral Sciences. Jul 1989. 16p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88935. Order Number DE90002761. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The overall objective of this project is to develop a fundamental understanding of the reactions occurring at the onset of coke formation during the co-processing of coals with petroleum residue. The specific objectives include examination of chemical components, or groups of components, in coals and petroleum feedstocks to quantify and rank the effects of these components on retardation or enhancement of coke formation. The work involves bench scale reactions in microautoclaves, supplemented by optical microscopy of carbonaceous residues and such instrumental analyses as ^{13}C NMR and GC/MS. During this reporting period the work focused largely on the identification of solvation and dispersion effects. Microautoclave testing has been started with mixtures of model compounds and the selected coals, to begin to identify those features of model compound structure which are important in solvating the coals. 4 refs., 3 figs., 2 tabs.

2026 (DOE/PC/90910–T1) **Enhanced coal liquefaction by low-severity catalytic reactions: Final report.** Davis, A.; Derbyshire, F.J.; Mitchell, G.D.; Schobert, H.H. Pennsylvania State Univ., University Park, PA (USA). Energy and Fuels Research Center. Jul 1989. 175p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC90910. Order Number DE90001460. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

This program of research has involved the investigation of the liquefaction of coals by reaction in successive stages of increasing temperature in order to understand the chemical processes occurring in the individual stages. Process variables included the influence of coal rank (lignite, subbituminous, hvCb and hvAb) and the role of catalysts (1.0 wt% Mo or Fe or 1.0% Fe + 0.1% Mo) and vehicle solvents. The exact nature of the relatively subtle reactions occurring in the low- and high-temperature stages have not been clearly identified in this research. Our results suggest that the first

stage reactions involve mild hydrogenation. An increase in the pool of hydrogen available within the coal structure could precondition the coal and favorably bias the course of the higher temperature reaction toward hydroliquefaction rather than pyrolysis. We have determined that the temperature-stages reaction sequence can accommodate fairly large changes in reaction conditions before an appreciable effect on product yield becomes apparent. 57 refs., 43 figs., 40 tabs.

2027 (EMR-SFA–83) **Synthetic fuels from coal-heavy oil mixtures. Phase 1. A survey of the work applicable to coal bitumen mixtures as synthetic fuels feedstock.** Department of Energy, Mines and Resources, Ottawa, ON (Canada). Jan 1983. 8p. Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth Street, Ottawa, Ontario, Canada K1A OG1.

This paper presents a review of significant research and development being performed worldwide that is applicable to the conversion of coal and bitumen to synthetic liquid fuels. Coal liquefaction processes are outlined as historical background. The process that is being sought by this review is one that combines the processing of coal and bitumen to produce a synthetic crude oil, notably one in which bitumen serves as the slurry medium for coal. Research in Canada, the USA, Europe, and Japan is summarized. Major current efforts are the Alberta Research Council program using bitumen and heavy oil, and the Auburn University/Cities Service program using oil refinery streams as feedstocks with coal. 17 refs., 2 tabs.

2028 (ETDE-mf–0717924) **Key chemicals from synthesis gas - development of novel zeolites as catalysts for conversion of methanol into hydrocarbons.** Fleckenstein, T.; Marquart, R.; Kahl, J.; Belendorff, K.; Groeb, J.; Herrmann, C.; Danner, A. Technische Hochschule Darmstadt (Germany, F.R.). Inst. fuer Chemische Technologie. [1989]. 110p. (In German). 03 C113. Order Number DE90717924. Available from NTIS (US Sales Only), PC A05/MF A01.

The present study comprises the production and characterization of zeolites as well as their use as catalysts for the conversion of methanol into olefins. The reaction was carried out in small fixed-bed reactors. By using IR spectroscopy for the characterization of the acid OH groups as active centres of the zeolites, the reaction could be observed on the catalyst surface. (EF).

2029 (ETDE-mf–0721837) **Production of coke with specific metallurgical properties. Analysis of conditions in the blast furnace.** Velikonja, L. Technische Hochschule Aachen (Germany, F.R.). Fakultaet fuer Bergbau und Huettenwesen. 21 Aug 1987. 105p. (In German). Order Number DE90721837. Available from NTIS (US Sales Only), PC A06/MF A01.

In the present study tests are carried out on cokes with the aim to reduce the alkalis and sulphur contents during the coking process by addition of suitable auxiliary substances. The following points are of interest: 1. discussion of the behaviour of sulphur and alkalis in blast furnaces, 2. summary of available knowledge on the behaviour of coke in blast furnaces, 3. discussion of the possibilities to influence sulphur and alkalis during the coking process by using thermodynamic calculations, 4. alkali volatilization tests on model substances under conditions similar to coking processes, 5. investigation of the influence of different additives on sulphur and alkalis on the basis of coking tests and 6. discussion of the whole field of problems. (orig./RB).

2030 (NEI-FI–14) **Gasification of solid fuels in energy management of industry.** Kauppa- ja Teollisuusministerio, Helsinki (Finland). Energiaosasto. 1984. 196p. (In Finnish). Order Number DE90719345. Available from NTIS (US Sales Only), PC A09/MF A01.

In this project, which was finacially supported by the Ministry of Trade and Industry the technical and economical problems and possibilities associated with the gasification of peat and park have been studied. Main attention has been paid on experimental research of different gascleaning methods and on the feasibility studies of three gasturbine power plant consepts, which were based on the present state of technology. The feasibility of a 2 MWe gas turbine power plant, which was based on pressurized gasification and combustion, was also considered. The following gas cleaning methods were studied: the utilization of an inlet volume of a gas turbine as a particle separator (so called super cyclone), the efficiency of a wet cyclone as a gas cleaner, the conventional wet cleaning and a dry cleaning method. Both the super cyclone trials and the dry cleaning trials gave very promising results. With the stated initial conditions and calculation methods the gas turbine alternative with atmospheric gasification, with wet gas cleaning system and with wet oxidation of waste waters became most expensive in every case. However, the differences in comparison with the back pressure powerplants were within 5-10%. The feasibility of a gas turbine power plant can be improved especially by developing the dry cleaning methods of the LCV-gas. The limiting investment cost for a 2 MWe gasturbine power plant was estimated to be 21 Mmk. It seems possible to remain below this limit, if pressurized gasification and combustion is used. On the gas cleaning of this alternative there are, however some technical problems which should be still studied and solved.

2031 (PB–89-226930/XAB) **Environmental Monitoring Plan for the Dow Syngas Project. Quarterly report: First quarter, 1986. Report for 1 January-31 March 1986.** LeBlanc, G. Louisiana Gasification Technology, Inc., Plaquemine, LA (USA). 29 May 1986. 33p. Available from NTIS, PC A03/MF A01.

See also PB–89-191241.

The Energy Security Act of 1980 established a program to provide financial assistance to private industry in the construction and operation of commercial-scale synthetic-fuels plants. The Dow Syngas Project design is a high-temperature entrained-flow slagging-type gasifier that began operating in 1987. Dow agreed to comply with existing environmental regulations and to develop an Environmental Monitoring Plan (EMP) incorporating supplemental monitoring in areas of potential environmental and health concern, relative to synthetic-fuels facilities. The phases of monitoring in the EMP will test parameters of interest in air, water, and solid waste for evaluating plant operations and for establishing a data base of information for resolving environmental uncertainties relative to replication of synthetic-fuels plants. This report describes activities associated with continuation of construction at the commercial facility, permits applied for or received, and progress in laboratory construction methods development.

2032 (PB–89-226948/XAB) **Environmental Monitoring Plan for the Dow Syngas Project. Quarterly report: Second quarter, 1986. Report for 1 April-30 June 1986.** LeBlanc, G. Louisiana Gasification Technology, Inc., Plaquemine, LA (USA). 28 Aug 1986. 38p. Available from NTIS, PC A03/MF A01.

for evaluating plant operations and for establishing a data base of information for resolving environmental uncertainties relative to replication of synthetic-fuels plants. This Annual Health and Safety Report includes summaries of activities pursuant to the industrial-hygiene survey and the Project safety program during startup and initial operation of the plant. Area and personnel monitoring for potentially harmful agents are described, and detailed sampling data are appended to the report.

2040 (PB–89-227029/XAB) **Environmental Monitoring Plan for the Dow Syngas Project. Quarterly report: Second quarter, 1988. Report for 1 April-30 June 1988.** LeBlanc, G. Louisiana Gasification Technology, Inc., Plaquemine, LA (USA). 30 Aug 1989. 139p. Available from NTIS, PC A07/MF A01.

See also PB–89-227011. Portions of this document are not fully legible.

The Energy Security Act of 1980 established a program to provide financial assistance to private industry in the construction and operation of commercial-scale synthetic-fuels plants. The Dow Syngas Project design is a high-temperature entrained-flow slagging-type gasifier that began operating in 1987. Dow agreed to comply with existing environmental regulations and to develop an Environmental Monitoring Plan (EMP) incorporating supplemental monitoring in areas of potential environmental and health concern, relative to synthetic-fuels facilities. The phases of monitoring in the EMP will test parameters of interest in air, water, and solid waste for evaluating plant operations and for establishing a data base of information for resolving environmental uncertainties relative to replication of synthetic-fuels plants. This report describes Commissioning Phase activities completed, including 1594 samples taken and 4422 tests performed for air and water pollutants. Data from the test results will be available at the end of the Commissioning Phase. The Test Plan for compliance monitoring of the incinerator and turbine is appended to the report, as is the Gaseous Monitoring Test Plan.

2041 (PB–89-227037/XAB) **Environmental Monitoring Plan for the Dow Syngas Project. Quarterly report: Third quarter, 1988. Report for 1 July-30 September 1988.** LeBlanc, G. Louisiana Gasification Technology, Inc., Plaquemine, LA (USA). 29 Nov 1988. 158p. Available from NTIS, PC A08/MF A01.

The Energy Security Act of 1980 established a program to provide financial assistance to private industry in the construction and operation of commercial-scale synthetic-fuels plants. The Dow Syngas Project design is a high-temperature entrained-flow slagging-type gasifier that began operating in 1987. Dow agreed to comply with existing environmental regulations and to develop an Environmental Monitoring Plan (EMP) incorporating supplemental monitoring in areas of potential environmental and health concern, relative to synthetic-fuels facilities. The phases of monitoring in the EMP will test parameters of interest in air, water, and solid waste for evaluating plant operations and for establishing a data base of information for resolving environmental uncertainties relative to replication of synthetic-fuels plants. Activities related to obtaining 1311 samples and performing 3957 tests are highlighted in the document. Dispersion modeling of 10-Second Syngas Emergency Release is described, and the ground-water monitoring annual report is included.

2045 (PB–89-227086/XAB) **Cool Water Coal Gasification Program: Environmental Monitoring Plan. Volume 1-5, Section 1-12, Appendices A-F. Report for 1984-89.** Cool Water Coal Gasification Program, Daggett, CA (USA). 7 Jul 1989. 1702p. Available from NTIS, PC A99/MF E12.

Also pub. as Radian Corp., Sacramento, CA. rept. no. DCN-89-218-049-106. See also PB–89-160899.

The Energy Security Act of 1980 established a program to provide financial assistance to private industry in the construction and operation of commercial-scale synthetic-fuels plants. The Cool Water Coal Gasification Program is one of the four projects awarded financial assistance. The Program agreed to comply with existing environmental-monitoring regulations and to develop an Environmental Monitoring Plan incorporating supplemental monitoring in the areas of water, air, solid waste, worker health and safety, and socioeconomic impacts during the period 1984-1989. As the first commercial-scale integrated gasification combined-cycle plant for generating energy from coal, the plant is designed to process a variety of coals with no liquid discharge, produce non-hazardous solid

wastes, and produce very few air emissions. This report concludes the analysis of potential environmental impacts due to operation of this particular technology. Indicator parameters and correlations are discussed along with summaries of results while operating the main and quench gasifiers, and burning four types of coal. The extensive data demonstrate environmental acceptability of integrated coal gasification using both high-sulfur Eastern coals and low-sulfur Western coals; 97% sulfur removal was achieved.

2046 (PB–89-227094/XAB) **Cool Water Coal Gasification Program: Environmental monitoring plan. Final Report, non-proprietary. Executive summary. Report for 1984-1989.** Cool Water Coal Gasification Program, Daggett, CA (USA). 7 Jul 1989. 59p. Available from NTIS, PC A04/MF A01.

Also pub. as Radian Corp., Sacramento, CA. rept. no. DCN-89-218-049-107. See also PB–89-227086.

The Energy Security Act of 1980 established a program to provide financial assistance to private industry in the construction and operation of commercial-scale synthetic-fuels plants. The Cool Water Coal Gasification Program is one of the four projects awarded financial assistance. The Program agreed to comply with existing environmental-monitoring regulations and to develop an Environmental Monitoring Plan incorporating supplemental monitoring in the areas of water, air, solid waste, worker health and safety, and socio-economic impacts during the period 1984-89. As the first commercial-scale integrated gasification combined-cycle plant for generating energy from coal, the plant is designed to process a variety of coals with no liquid discharge, produce non-hazardous solid wastes, and produce very few air emissions. This Executive Summary highlights five years of operations, using main and quench gasifiers and four types of coals. Summary tables demonstrate that environmental performance met all permit requirements, and performance of major pollution-control systems met or exceeded design pollutant-removal efficiencies. Fugitive emissions, waste water, solid waste, ambient air, and indicator parameter monitoring are also discussed. No areas of major environmental concern were identified.

2047 (PB–89-232631/XAB) **Advanced gasifier-desulfurizer process development for SNG (substitute natural gas) application. Final report, August 1987-December 1988.** Blinn, M.B.; Cover, A.E.; Haldipur, G.B.; Datta, S.C.; Holmgren, J.D. KRW Energy Systems, Inc., Pittsburgh, PA (USA). Jun 1989. 210p. (KRW–89-001). Available from NTIS, PC A10/MF A01.

KRW conducted investigations of calcium-promoted coal pyrolysis and gasification by means of bench-scale studies and an oxygen-blown PDU test. Results were used in a design study of a commercial KRW gasifier-desulfurizer, operating on Pittsburgh No. 8 coal and limestone for production of SNG. Bench-scale fluid-bed reactor studies were conducted with various fluidizing gases at temperatures and pressures of 1650 to 1950 F and 40 to 450 psig, with and without limestone, to give methane-yield and tar-yield data. The gasification kinetics studies of chars produced gave data which showed that limestone increases char reactivity and exerts a catalytic effect. Methane yields correlated exponentially to pressure. The bench-scale test results lead to an expectation that feeding some of the coal to the upper portion of the gasifier will increase methane yield and decrease oxygen consumption. In two PDU test-set points, expected operability and performance of the oxygen-blown gasifier-desulfurizer were confirmed. In Set Point 2, in-bed desulfurization efficiency was 88% and the product-gas higher heating value was 302 Btu/scf. The test results provided inputs to the design study of a KRW gasifier-desulfurizer island for production of 125 MM Btu/day of SNG. Results included a 4 to 6% improvement in feedstock inputs when compared to an earlier GRI-sponsored study. Methane yield decreased but the number of operating gasifier-desulfurizers remained at five. Equipment costs are expected to remain well within the previous + or - 25% cost estimate.

2048 **The effect of system parameters on fines generation in limestone/coal char mixtures.** Sishtla, C.; Chan, I.; Findlay, J.; Knowlton, T.M. 28p. American Institute of Chemical Engineers, New York, NY (1988). (CONF-881143–: American Institute of Chemical Engineers annual meeting, Washington, DC (USA), 27 Nov - 2 dec 1988).

Technical Paper 162G.

This paper describes tests conducted in a high-temperature, 6-inch-(15-cm) diameter test unit and a high-pressure, 60-inch-(15-cm) diameter unit to determine the effect of gas density on the fines generation rate of -20+35 mesh mixtures of coal chars and limestone. Both bituminous and lignite coal chars were tested. Limestone concentrations of 20, 35, and 50 weight percent were used in the investigation. Data were obtained using a multi-hole gas distributor over a temperature range of 70 to 1400 degrees Fahrenheit (21 to 760 degrees Centrigrade) and a pressure range of 5 to 350 psig (34 to 2410 KPa).

2049 **An investigation of coal-oil reaction pathways using model compounds.** Kim, H.; Curtis, C.W. 28p. American Institute of Chemical Engineers, New York, NY (1988). (CONF-881143–: American Institute of Chemical Engineers annual meeting, Washington, DC (USA), 27 Nov - 2 dec 1988).

Technical Paper 167E.

The reactants in the coprocessing of coal with petroleum residuum are composed of two complex and diverse materials with coal being more aromatic with a low H/C ratio and residuum more aliphatic with a higher H/C ratio. In this paper the interactive chemistry between these diverse materials is investigated in both thermal and catalytic reactions using model reactant systems at coprocessing reaction conditions. The model systems are composed of aromatics, partially saturated aromatics and nitrogen, sulfur, and oxygen containing heteroatomic species. The catalyst used was an in situ generated MoS_{2+chl} whose precursors were Mo naphthenate or Mo octoate and elemental sulfur. Reaction products and pathways are determined for both thermal and catalytic reactions.

2050 (PB–89-220966/XAB) **Detailed control technology survey of a coke-oven plant.** Sheehy, J.W. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Physical Sciences and Engineering. Jul 1979. 37p. (ECTB–123-05B). Available from NTIS, PC A03/MF A01.

Portions of this document are not fully legible.

A coke-oven control technology field survey at a fully integrated steel facility was performed to determine exposure of workers to coal tar pitch volatiles (CTPV). Area and personal samples were collected for CTPV, and weather data were obtained from a nearby airport weather station. The airflow of the filter and air-conditioner units was measured in the lunchroom facility. Coke-oven benchmen throwing coal into the oven had a higher exposure when throwing coal over the side of the bench. Wind speed and direction had a major effect on top-side CTPV concentrations. The author recommends that area samplers be placed above at least every third coke oven door to effectively measure visible door emissions.

2051 (CONF-891001–9) **Gas content in sealed Argonne Premium Coal Samples.** Vorres, K.S. Argonne National Lab., IL (USA). [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From International conference on coal science; Tokyo (Japan); 23-27 Oct 1989. Order Number DE90002862. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Argonne Premium Coal Samples in ampoules of 5 grams of −100 mesh and 10 grams of −20 mesh were periodically opened in vacuum and analyzed with a mass spectrometer as part of a quality monitoring program. The samples were originally sealed under nitrogen in a glove box maintained at less than 40 ppM of oxygen. Moisture present in the coal was kept in the samples as much as possible. Determinations of the gases were made and provide an opportunity to observe the changes due to transformations, release of dissolved gases or other processes in the samples. Changes in the gas content were observed and may be useful in interpreting a variety of phenomena. 1 ref., 2 figs., 1 tab.

2052 (CONF-891001–10) **Isotope labeling investigations in simulated coalification: A view of geological metamorphism.**

Botto, R.E.; Hayatsu, R.; Carrado, K.A.; Winans, R.E. Argonne National Lab., IL (USA). 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From International conference on coal science; Tokyo (Japan); 23-27 Oct 1989. Order Number DE90002863. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In the present work, conifer lignin samples that have been subjected to coalification to varying degrees have been examined by solid-state ^{1}H and ^{13}C nuclear magnetic resonance (NMR) spectroscopy to monitor chemical changes associated with their thermal maturation. The results are compared with similar data taken for eight Argonne Premium coals. In parallel experiments, a synthetic sample of [methoxy-^{13}C] lignin and m-(methoxy-^{13}C) toluene have been coalified under similar conditions and have been analyzed by ^{13}C NMR. 9 refs., 4 figs.

2053 (CONF-891046–4) **Advanced research in instrumentation and control technology.** Sheen, Shuh-Haw; Raptis, A.C. Argonne National Lab., IL (USA). Oct 1989. 19p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. From Advanced research and technology development; Morgantown, WV (USA); 3-5 Oct 1989. Order Number DE90002774. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The objective of this program is to conduct advanced research in instrumentation and diagnostic technology needed in coal combustion, pyrolysis, and cleanup processes. The program includes development of control instruments for specific process parameters such as flow rate, temperature, and viscosity, and also development of integrated diagnostic systems for unit process control. The present focus of the program is to develop an on-line ultrasonic viscometer for monitoring the rheological properties of coal slurry. This viscometer may be developed through measurements of acoustic impedance, attenuation, relaxation, and cavitation properties of the slurry being tested. Acoustic impedance and cavitation methods were examined in FY 1989.

2054 (DOE/ER/13777–2) **Prediction of thermodynamic properties of coal derivatives: Progress report, March 1, 1989–February 28, 1990.** Donohue, M.D. Johns Hopkins Univ., Baltimore, MD (USA). Dept. of Chemical Engineering. Nov 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13777. Order Number DE90003355. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this report, we present our efforts and progress toward understanding molecular behavior and its effect on thermodynamic properties. To this end, we have developed a number of theories applicable to the types of molecules found in coal processing. To put out current work into context, we present here a brief review of our previous work. Initially the Perturbed Soft Chain Theory (PSCT), a perturbation theory for chain molecules based on the Lennard-Jones potential function was formulated. This was followed by the development of the Perturbed Anisotropic Chain Theory (PACT) which extended the applicability of PSCT to mixtures containing polar molecules. Next, PACT was generalized to include the effect of chemical association (hydrogen bonding) resulting in the Associated Perturbed Anisotropic Chain Theory (APACT). In order to reduce the mathematical complexity of these equations and hence increase their usefulness to practicing engineers, the Simplified Perturbed Hard Chain Theory (SPHCT), which is applicable to non-polar chain molecules, and COMPACT, an equation for hydrogen bonding fluids were developed. In addition to our theoretical work, experiments have been performed to study the phase behavior of binary, ternary and quaternary mixtures containing model coal compounds. Other experimental work involved measurements of selective solubility enhancement of coal chemicals in high-pressure fluids, the partitioning of a dilute solute between two solvents and spectroscopic measurements of chemical association. The various theories developed and experimental work performed under this research program during the current contract period are described briefly in the following sections.

2055 (DOE/PC/88922–4) **Supercritical fluid thermodynamics for coal processing: Quarterly progress report, July 1, 1989–September 30, 1989.** Eckert, C.A. Illinois Univ., Urbana, IL (USA). Dept. of Chemical Engineering. 15 Sep 1988. 5p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88922. Order Number DE90002766. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Because of their unusual solvating and mass transfer properties, supercritical fluids show potential for a variety of coal processing applications. We have established a database of coal model compound equilibrium and are beginning modeling efforts. In addition, we have used fluorescence spectroscopy to study the nature of the intermolecular interactions in the system of pyrene in supercritical C_2H_4. The spectroscopy measurements are being used to guide the development of an equation of state that can be used to predict the solubility behavior so systems can be designed for the processing of coal with supercritical fluids. 1 fig.

2056 (DOE/PC/88934–T3) **Enhancement of surface properties for coal beneficiation: Progress report, August 1, 1989–September 30, 1989.** Chander, S.; Aplan, F.F. USDOE Pittsburgh Energy Technology Center, PA (USA). [1989]. 5p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88934. Order Number DE90003039. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The main objective of this research program is to study ways to modify surface properties of coal, pyrite and ash-forming mineral matter for beneficiation of fine coal. Since the differences in surface properties of coal and mineral matter are utilized in several oil based preparation technologies, such as: froth flotation, emulsion flotation, spherical agglomeration and liquid-liquid separation, another objective is to delineate the role of oil. The role of oil can be as a surface modifying agent, an agglomerating medium (bridging liquid) or a collecting phase for coal particles.

2057 (DOE/PC/88941–T4) **A study of coal particle shape and three-body wear: Quarterly report, August–October 1989.** Clark, N.N.; Means, K.H. West Virginia Univ., Morgantown, WV (USA). Dept. of Mechanical and Aerospace Engineering. [1989]. 26p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88941. Order Number DE90002759. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The effect of coal particle shape on the three body wear project has completed its first year. Several milestones in the project have been completed. The wear machine has been designed and built and is undergoing calibration runs at present. The particle shape study is well underway. An algorithm has been developed for shape description. 1 ref., 3 figs.

2058 (DOE/PC/89904–T4) **High-sulfur coal research at the SIUC [Southern Illinois University at Carbondale] Coal Technology Laboratory: Quarterly progress report, July 1–September 30, 1989.** Southern Illinois Univ., Carbondale, IL (USA). Coal Extraction and Utilization Research Center. Oct 1989. 135p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-89PC89904. Order Number DE90003310. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

Research on high-sulfur coal at the Coal Technology Laboratory at Southern Illinois University at Carbondale (SIUC) is divided into three general categories: coal science, coal preparation, and coal utilization. The work in these three areas covers a broad spectrum of high-sulfur coal research, from the very fundamental aspects of coal, through its physical beneficiation, to its ultimate utilization. Individual projects are processed separately for the databases.

2059 (DOE/PC/90519–T11) **Electrochemical characterization and derivatization of coal: Final technical report, September 15, 1986–September 14, 1989.** Park, Su-Moon. New Mexico Univ., Albuquerque, NM (USA). Dept. of Chemistry. [1989]. 86p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC90519. Order Number DE90002791. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Electrochemical characterization and derivatization studies have been carried out on several different New Mexico coal samples. Results indicate that coal can be oxidized electrochemically in alkaline solutions to produce humic acids at the anode and hydrogen at the cathode. Humic acids may be reductively hydrogenated or used as a soil conditioner to hold minerals and acidify soil in the southwestern region, whereas hydrogen could be used as a fuel. Various parameters affecting this reaction have been studied and the results

are discussed. When coal is reduced in nonaqueous solution with solution catalysts, such as anthracene or naphthalene, and proton donors, such as isopropyl alcohol present, it is hydrogenated and the H/C-ratio becomes higher. The results were confirmed both by elemental analysis and FTIR spectroscopy. While it was shown that these reactions can occur, it would take more work to make these reactions practical. Finally, theory of electrode processes has been developed in an effort to analyze the electrochemical current when coal is electrolyzed, or when a catalyst molecule is electrolyzed with coal slurries present in a solution.

2060 (DOE/PC/90521–T12) **Role of porosity in supercritical fluid extraction of coal: Final technical report.** Bale, H.D. North Dakota Univ., Grand Forks, ND (USA). Dept. of Physics. 2 Oct 1989. 28p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC90521. Order Number DE90003322. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The major emphasis of our recent work has been directed towards establishing the role that the micropore structure plays in fluid extraction of coal. The project incorporated in situ small angle x-ray scattering experiments and online ultraviolet and infrared absorption measurements. The largest number of experiments were performed on Wyodak subbituminous coal from Clovis Point. The solvent used in the extraction experiments was tetrahydrofuran (THF) which was chosen because it was satisfactory for both the on-line ultraviolet measurements and the x-ray scattering system. Discussed in this report are the characteristics of extracted material; in-situ small angle scattering during fluid extraction, micropore formation at 380°C; the extraction process and pore filling of untreated coal. 8 figs. (CBS)

2061 (DOE/PC/90527–T8) **Characterization of oxidized coal surfaces: Final report.** Hercules, D.M. Pittsburgh Univ., PA (USA). Dept. of Chemistry. 25 Sep 1989. 64p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC90527. Order Number DE90002400. Available from NTIS, PC A04/MF A01 - OSTI.

This report encompasses work in the development of mass spectrometry methodology for characterization of specific compounds formed during the surface oxidation of coal, a process that alters physical and chemical properties important in direct utilization and conversion of the coal. Modern microprobe mass spectrometry methods of Laser Mass Spectrometry (LMS) and Secondary Ion Mass Spectrometry (SIMS) have been used in this investigation in combination with selected derivatization reaction to achieve specific chemical characterization from the complex coal matrix. 32 refs., 27 figs., 4 tabs.

2062 (EGG-M–88261) **Numerical comparisons between the pyrolysis mass spectra of twelve US coals and their relative solubility in microbial cultures or alkaline buffer.** Yeh, G.J.C.; Ward, B.; Quigley, D.R.; Crawford, D.L.; Meuzelaar, H.L.C. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-880912–31: 196. American Chemical Society national meeting, Los Angeles, CA (USA), 25-30 Sep 1988). Order Number DE90002146. Available from NTIS, PC A02/MF A01 - OSTI.

Curie-point pyrolysis mass spectra of twelve low-rank US coals with various degrees of natural weathering were correlated with the results of biosolubility screening tests involving six selected microorganisms as well as with a specially designed alkaline solubility test. The main objective of this study was to determine which mass spectral characteristics, if any, correlate with the degree of biosolubility. The results indicate the possible presence of two biosolubilization trends, a main trend which correlates positively with the presence of severely oxidized aromatic moieties in the coal and apparently enables biosolubilization by all six microorganisms, and a second trend which correlates with relatively high concentrations of acid components and enables biosolubilization by only two or three of the organisms. The chemical and biological significance of these trends is not yet completely understood. Finally, in agreement with previous reports a strong positive correlation was observed between biosolubility and alkaline solubility. 10 refs., 7 figs., 4 tabs.

2063 (EGG-M–88469) **Relationships between natural weathering and lignite biosolubility or alkali solubility.** Ward, B.; Quigley, D.R.; Dugan, P.R. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 16p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC07-76ID01570. (CONF-881205–3: Symposium on coal, oil, and gas biotechnology, New Orleans, LA (USA), 5-7 Dec 1988). Order Number DE90002027. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Samples of weathered lignites collected from various outcrops or mine areas were biosolubilized to various degrees by two different fungi. Although apparent degree of weathering usually correlated directly with coal biosolubility, some of the most highly weathered lignites were the most resistant to microbial attack. This apparent anomaly was investigated by testing biosolubility of two different lignites collected from various depths into weathered seams. The surface layers, which appeared to be the most highly weathered, were less biosoluble than were samples taken from the next few centimeters into the seams. Biosolubility of deeper layers decreased with increasing seam depth. One of the coals was also tested for alkali solubility, and the resulting weathering-gradient solubility profile paralleled that of biosolubility. Chemical analyses revealed apparent direct relationships among coal oxygen content, apparent degree of weathering, and solubilization. Pretreatments with hydrochloric acid to extract metal ions resulted in enhanced alkali solubility of all samples but those from the deepest layer. Chemical analyses of acid-extracts indicated a role of metal cations in coal biosolubility. Formation of insoluble metal cation-oxidized coal complexes could reduce biosolubility (or alkali solubility) of weathered coals. 14 refs., 3 figs., 4 tabs.

2064 (ORNL/FTR–3458) **[Coal structure and basic reactions]: Foreign trip report, October 20, 1989–October 28, 1989.** Chambers, R.R. Jr. Oak Ridge National Lab., TN (USA). 7 Nov 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002963. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This document describes a trip to Tokyo, Japan, for the purpose of attending the 1989 International Conference on Coal Science and presenting a talk entitled "Coal Structural Inferences Derived from the Alkylation of Acidic C-H Bonds with $pK_a \leq 35'$. The areas of coal science that were highlighted during the conference were coal structure and characterization, basic reactions of coal, coal liquefaction, beneficiation, pyrolysis, gasification, and combustion. Presentations given in the sections on coal structure and characterization and pyrolysis were particularly relevant to the current coal research efforts in the Chemistry Division at ORNL. Additional benefit was possible from informal discussions with researchers whose interests are in the application of alkylation chemistry and NMR techniques for coal structure analysis.

2065 (ORNL/FTR–3459) **[Coal science]: Foreign trip report, October 20, 1989–October 31, 1989.** Buchanan, A.C. III. Oak Ridge National Lab., TN (USA). 9 Nov 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002964. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended the 1989 International Conference on Coal Science, which covered a broad spectrum of topics in fundamental and applied coal science. Of particular interest and relevance to the DOE sponsored Organic Coal Chemistry Program at ORNL were symposia on Coal Structure and Characterization and Basic Reactions of Coal. The traveler presented a paper on his research to a large international audience, chaired a technical session, and participated in numerous informal discussions of benefit to the Coal Chemistry Program. Visits with staff at the technology centers indicated above provided insights into the current status of Japanese efforts in coal liquefaction and gasification.

2066 **Apparatus for direct measurement of ash fusion and sintering behavior at elevated temperatures and pressures.** Khan, M.R. (Texaco, Inc., P.O. Box 509, Beacon, New York 12508 (US)). *Review of Scientific Instruments (USA)*, 60(10): 3304-3309 (Oct 1989).

Ash fusion, sintering, and deposition may impose serious operational difficulties in conventional and advanced coal-combustion systems. Conventional ash fusion techniques (e.g., ASTM methods) determine the qualitative behavior of ash samples at atmospheric pressure. Presently, there is no known available technique that can measure the behavior of coal ash at elevated temperatures and pressures. In the literature, methods based on electrical resistance

or shrinkage of coal ash have been reported at atmospheric pressure (elevated temperatures) conditions. A high-pressure microdilatometer (HPMD) has been developed to investigate ash fusion and sintering behavior at elevated pressures and temperatures by the simultaneous measurement of the temperature of initial contraction and electrical resistivity of samples. This novel technique facilitates the measurement of ash properties over a wide range of temperature, pressure, and gas atmosphere (oxidizing, reducing, or inert). The operating principle of the HPMD includes measuring the temperature at which there is a significant "shift" in the electrical resistivity (and/or sample volume) that represents ash sintering and fusion. Sintering occurs through the formation of solid-state, particle-to-particle "necks" or the appearance of a molten phase, which allows a path for electrical conductance. The ability to perform both resistivity and shrinkage measurements simultaneously or independently at *elevated pressures* makes the HPMD truly unique. The HPMD can also be used to investigate the swelling and softening behavior of pyrolyzing coal at elevated pressures and relatively rapid heating rates.

2067 (DOE/PC/79921–T6) **Pore structure and reactivity changes in hot coal gas desulfurization sorbents: Technical progress report, July–September 1989.** Sotirchos, S.V. Rochester Univ., NY (USA). Dept. of Chemical Engineering. Sep 1989. 16p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79921. Order Number DE90001946. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The primary objective of the project is the investigation of the structural and reactivity changes occurring in metal/metal oxide sorbents used for desulfurization of hot coal gas during sulfidation and regeneration with particular emphasis placed on the effects of these changes on the sorptive capacity and efficiency of the sorbents. The following tasks have been identified in the project: (1) Conversion vs. Time Studies during Sulfidation and Regeneration; (2) Pore Structure Evolution Studies during Sulfidation and Regeneration; (3) Intraparticle Diffusion Studies; (3) Intraparticle Diffusion Studies; (4) Developments of Structural Models for Hot Coal Gas Desulfurization Sorbents; and (5) Development of Mathematical Models for Fixed-Bed Desulfurization Reactors. During the third quarter of the 1989 academic year, our research efforts primarily focused on Tasks 1, 2, and 3. 11 refs., 5 figs.

2068 (DOE/PC/91101–T8) **Sulfur dioxide removal from flue gases by supported copper and iron absorbents: Final technical report, May 16, 1986-December 31, 1988.** Melson, G.A. Virginia Commonwealth Univ., Richmond, VA (USA). Dept. of Chemistry. [1988]. 19p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC91101. Order Number DE90001400. Available from NTIS, PC A03/MF A01 - OSTI.

This project was initiated in response to a need to address the problem of attrition for copper oxide/alumina sorbents for the PETC fluidized bed copper oxide process. The attrition problem is a major drawback to the economic feasibility of the process. Previous attempts to reduce sorbent attrition focused on engineering modifications; however, it was proposed that the method of impregnation and pre-treatment of a copper oxide/alumina sorbent may have a significant effect on the reactivity and stability of the sorbent and thus the attrition rate. Prepared sorbents would be characterized by a variety of techniques. Sorption of sulfur dioxide from simulated flue gas mixtures and regeneration of the sorbents with hydrogen and methane would be studied, particularly by thermogravimetric techniques. Evaluation of the rate of attrition for the prepared sorbents would be made. 5 refs., 9 figs.

2069 (EPRI-GS–6540) **Use of ash in highway construction: Delaware demonstration project: Final report.** Srivastava, L.; Collins, R.J. Electric Power Research Inst., Palo Alto, CA (USA); Delmarva Power and Light Co., Wilmington, DE (USA); VFL Technology Corp., Malvern, PA (USA). c Nov 1989. 126p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

EPRI has initiated a broad-based research and demonstration program aimed at promoting the utilization of high volumes of coal ash in highway construction applications, such as road bases, subbases, embankments and backfills. Included within the EPRI program is a Delaware study involving the construction and performance monitoring of a demonstration project in which Class F fly ash was used as an embankment material within a new highway interchange project. The primary objective of this project was to construct and monitor the structural and environmental behavior of this embankment. Design and construction activities associated with this embankment are discussed in this report. The report also describes all tests and other activities related to background, construction and post-construction monitoring work on this project. The final results from all monitoring activities are summarized in this report. The monitoring data demonstrates that fly ash embankment material provides equivalent structural performance to that of granular borrow material. At the same time, the data confirms that fly ash is an environmentally acceptable alternative to natural soil when used in a highway embankment. 13 refs., 11 figs., 3 tabs.

2070 (EPRI-GS–6569-Vol.1) **FGD [flue gas desulfurization] damper guidelines: Volume 1, Fundamentals and survey results: Final report.** Smith, E.O.; Cannell, A.L.; Ferguson, A.W. Electric Power Research Inst., Palo Alto, CA (USA); Black and Veatch, Kansas City, MO (USA). c Nov 1989. 244p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Dampers have been a major problem in the operation of flue gas desulfurization (FGD) systems, causing frequent system shutdowns. FGD damper reliability is critical to maintaining high unit availability. The overall objectives of this project are to determine the reasons for damper problems experienced in FGD service and to formulate guidelines to alleviate these problems in new and retrofit FGD installations. To accomplish these objectives, electric utilities with operational FGD systems were surveyed to determine the types of dampers being used in FGD applications and observations based on operating experience with such applications. From the survey information, nine plants were selected for in-depth field inspection and investigation of operating experience. Damper equipment suppliers were also surveyed in order to benefit from their experience in designing and trouble-shooting damper equipment in FGD service. Damper fundamentals and results of field investigations and utility/supplier surveys are presented in Volume 1 of this report. Major problem areas are identified and operating successes are discussed.

2071 (EPRI-GS–6569-Vol.2) **FGD damper guidelines: Volume 2, Guidelines: Final report.** Smith, E.O.; Cannell, A.L.; Ferguson, A.W. Electric Power Research Inst., Palo Alto, CA (USA); Black and Veatch, Kansas City, MO (USA). c Nov 1989. 162p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Dampers have been a major problem in the operation of flue gas desulfurization (FGD) systems, causing frequent system shutdowns. FGD damper reliability is critical to maintaining high unit availability. The overall objectives of this project are to determine the reasons for damper problems experienced in FGD service and to formulate guidelines to alleviate these problems in new and retrofit FGD installations. To accomplish these objectives, electric utilities with operational FGD systems were surveyed to determine the types of dampers being used in FGD applications and observations based on operating experience with such applications. From the survey information, nine plants were selected for in-depth field inspection and investigation of operating experience. Damper equipment suppliers were also surveyed in order to benefit from their experience in designing and trouble-shooting damper equipment in FGD service. Damper selection guidelines, including a guide specification and information on operation and maintenance, are presented in Volume 2. The guidelines provide specific information to assist the engineer in selection of the type of dampers required for the FGD system, recommended materials of construction, and design and construction criteria. The guide specification can be used to develop

a procurement specification that thoroughly covers the technical requirements for the dampers and ensures that adequate information is obtained to permit rigorous evaluation of proposals.

2072 (ETDE-mf–0721863) **Basic investigation of mixtures consisting of binders and tailings from coal mining with regard to their applicability as building materials in the mining industry.** Ernst, L. Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany, F.R.). Fakultaet fuer Bergbau, Huettenwesen und Maschinenwesen. 4 Mar 1988. 205p. (In German). Order Number DE90721863. Available from NTIS (US Sales Only), PC A10/MF A01.

The object of the laboratory tests carried out was to analyze to what extent processing tailings which are consolidated by binders meet the requirements on typical construction materials of the mining industry. After a detailed analysis of the tailings and the flotation tailings (mineralogical, petrographic, grain shape, grain size distribution, sensitivity to water) mixtures with water and cement as well as possibly additives and varying grain sizes were prepared and their consistency was determined. In the tests with hardened mixtures, most of the uniaxial compression tests were carried out with cylindrical test specimens and the influence of various quantities on the strength were analysed. The density of the test specimen, the water-cement ratio and the cement content have a considerable effect on the attainable strengths. In order to obtain extensive knowledge about the material properties of processing tailings consolidated by binders, triaxial compression tests were carried out in addition to uniaxial compression tests and tensile splitting and tensile bending strengths were determined. (orig./RB).

2073 (OY/PSTL-TIED–63) **Peat - Environment - Society. Part 2: Emissions from combustion of peat.** Paajala, J.; Kauppi, M. Oulu Univ. (Finland). Research Inst. of Northern Finland. 1989. 93p. (In Finnish). Order Number DE90719343. Available from NTIS (US Sales Only), PC A05/MF A01.

This research is studying emissions formed in combustion of peat and other fuels used in power plants, the formation mechanisms of emissions, and possibilities to reduce them. The aim of the research has also been to indicate the role of combustion of peat as a source of emissions in Finland. The portion of emissions formed in combustion of peat in Finland seems to be about the same as the portion of energy produced by combustion of peat of the total energy prodution. The development work in the field of combustion technology, directed to reduction technologies of nitrogen and sulfur oxides, is the main target in reduction of emissions. This report is a literature survey of emissions from peat and analogous fuels.

2074 (STEV-FBT–89-26) **Ammonia addition for NO_x reduction in fluidized bed boilers.** Aamand, L.E.; Leckner, B. Statens Energiverk, Stockholm (Sweden). 1989. 9p. (CONF-8803160–1: 1. European conference on industrial furnaces and boilers, Lisbon (Portugal), 21-24 Mar 1988). Order Number DE90719436. Available from NTIS (US Sales Only), PC A02/MF A01.

Ammonia is added to the gases in the combustion chamber of fluidized bed boilers in order to investigate its effect on the emission of nitrogen oxides. A stationary and a circulating fluidized bed boiler are used. In the stationary fluidized bed boiler an addition corresponding to a (NH_3/NO_{exit}) molar ratio of 3 gives a 50% reduction of the NO emission. Larger doses lead to escape of ammonia and other disadvantages. In the circulating fluidized bed boiler no effect from injection of ammonia into the combustion chamber is noted. The ammonia is decomposed. If NH_3 is to be used in circulating fluidized bed boilers it should be introduced in the particle-free gas after the particle separator.

2075 **Removal of acidic gases from incinerator flue gas in a fluidized bed scrubber.** Bradshaw, W.M.; Krishnan, R.P.; Young, J.M. 11p. American Institute of Chemical Engineers, New York, NY (1988). (CONF-881143–: American Institute of Chemical Engineers annual meeting, Washington, DC (USA), 27 Nov - 2 dec 1988).

Technical Paper 162E.

This paper describes a parametric study conducted in a 5-cm bubbling bed to determine the feasibility of scrubbing acidic gases from incinerator flue gas by direct contact with an alkaline sorbent in a fluidized bed. The effects of process parameters on removal of HCl, P_2O_5, and SO_2 were investigated experimentally. The relationship between removal efficiency and sorbent utilization was determined at 542°C (1000°F) and twice the minimum fluidization velocity.

2076 **A process for the preparation of cysteine from cystine.** Chang, S.G.; Liu, D.K.; Griffiths, E.A.; Littlejohn, D. To Dept. of Energy, Washington, DC. USA Patent 4,837,361. 6 Jun 1989. Filed date 18 Nov 1987. USA Patent Application 7 122,725. Int. Cl. C07C 147/02;C07C 149/24;C07C 149/243. 16p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes an invention which in one aspect relates to a process for the simultaneous removal of NO_{cN} and SO_2 from a fluid stream comprising mixtures thereof and in another aspect relates to the separation, use and/or regeneration of various chemicals contaminated or spent in the process. It includes the steps of: Contacting the fluid stream at a temperature of between about 105° and 180°C with a liquid aqueous slurry or solution; separating the fluid stream from the particulates formed; washing and separating the particulates with an aqueous solution having a pH value of between about 5 to 8; subsequently washing and separating the particulates with a strongly acidic aqueous solution; washing and separating the particulates with a basic aqueous solution; optionally adding additional amino acid moiety, iron (II) and alkali to the aqueous liquid to produce an aqueous solution or slurry having a pH value of between about 4 to 12; and recycling the aqueous slurry of the last step to the contacting zone of the first step.

2077 (DOE/FE/60850–T1) **[Analysis of acid rain and associated phenomena]: Final report.** General Sciences Corp., Laurel, MD (USA). Sep 1989. 14p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC01-85FE60850. Order Number DE90002555. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Department of Energy, Office of Fossil Energy, Office of Coal Utilization, Advanced Conversion and Gasification (OCUAC&G) is and has been engaged in numerous research and development programs which will greatly increase the use of coal and other abundant fossil energy resources. In combination, these technology programs and energy systems characterize OCUAC&G's approach to accomplishing their strategic objectives of: clean coal, new fuel forms for coal, new coal utilization processes, coal gasification, modular equipment systems, and environmental protection. Under this contract, GSC is to assist OCUAC&G in meeting their strategic objective by providing services related to three task areas: literature surveys, acid rain analysis, and interfacing of energy systems. During this period considerable attention was paid to performing literature surveys, analysis of emissions and deposition data, and the review of energy systems. Notable accomplishments are summarized below. 5 figs.

2078 (EPRI-GS–6578) **1988 interorganizational workshop on future utility SO_2 emissions.** McGowin, C.R.; Veselka, T.D.; Vankuiken, J.C.; Pechan, E.H.; Holmes, C. Electric Power Research Inst., Palo Alto, CA (USA); Argonne National Lab., IL (USA); Pechan (E.H.) and Associates, Inc., Springfield, VA (USA); National Coal Association, Washington, DC (USA). c Nov 1989. 63p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The Interim Assessment, published in 1987 by the National Acid Precipitation Assessment Program (NAPAP), compared model predictions of future utility SO_2 emissions in the US prepared by several organizations. The principal investigators responsible for the SO_2 emissions predictions met at two workshops during 1988 to develop an understanding of the logic and understanding of the models and to assess the uncertainties and impacts of the assumptions on future utility SO_2 emissions. The participants included representatives from Argonne National Laboratory (ANL), EPRI, NAPAP, National Coal Association (NCA), E.H. Pechan and Associates (Pechan), US Department of Energy (DOE), and US Environmental Protection Agency (EPA). The EPRI, EPA/Pechan, and ANL utility SO_2 emissions model predictions were compared over the period

1980 to 2050 using a uniform test case assumption set. All three models predicted that utility SO_2 emissions would decline to five million tons/year by 2040 under the test case assumptions. 5 refs., 12 figs., 12 tabs.

2079 (RRTAC–89-2) **Proceedings of the conference: reclamation, a global perspective.** Walker, D.G.; Powter, C.B.; Pole, M.W. (comps.). Alberta Land Conservation and Reclamation Council, Edmonton, AB (Canada). Reclamation Research Technical Advisory Committee. 1989. 2 vols., 872p. (CONF-890807–: Symposium on reclamation: a global perspective, Calgary (Canada), 27-30 Aug 1989). Available from Publication Services, Queens Printer, 11510 Kingsway Avenue, Edmonton, Alberta, Canada T5G 2Y5.

A total of 86 papers are presented in the proceedings: they come from conference sessions with the following titles - reclamation, a global perspective; northern and high altitude reclamation; fish and wildlife and rangeland reclamation; water; herbaceous revegetation; woody plant revegetation and succession; industrial and urban sites; problems and solutions; sodic and saline materials; soils and overburden; and acid generating materials - and a mine tailings reclamation symposium. 34 of the papers have been abstracted separately.

2080 **Environmental aspects of coal-fueled diesel engines.** Williams, M.C. (USDOE Morgantown Energy Technology Center, WV (USA)); Holcombe, N.T.; McMillian, M. vp of Advances in engine emissions control technology. Chrisman, B. Serve, J.V. American Society of Mechanical Engineers, New York, NY (1989). (CONF-8901105–: Advances in engine emissions control technology, Houston, TX (USA), 22-25 Jan 1989).

Conventional diesel engines are considered by some to be contributors to environmental problems since they emit NO_{chl}, a suspected acid rain precursor. Initial testing has shown that CWS-fueled diesels emit substantially reduced NO_{chl} emissions. While emissions of particulates and SO_{chl} may be potentially higher with coal fuels, assessment of the control technology indicates excellent potential for meeting existing and future standards for these emissions. As a result of activities managed by the Morgantown Energy Technology Center, the economic and technical feasibility of CWS-fueled diesel engines has been determined. The objective of this paper is to discuss the environmental concerns, emission goals, and the control methodologies, devices and strategies that will be used to ensure CWS-fueled diesel engines will meet current and potential environmental standards.

0110 Reserves and Exploration

2081 (ETDE-mf–0718167, pp. 43-66) **Technical and economic factors influencing the exploration of black-coal deposits in developing countries.** Stolte, G. (Montan-Consulting G.m.b.H., Essen (Germany, F.R.)). Technische Univ. Berlin (Germany, F.R.). 1987. (In German). In *Festive colloquium to celebrate the 70th anniversary of Prof. em. o. Dr.-Ing. Friedrich Adler. Berlin, October 17, 1986.* Order Number DE90718167. Available from NTIS (US Sales Only), PC A06/MF A01.

The author gives an insight into the problems in the planning and exploration of black-coal deposits with which international mining consultants are faced in their daily work in developing and threshold countries. He discusses the importance of coal for developing countries, the exploration, opening-up and lay-out of coal deposits, technologies matched to specific conditions, profitability, project management and training required for local staff. (MOS).

2082 (ETDE-mf–0718167, pp. 67-92) **Special problems in the exploration and operation of loose-rock open-pit mines in developing and threshold countries.** Gallisch, J.H. (Rheinbraun-Consulting GmbH, Koeln (Germany, F.R.). Abt. Projektwesen). Technische Univ. Berlin (Germany, F.R.). 1987. (In German). In *Festive colloquium to celebrate the 70th anniversary of Prof. em. o. Dr.-Ing. Friedrich Adler. Berlin, October 17, 1986.* Order Number DE90718167. Available from NTIS (US Sales Only), PC A06/MF A01.

The world-wide activities of RHEINBRAUN-Consulting, a RHEINBRAUN AG subsidiary, in the field of open-pit mining technology is reported briefly. As a consulting company, it is concerned with the exploration and assessment of deposits, opening-up feasibility studies, the process of opening-up proper, the installation of required operational infrastructure, the structuring of operation in line-type management, subsequent in-service consulting, handover to operator/project organizer. The author reports experience gained in Asia, Latin America and Southern Europe. Special reference is made to the introduction continuous mining and conveying technology, to technology transfer and mastering of the 'new' technology by the operator/project organizer complete with the necessary planning implications. (MOS).

2083 (DOE/PC/88939–5) **Methane drainage from gassy Western US coal seams.** Hucka, V.J.; Bodily, D.M. Utah Univ., Salt Lake City, UT (USA). Dept. of Mining Engineering. 1989. 8p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88939. (CONF-891018–1: MMIJ/IMM joint symposium on today's technology for the mining and metallurgical industries, Kyoto (Japan), 2-4 Oct 1989). Order Number DE90002801. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Methane gas retained in gassy coal seams is a valuable source of clean energy. However, methane is also a potential safety hazard. Its removal prior to mining improves mine safety by reducing the potential for explosions as well as economics by decreasing ventilation costs. A method of field evaluation of methane content in some Western US coal seams is presented. Results of pre-mining degasification in seams of similar methane content are described. The results indicate that degasification, or methane drainage, depends heavily on coal permeability. Since the permeability is affected by the presence of joints, fractures and cleats in coal and associated strata, their influence on the optimum direction of boreholes was studied. The results of methane drainage are discussed and recommendations as to the orientation of boreholes with respect to the main cleat systems in coal are suggested. 18 refs., 8 figs., 2 tabs.

2084 (DOE/PC/88947–T4) **Development and utilization of new diagnostics for dense-phase pneumatic transport: Quarterly technical progress report, July 1, 1989–September 30, 1989.** Louge, M.Y.; Jenkins, J.T. Cornell Univ., Ithaca, NY (USA). 1989. 22p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88947. Order Number DE90003370. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Dense-phase pneumatic transport is an attractive means of conveying solids. Unfortunately, because of the high solid concentrations, this transport method is a difficult regime in which to carry out detailed measurements. Hence most details of the flow are unknown. In this context, the main objective of this work is to develop probes for local measurements of solid velocity and holdup in dense gas-solid flows. In particular, capacitance probes are designed to measure local, time-dependent particle concentrations. In addition, a new optical fiber probe based on laser-induced-phosphorescence is developed to measure particle velocities. 2 refs., 10 figs.

2085 (ETDE-mf–0718167) **Festive colloquium to celebrate the 70th anniversary of Prof. em. o. Dr.-Ing. Friedrich Adler. Berlin, October 17, 1986.** TUB-Dokumentation Kongresse und Tagungen. Technische Univ. Berlin (Germany, F.R.). 1987. 120p. (In German). Order Number DE90718167. Available from NTIS (US Sales Only), PC A06/MF A01.

A festive colloquium was held at the TU Berlin to celebrate the 70th anniversary of Prof. em. o. Dr. Ing. Friedrich Adler. The subjects of the papers were: Technical and economic aspects in the exploration of black coal deposits, loose-rock open-pit mining in developing countries, today's situation of the mineral oil industry, and research and teaching at university. Three papers were abstracted for entry into the data base. (MOS).

2086 (ETDE-mf–0718193) **VG annual report 1988. Activity report of the Versuchsgrubengesellschaft mbH, Versuchsgrube Tremonia in Dortmund.** Versuchsgrubengesellschaft m.b.H., Dortmund (Germany, F.R.). Versuchsgrube Tremonia. 1989. 118p. (In German, English). Order Number DE90718193. Available from NTIS (US Sales Only), PC A06/MF A01.

It is reported on the investigations and tests carried out in 1988, concerning: Explosions, blasting, mine fires, winding, mechanical engineering, measuring and data processing. (HS).

2087 (OPTIMITURVE–2) **Development of a moisture meter for milled layer.** Aho, V.J.; Leinonen, A.; Hyvaerinen, T. Valtion Teknillinen Tutkimuskeskus, Jyvaeskylae (Finland). Polttoaine- ja Polttotekniikan Lab. 1989. 23p. (In Finnish). Order Number DE90719330. Available from NTIS (US Sales Only), PC A03/MF A01.

OPTIMITURVE Research Program.

The purpose of the present paperis to report the development of a continuously operating moisture meter for milled peat layer. The moisture meter is based on the NIR (Near Infra-red) reflection measuring technique. The meter's detector consists of a Near Infra-red radiation detector, elements for optical measuring, a two-channel Infra-red detector, and an electronic signal processor. This moisture meter system also contains a field operable microcomputer for storing measurement data and a printer for taking print-outs during the measurements. The detector and its accessories are installed onto a carriage which can be pulled along on a bog. The results from various measuring tests, and the differences between these results and the results obtained from measuring samples taken by hand are reported. In addition, the paper describes experiences received from using the homogenization equipment. An lastly, plans for further development of the continuously operating and field operable moisture meter for milled layer are outlined.

2088 (OPTIMITURVE–3) **Calculation of peat production expenses.** Hillebrand, K.; Ahonen, M. Valtion Teknillinen Tutkimuskeskus, Jyvaeskylae (Finland). Polttoaine- ja Polttotekniikan Lab. 1989. 24p. (In Finnish). Order Number DE90719329. Available from NTIS (US Sales Only), PC A03/MF A01.

OPTIMITURVE Research Program.

In this publication costs of different milled and sod peat production methods are examined. Five different production methods, Haku, ridging, medhanical harvester, tractor-driven pneumatic harvester, and self-propelled pneumatic harvester methods have been compared in milled peat production, and Haku and harvester methods in sod peat production, respectively. Using the developed spread-sheet software on can readily examine the effects of initial values, e.g. machine working capacity or composition of units, on production costs. The graphs obtained from the program may be used to illustrate the cost differences between different production methods. It is also possible to determine the most potential research subjects, by which the final target of OPTIMITURVE peat research program may be achieved.

2089 (OPTIMITURVE–5) **Development of a mesuring method for the efficiency of milled peat production.** Lindh, T. Valtion Teknillinen Tutkimuskeskus, Jyvaeskylae (Finland). Polttoaine- ja Polttotekniikan Lab. 1989. 15p. (In Finnish). Order Number DE90719331. Available from NTIS (US Sales Only), PC A03/MF A01.

OPTIMITURVE Research Program.

Measuring methods for determination on efficiency on utilization on weather conditions on peat production are studied in this publication. In the future the aim will be in developing of the measuring method so that the effects of the OPTIMITURVE research program on changes of productivity can be evaluated. Two mehtods were examined in this research. The proposed object for development is a model based on a Soviet estimation method for the annual changes of the seasonal yields. The proposed method is based on studying a long period data from weather and seasonal yields. Differences between different summers and a duration of the rain and its intensivity are considered in the method. Descriptions of the methods including examples and facts effecting on the accuracy of the methods and needs for development are presented in the report.

2090 (OPTIMITURVE–6) **Development of the method for measuring the thickness of a milled peat layer.** Lind, T.; Aho V.J. Valtion Teknillinen Tutkimuskeskus, Jyvaeskylae (Finland). Polttoaine- ja Polttotekniikan Lab. 1989. 47p. (In Finnish). Order Number DE90719332. Available from NTIS (US Sales Only), PC A03.

OPTIMITURVE Research Program.

Measuring methods for continuous measuring of the thickness of a milled peat layer have been studied in this report. The aim was to find a measuring method for research use and to study different possibilities of how does the measuring device work in peat production. Ultra-sound technique was chosen for research and development work. Results of tests using a laboratory device are presented in the report. Parameters effecting on the measuring accuracy and the repetitivity of measurements were tested by using the device. In addition to this the effects of the inclination of the sensors and moisture content of milled peat on the measuring accuracy were tested. Also facts for additional tests and possibilities to develope the method for a field test equipment are presented.

2091 (PB–89-223853/XAB) **Use of foaming mud cement to terminate underground coal fires and to control subsidence of burn cavities. Final report.** Lucero, R.F. Colloidal Contrete Corp., Golden, CO (USA). 29 Sep 1988. 149p. Available from NTIS, PC A07/MF A01.

Foaming Mud Cement (FMC) is a class of materials related to cellular cement studied and developed for the purpose of addressing Abandoned Mine Land problems. During the 2-year program, significant advances were made using a specific methodology that properly employed will enable the successful termination of many surface and underground coal mine fires. Fundamental but key developments attained were: the ability to effectively isolate burning coal from the available air by effectively penetrating burning coal rubble with heat-resistive FMC and encapsulating and isolation of a wide range of coal particle sizes, resulting in permanent coal-fire termination by air exclusion. The materials developed were specifically designed to terminate underground coal fires and preventing further subsidence.

2092 (ANL/PPRNT–89-193) **On the topic of single and multicomponent chemisorption isotherms.** Hajduk, J.C. Argonne National Lab., IL (USA). [1989]. 10p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. Order Number DE90003009. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The following presents the mathematical analysis leading to a general hypergeometric chemisorption isotherm. The correspondence between the limiting cases of this expression and others in the literature is noted. Representative molecular parameters for the interaction of alkali species with a hypothetical cation oxide surface are also given. 8 refs., 1 tab.

2093 (CONF-890437–13) **Metal wastage analysis of carbon steel tubes in FBC environment.** Sethi, V.K.; Puentes, E.; Natesan, K. Argonne National Lab., IL (USA). Nov 1988. 16p. Sponsored by U.S. DOE Fossil Energy; Tennessee Valley Authority. DOE Contract W-31109-ENG-38. From Corrosion '89; New Orleans, LA (USA); 17-21 Apr 1989. Order Number DE90002256. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The TVA 20-MW AFBC Pilot Plant located near Paducah, Kentucky began operations in March 1982, and it operated with the same in-bed evaporator tubes (tube bundle B1) for ~13,625 h through the end of 1985. During January–February 1986, the evaporator tubes were removed to test a new tube bundle configuration (tube bundle C1). After only a short period of operation, tube diameter measurements showed that tube wastage rates for bundle C1 were almost an order of magnitude larger than those recorded for B1. Although several other changes could have been responsible for this increase, the consensus at the TVA was that the increase probably occurred because the pilot plant switched coals from a low chlorine (0.02%) to a high chlorine (~0.30%) KY #9 coal. In order to determine the validity of the role of chlorine in increasing the tube wastage, several tube sections were cut out from the plant and analyzed at the Kentucky Energy Cabinet Laboratory (KECL) and at Argonne National Laboratory (ANL). The results of the chemical and metallographic examination showed that wastage could be attributed to erosive wear of chlorine-impregnated iron oxide scales. Corrosion component (oxidation) could have been altered by the

presence of elements such as chlorine, sulfur, and potassium in the combustion gases. The results also showed that, in order to understand the complex deposition/corrosion phenomena that occur in FBC systems, it is imperative to characterize the local environment in the vicinity of the tube bundles. 5 refs., 16 figs.

2094 (CONF-8906246–1) **Is there a strange attractor in a fluidized bed?.** Tam, S.W.; Devine, M.K. Argonne National Lab., IL (USA). [1989]. 5p. Sponsored by U.S. DOE Fossil Energy; Electric Power Research Institute. DOE Contract W-31109-ENG-38. From Quantitative characterization of dynamical complexity in nonlinear systems workshop; Bryn Mawr, PA (USA); 22-24 Jun 1989. Order Number DE90002206. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Fluidized beds have long been used as multiphase reactors in the chemical processing industries and as fossil-fuel combustion beds in the energy production industries. Depending on the extent to which the fluid flow velocity V exceeds U_{mf}, the fluidized bed can be in different flow regimes. In the regimes of interest (including the so-called bubbling, slugging and turbulent regimes), the fluidized-bed flow parameters tend to fluctuate in time. The flow parameters include particle velocities, pressure, and porosities. The presence of porosities (or voidage) to different extents is a common characteristic of these flow regimes. We have employed a combination of nonlinear dynamical techniques on a relatively large data set for fluidized bed pressure fluctuation. 9 refs., 4 figs.

2095 (DOE/MC/25151–2745) **Test plan for valveless ash removal from pressurized fluid bed combustion systems.** Hauserman, W.B. North Dakota Univ., Grand Forks, ND (USA). Energy and Mineral Research Center. Jul 1989. 26p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-89MC25151. Order Number DE90000401. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This is a test plan to demonstrate a method of ash removal from pressurized fluid bed combustion (PFBC) systems through small beds of crushed rock rather than conventional pressure let-down valves and lock hoppers. The economic advantage of such a method is that process-inherent erosive damage will be inflicted upon the cheaply replaceable crushed rock, rather than upon expensive, fabricated valve trim components. The concept to be tested is an extension of the "gravel bucket" principle in which an erosive, high pressure slurry stream passes through a bed of crushed rock with an adjustable flow path and cross-section. The original gravel bucket concept was inspired by the costly valve erosion problems projected for coal liquefaction plants. This project extends the same approach to systems where solids are to be removed from PFBC systems, with more limited possibilities of application to some coal gasification processes. If proven successful, a hot-gas gravel bucket could offer an economic alternative to a lock hopper plus a pair of expensive block valves. 6 refs., 10 figs., 1 tab.

2096 (DOE/PC/79902–T1) **In-situ measurements of coal ash deposit optical properties: Final report, September 11, 1987–September 30, 1989.** Clark, G.A.; Holmes, M.J.; Vecci, S.J.; Bailey, R.T. Babcock and Wilcox Co., Alliance, OH (USA). Research and Development Div. Aug 1989. 111p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79902. Order Number DE90000641. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

A 6 million-Btu/hr pilot-scale combustor was operated to produce coal ash deposits from Kentucky No. 9 and Illinois No. 6 coals. Three types of deposits were formed: initial powdery, sintered, and fused. By means of an optical probe designed as part of this contact, infrared radiation from powdery and sintered deposits was measured in-situ as a function of wavelength. This data and temperature data were used to determine deposit spectral emittances. Samples of ash deposit were also removed from the slagging panel for laboratory measurement of their emissivities. Both coals produced deposits with total emittances typically between 0.5 and 0.9. The emittances of the powdery deposits were in the lower portion of the range. The emittances of the fused deposits were in the high end of the range. The sintered deposit emissivity was mid range. The emittances measured in the laboratory were consistent with those measured in situ. This project developed a means of making in-situ measurements of the emittances of ash deposits formed in pulverized-coal-fired combustors. 7 refs., 20 figs., 9 tabs.

2097 (DOE/PC/79906–T2) **Laser diagnostics of mineral matter and combustion processes in coal: Research report, September 1, 1988–January 31, 1989.** Venkateswarlu, P.; George, M.C.; Sekhar, P.C.; Subbarao, V. Alabama A and M Univ., Normal, AL (USA). 1989. 8p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79906. Order Number DE90002870. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This is the third report on this project. During the period covered by the first two reports (October 1, 1987 through August 30, 1988) a sample of low sulfur powdered coal was heated under vacuum from 25 to 1000°C at a heating rate of 5°C per minute. The vapors generated were analyzed by a Balzer Quadrupole Mass Spectrometer model QMG 511. The analysis showed that the major constituents of the vapors are aliphatic hydrocarbons. A second set of experiments were carried out to determine the mineral constituents in ash obtained by heating coal in a porcelain crucible at 400–500°C in a muffle furnace until all the coal was oxidized. Model 3030 Perkin Elmer Atomic Absorption Spectrophotometer was used with appropriate hollow cathode lamps. A dozen elements were identified. Al, Na, K and Fe were the most prominent. During this period we have made an extensive series of measurements on laser induced combustion of coal pellets made from coal powder. C_2, CN, CO, Na and K were identified from the spectra. We have also fabricated a burner for the study of coal combustion using laser spectroscopic techniques. 1 ref., 4 figs.

2098 (DOE/PC/88900–5) **An engineering model for coal devolatilization: Quarterly report, March 15, 1989–June 15, 1989.** Lau, Chun Wei; Niksa, S. Stanford Univ., CA (USA). High Temperature Gasdynamics Lab. Sep 1989. 31p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88900. Order Number DE90003043. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

There are three distinct modeling projects in this program: (1) an expedient reaction model for coal devolatilization for large scale combustor simulators; (2) a theoretical framework to explain the behavior of different coal types; and (3) an analysis of the chemistry, heat and mass transport in the vicinity of individual coal particles, to begin to describe the initial stages of the combustion of entrained coal particles. In the third activity, the transport analyses of devolatilizing and oxidizing coal particles, a two-component model which resolves tar and noncondensibles was formulated this quarter, and implemented in a computer simulator; this model is called the AEM3. The flux of tar and noncondensibles is now described with FLASHTWO, our engineering kinetics model. The AEM3 resolves tar and noncondensibles and illustrates the disparate growth rates of their concentration profiles. The AEM3 simulations also convey interesting implications for ignition mechanisms. Most importantly, resolving the tar and noncondensibles seems to considerable clarify homogeneous ignition mechanisms. 4 refs., 7 figs., 2 tabs.

2099 (ECN–220) **Review on mineral matter transformations and slagging in pulverized coal combustion.** Ten Brink, H.M. Netherlands Energy Research Foundation, Petten (Netherlands). Apr 1989. 73p. (MMT–0). Order Number DE90722329.

A survey is presented of the transformations that the mineral matter in coal undergoes during combustion. In chapter 1 the pheno enon of slagging is introduced and a short outline is given of the fate of the mineral matter during pulverized coal combustion. Also the major references, which are used for the report, are categorized and critically commented upon. A description of the general fate of the mineral matter in the coal combustion process is presented in chapter 2. In chapter 3 the transformation that the minerals undergo in a standard furnace are described. In chapter 4 a review is given of the present-day knowledge on slag deposit formation. Chapter 5 presents conclusions, critical comments and suggestions for improvement of the knowledge on slagging. 15 figs., 24 refs., 8 tabs., 1 app.

2100 (ECN–222) **Mineral matter transformations and slagging in a semi-industrial furnace.** Ten Brink, H.M.; Hamburg, G.;

Vleeskens, J.M.; Smart, J.P.; Dugue, J. Netherlands Energy Research Foundation, Petten (Netherlands). Aug 1989. 95p. (MMT–1). Order Number DE90722330.

A three-day slagging trial, which has been performed in the 2.5 MW semi-industrial sized IFRF (International Flame Research Foundation) Furnace No. 1, is described. In this trial the build-up of ash deposits on deposit probes has been followed while simultaneously the transformations of the coal-ash minerals in the furnace were monitored. The objective of this trial was to relate the nature of the deposits to the changes in the minerals prior to deposition. In this way the mechanism of deposit formation should be further clarified. However, the trial was performed on a scale that the results would also reveal which of the furnace parameters are central in deposit formation in full-sized furnaces. It was thus anticipated that the trial would also provide information on an empirical level to be used in the improvement of design and operation of full-sized boilers with respect to slagging. The slagging trial (MMT-1) formed part of the mineral matter transformation (MMT) project within the IEA-CCS program, Annex 2. The basis of the MMT project is the identification by the IEA Coal Industry Advisory Board of in-furnace deposition of ash (better known as slagging) as a major problem area in pulverized coal firing. 34 figs., 20 refs., 4 tabs., 3 apps.

2101 (STEV-FBT–89-27) **Heat transfer in circulating fluidized bed boilers.** Johnsson, F.; Andersson, B.Aa.; Leckner, B. Statens Energiverk, Stockholm (Sweden). 1989. 12p. (CONF-8805338–: Minsk international heat and mass transfer forum, Minsk (USSR), May 1988). Order Number DE90719437. Available from NTIS (US Sales Only), PC A03/MF A01.

The aim of the work is to measure the heat transfer to the walls of the combustion chamber of a CFBB and to analyze the results by means of a mathematical model. Furthermore, a comparison is made with available heat transfer data found in the literature. 16 refs., 2 tabs.

2102 (DOE/FE–0141) **The directory of US coal and technology export resources.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Office of Planning and Environment. Oct 1989. 265p. Sponsored by U.S. DOE Fossil Energy. Order Number DE90001792. Available from NTIS, PC A12/MF A01 - OSTI; GPO Dep.

The purpose of this directory is to provide a listing of available US coal and coal related resources to potential purchasers of those resources abroad. The directory lists business entities within the United States which offer coal related resources, products and services for sale on the international market. Each listing is intended to describe the particular business niche or range of product and/or services offered by a particular company. The listing provides addresses, telephones, and tele/fax for key staff in each company committed to the facilitation of international trade. The content of each listing has been formulated especially for this directory and reflects data current as of the date of this edition.

2103 (ETDE-mf–0722093) **Shaping of working conditions for handicapped persons according to results of human-engineering research in hardcoal mining - main phase. Final report.** Hesse, D.; Bluemke, D.; Tulowitzki, H. Ruhrkohle A.G., Essen (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Oct 1986. 73p. (In German). BMFT 01 VS 242 A/1. Order Number DE90722093. Available from NTIS (US Sales Only), PC A04/MF A01.

The problem how to employ severely handicapped persons gains increasing importance for mining. The reason therefore is partially found in the unfavourable age structure of the staff of this industry and the fact that the impact of handicaps increases with advancing age of staff so that the persons concerned can no longer meet the requirements of their job. The project aims at development and testing of a practice-orientated concept to integrate handicapped (by occupational decease, accident at work, or illness) into the personnel deployment in a way that capacities and job requirement are matched. Within the project, model jobs are to be developed and guidelines are to be drafted containing the criteria of working conditions according to human-engineering principles. The corresponding conditions are to be created for new jobs as well as for existing jobs which need to be modified. In addition, questions of training and continued formation of handicapped staff will be considered. (orig.).

2104 (ETDE-mf–0722301) **Investigation of explosion with delayed start ($\geq$ 150 m) and methods of prevention. Final report.** Michelis, J. Versuchsgrubengesellschaft m.b.H., Dortmund (Germany, F.R.); Commission of the European Communities, Brussels (Belgium). Directorate for Social Affairs. 30 Jun 1987. 114p. (In German). Order Number DE90722301. Available from NTIS (US Sales Only), PC A06/MF A01.

In the course of this research programme, more than 100 large-scale explosion experiments were carried out in the explosion-proof test gallery R3 of Tremonia test mine, which is equipped with all the necessary measuring facilities. The experiments were either carried out without any explosion protection measures, or with water tank explosion protection systems. With water tank protection, the flame range could be reduced by more than a factor of 2 as compared with the unprotected experiments. The experimental procedure and results are described in detail. (MOS).

2105 (LBL–27846) **WES, a robust expert system for well test analysis.** Mensch, A.; Benson, S.M. Lawrence Berkeley Lab., CA (USA). Sep 1989. 25p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC03-76SF00098. (CONF-8812107–1: Fall meeting of the American Geophysical Union, San Francisco, CA (USA), 4 Dec 1988 - 8 dec 1989). Order Number DE90003273. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Well tests are generally performed to determine the hydrologic properties of aquifers, petroleum reservoirs and underground waste disposal sites. There are many types of well tests, however, for the purposes of this paper, we consider two of the most common: pressure draw-down tests (production of a well at a constant flow rate) and pressure build-up tests (shut-in of a well after a production period). For both of these tests, the pressure changes in the wellbore are monitored for the duration of the test. The resulting data set consists of pressure versus time values, along with the corresponding flow rate data. WES is an expert system developed for well test analysis which combines data processing and graphic representations with the expertise that can be provided by an expert system. The new possibilities offered by an expert system in the field of automatic well test analysis are discussed. 22 refs., 11 figs., 3 tabs.

2106 (OCS/MMS–89-0058) **Federal offshore statistics, 1987: Leasing exploration, production, and revenues.** Harris, W.M.; Thurston, L. (comps.). Minerals Management Service, Herndon, VA (USA). [1989]. 97p. Sponsored by U.S. Department of the Interior. Available from OSTI - US Dept. of Interior, Office of Offshore Information and Publications, Minerals Management Service, Mail Stop 642, 381 Elden Street, Herndon, VA 22070.

This sixth edition of the Federal Offshore Statistics reports the mineral leasing, exploration, and production activities on the submerged lands and seabeds of the Nation's Outer Continental Shelf (OCS), as of December 31, 1987. This edition also includes selected State offshore statistics provided by the coastal States.

2107 (BNL–43128) **Interaction between thermophilic microorganisms and crude oils: Recent developments.** Premuzic, E.T.; Lin, Mow S. Brookhaven National Lab., Upton, NY (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-890884–2: Bioprocessing of fossil fuels workshop, Arlington, VA (USA), 8-11 Aug 1989). Order Number DE90003262. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A considerable research effort in the area of microbially enhanced oil recovery (MEOR) has shown that it is promising, and that a recovery biotechnology may be developed. Successful biochemical processes would have to be cost effective and have certain properties, such as being able to produce emulsifying agents and acidify the media. Further, the microbes producing these conditions should also be tolerant of high salt concentrations and be capable of metabolizing high molecular weight compounds. Since oil reservoirs are also subject to temperature and pressure variations, successful microbial strains should also be able to adapt to such environments. Thermophilic microorganisms, which usually live in harsh environments, appear to be good candidates for MEOR. Continuing work in this laboratory dealing with the chemistry and biochemistry of microorganisms living under extreme conditions has been expanded to a systematic study of the interaction of thermophilic microorganisms with crude oils and oil derivatives. Some recent results of these studies are presented. 15 refs., 5 figs., 1 tab.

2108 (CONF-8811286–Absts.) **Crude oil emulsions. Abstracts.** Institut fuer Erdoelforschung, Clausthal-Zellerfeld (Germany, F.R.). 1988. 11p. (In German). From IFE colloquium on crude oil emulsions; Clausthal-Zellerfeld (Germany, F.R.); 25 Nov 1988. Order Number DE90721817. Available from NTIS (US Sales Only), PC A03/MF A01.

On the occasion of this colloquium six lectures were held on the above-mentioned topic. These lectures dealt with composition, structure and transport behaviour of oil/water and water/oil emulsions, especially with the influence and effect of demulsifiers. (RB).

2109 (DOE/SF/00098–T14) **The influence of texture on steady foam flow in Berea sandstone.** Ettinger, R.A.; Radke, C.J. California Univ., Berkeley, CA (USA). Dept. of Chemical Engineering. Oct 1989. 31p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC03-76SF00098. Order Number DE89000771. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have studied the quantitative role of bubble size in the steady flow of strong foam through a 0.8-μm^2 Berea sandstone. Inlet and outlet textures are determined from photomicrographs taken of bubbles flowing through specially designed visual cells. Concurrent measurements of pressure profiles and liquid saturation profiles by microwave attenuation are acquired for gas velocities ranging from 1 to 3 m/day and covering a foam quality range from 70 to 90%. At steady state, liquid saturations remain constant near 35% independent of gas velocity. Moreover, measured foam-flow resistances practically do not vary with gas velocity over the studies range. Foam textures, however, do vary dramatically. For example, injected fine bubbles near 80 μm in diameter exit the sandstone with sizes around 300 μm. Powerful coalescence forces are the origin of this coarsening. Effluent bubble sizes increase slightly with increasing gas velocity, but are independent of the injected size. A simple one-dimensional foam population-balance model is outlined to quantify the observed flow and texture behavior. At steady state, generation and coalescence mechanisms alter the foam texture over distances of less than about a centimeter. 31 refs., 12 figs., 1 tab.

2110 (ETDE-mf–0718080) **Analysis, development and investigations into phase behaviour of surfactant systems for de-oiling high-salinitiy reservoirs with reference to the Bockstedt field of Wintershall AG. Final report.** Krusche, G.; Greif, N.; Lessner, E. BASF A.G., Ludwigshafen am Rhein (Germany, F.R.); Wintershall A.G. Erdoelwerke, Barnstorf (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Jan 1988. 89p. (In German). BMFT 03E6123 B/C/9. Order Number DE90718080. Available from NTIS (US Sales Only), PC A05/MF A01.

To achieve close cooperation between surfactant analysis, surfactant synthesis and phase investigations, R and D-projects 03E-6123 B and 03E-6123 C were run as team projects by BASF and Wintershall. The development of new analytical methods enabled non-ionic and ionic surfactants in oil/water matrices to be quantitatively determined. Further, the manufacture of the surfactants, including byproducts, was analytically monitored. The task of sufactant synthesis was to optimize the individual reaction stages and to minimize the occurrence of byproducts. Where neccessary, surfactant structures were varied and commercially unavailable surfactants made accessible. The phase behaviour of non-ionic and ionic surfactants was substantially clarified with the aid of systematic phase investigations on ternary water/oil/surfactant systems. A number of suitable surfactant combinations was developed for the reservoir conditions in the Bockstedt field. (orig.) With 1 tab., 57 figs.

2111 (LBL–27729) **The influence of texture on steady foam flow in Berea sandstone.** Ettinger, R.A.; Radke, C.J. Lawrence Berkeley Lab., CA (USA). Jun 1989. 50p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC03-76SF00098. (CONF-891049–3: Society of Petroleum Engineers annual technical conference and exhibition, San Antonio, TX (USA), 8-11 Oct 1989). Order Number DE90003112. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An understanding of texture, or bubble-size, evolution is paramount for modeling foam flow in porous media in that fine textures may impart large flow resistances. Bubble size, in turn, is determined by complicated lamellae creation and decay processes. We study, for the first time, the quantitative role of bubble size in the steady flow of strong foam through a 0.8-μm^2 Berea sandstone. Inlet and outlet textures are determined from photomicrographs taken of bubbles flowing through specially designed visual cells. Concurrent measurements of pressure profiles and liquid saturation profiles by microwave attenuation are acquired for gas velocities ranging from 1 to 3 m/day and covering a foam quality range from 70 to 90%. 31 refs., 12 figs.

2112 (NIPER–417) **Use of amine oxide surfactants for chemical flooding EOR [enhanced oil recovery].** Olsen, D.K. National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA). Nov 1989. 37p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-83FE60149. Order Number DE89000773. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The use of amine oxides with and without alcohols as cosolvents, and in combination with other surfactants as mixed micellar formulations for enhanced oil recovery by surfactant flooding was investigated. Amine oxides are a salt-tolerant class of surfactants that produce low interfacial tension and can develop viscosity without the addition of polymers. These salt-tolerant formulations generate three-phase regions with hydrocarbons over a broad salinity range, develop moderate solubilization, and produce low interfacial tensions, however oil recovery from amine oxide-alcohol phase behavior optimized formulations was directly dependent upon the quantity of surfactant injected. The large pore volume and high concentration of surfactant required prohibits their economic use as the primary surfactant in chemical flooding EOR. Dimethylalkylamine oxides are useful as cosurfactants and viscosifiers in formulations with other surfactants for chemical flooding EOR but the use of ethoxylated and propoxylated amine oxides should be avoided due to the decomposition of these amine oxides under reservoir conditions. Phase behavior, phase inversion temperatures, and viscosity scans have been correlated with surfactant structures to provide a guide for amine oxide applications in chemical flooding. 36 refs., 5 figs., 6 tabs.

2113 (NIPER–438) **Ambient and high-temperature calorimetry of commercial surfactants: Project BE4A, Milestone 8, FY89 annual research plan.** Noll, L.A. National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA). Sep 1989. 53p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract FC22-83FE60149. Order Number DE90002802. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Knowledge of the critical micelle concentration (CMC) is required for the effective use of surfactants for steamflooding, surfactant enhanced oil recovery, and process applications. The CMC's and solution behavior of commercial surfactants as a function of temperature were studied by dilution calorimetry. The surfactants selected were Chevron's Chaser SD1000, a good foamer; Shell's Enordet

AOS 1416, an intermediate foamer; and Diamond-Shamrock's Sellogen WL, a poor foamer. Although Sellogen is not intended to be used as a steam additive, it was included to emphasize differences between good and poor foamers. In addition to these surfactants, two carboxymethylated ethoxylated surfactants were used: Huels' B498 and Sandox's Sandopan MA-18. Finally, a mixture of Enordet and MA-18 was tested as an example of mixed surfactant types. 9 refs., 12 figs., 36 tabs.

2114 (NIPER–443) **Selection of an effective biocide and toxicity evaluation for a specific MEOR [microbial enhanced oil recovery] microbial formulation.** Chase, K.L.; Bryant, R.S.; Bertus, K.M.; Stepp, A.K. National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA). Sep 1989. 18p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-83FE60149. Order Number DE90002573. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The two major environmental impacts associated with microbial enhanced oil recovery (MEOR) are possible contamination of surface and groundwater and contamination of agricultural land. Other potential environmental problems associated with MEOR processes include changes in indigenous microflora in reservoirs caused by injection of nonindigenous microorganisms and nutrient, or the possibility of injected microorganisms mutating and producing undesirable compounds under reservoir conditions. A specific MEOR microbial formulation, NIPER 1 and 6, was first tested for pathogenicity and mutagenicity of its metabolic products. Pathogenicity testing included both oral ingestion and intraperitoneal injection of the NIPER 1 and 6 formulation using mice. The Ames test was used to determine any mutagenic tendencies of filtered NIPER 1 and 6 metabolic products. Although the MEOR formulation tested negative for both pathogenicity and mutagenicity, biocide tests were conducted to select an effective biocide in the event of a spill or environmental hazard when using this formulation in the field. An aqueous solution of 370 ppM formaldehyde was the most effective biocide for eradicating the microbial formulation. For reservoir injection, sodium hypochlorite at an aqueous concentration of 5000 ppM appears to control growth of the microbial formulation and is less hazardous to the environment. 13 refs., 4 figs., 6 tabs.

2115 **Predicting horizontal/slanted well production by mathematical modeling.** Chang, M.M. (National Institute for Petroleum and Energy Research (US)); Tomutsa, L.; Tham, M.K. vp of SPE joint Rocky Mountain regional/low permeability reservoirs symposium and exhibition. Society of Petroleum Engineers, Richardson, TX (1988). (CONF-890354–: SPE joint Rocky Mountain regional meeting and low permeability reservoir symposium, Denver, CO (USA), 6-8 Mar 1989).

Technical Paper SPE 18854.

This paper presents a horizontal and slanted well model developed and incorporated into BOAST, a black oil simulator, to predict the potential production rates for such wells. The slanted/horizontal well model can be used to calculate the productivity index, based on the length and location of the wellbore within the block, for each reservoir grid block penetrated by the slanted/horizontal wellbore. Production rates from vertical wells, horizontal wells, and slanted wells of variable well lengths in a field of 40-acre well spacing are compared.

2116 **A correlation for interference testing with wellbore-storage and skin effects.** Ogbe, D.O. (Alaska Univ., Fairbanks, AK (USA)); Brigham, W.E. *SPE (Society of Petroleum Engineers) Formation Evaluation (USA),* 4(3): 391-396 (Sep 1989).

In this paper a new correlation and set of pressure-response and pressure-derivative type curves are presented for interference test analysis. The influence of wellbore storage and skin effects at active and observation wells on interference pressure response is examined. In the case of wellbore storage and skin in one well, the correlating parameter $[C_De^{2s}]C_D/r_D^2$ is used to combine wellbore storage and skin variables in a way that makes it possible to display, on a single type curve, all interference test data that would ordinarily require a number of type curves for various combinations of C_D/r^2_D and C_De^{2s}. The product of the correlating parameter is used when wellbore storage and skin effects are active at both wells. The difference in the shapes of the single-well storage type curves compared to the two-well storage case at early times can be used as a diagnostic features in interference testing.

2117 **Altered-stress fracturing.** Warpinski, N.R. (Sandia National Labs., Albuquerque, NM (USA)); Branagan, P.T. *Journal of Petroleum Technology (USA),* 41(9): 990-996 (Sep 1989). DOE Contract AC04-76DP00789.

This paper describes altered-stress fracturing, a concept whereby a hydraulic fracture in one well is reoriented by another hydraulic fracture in a nearby location. A field test was conducted in which stress changes of 250 to 300 psi [1.7 to 2.1 MPa] were measured in an offset well 120 ft [37 m] alway during relatively small minifractures in a production well. Results show that altered-stress fracturing is possible at this site and others.

2118 (DOE/CH/10093–57) **Membrane separation processes for liquid hydrocarbons and gases in the petrochemical industry: A technical case study.** Solar Energy Research Inst., Golden, CO (USA); Energetics, Inc., Columbia, MD (USA). Sep 1989. 13p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093;AC01-87CE40762. Order Number DE89009464. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

OIP and Allied Signal Corporation have completed a joint project exploring new applications of membrane separation technology for the petrochemical and related industries. These applications have the potential for major energy savings compared to more traditional distillation and chemical absorption processes. This technical case study provides an overview of the DOE-Allied Signal membrane development project. It highlights the field testing of modified cellulose acetate membrane systems for acid gas removal at two commercial natural gas plants. The document is aimed at making field test and data analysis results available to other researchers and private industry in a timely manner. This case study discusses project status; summarizes field testing efforts; and reviews potential technology impacts in terms of applications, energy savings, and preliminary economics.

2119 (AD-A–210188/9/XAB) **Properties of F-34 (JP-8) fuel for 1988. Summary report, January-December 1988.** Martel, C.R. Wright Research and Development Center, Wright-Patterson AFB, OH (USA). Apr 1989. 27p. (WRDC-TR–89-2021). Available from NTIS, PC A03/MF A01.

This report summarizes the properties of 95 F-34 fuels delivered to U.S. military installations during calendar year 1988. Most of the fuel was obtained from refineries in Germany, Spain, Sicily and Greece, with one shipment obtained from Bahrain and seven shipments from Venezuela. F-34 destinations included the Central European Pipeline (via terminals in Germany and France), the United Kingdom Pipeline, the Azores, Spain, Italy, Korea and the United States. All of the F-34 fuels met Specification MIL-T-83133B requirements except for Particulate Matter (5 of the 95 fuels slightly exceeded the limit). Most fuel properties were well within specification limits. Two controversial specification limits are the 0.002 wt % limit on mercaptan sulfur (commercial jet fuel specifications allow up to 0.003 wt %) and the filtration-time limit. None of the fuels exceeded 0.001 weight percent mercaptan sulfur. Also, all fuels met the filtration time limit, although several fuels were at the specification limit of 15 minutes.

2120 (AD-A–210195/4/XAB) **High-energy-density solid and liquid hydrocarbon fuels. Final report, July 1987-December 1988.** Marchand, A.P. Geo-Centers, Inc., Newton Upper Falls, MA (USA). Feb 1989. 37p. Available from NTIS, PC A03/MF A01.

The development of new high-energy hydrocarbon fuels for use in air-breathing missiles has been the objective of a number of investigations which have received support during the past decade through programs sponsored by the Air Force Systems Command

and/or the Naval Air Systems Command. The key characteristics which must be met by potential cruise missile fuels have been described by Burdette and coworkers. A primary requirement in this regard is that candidate fuels must possess high net volumetric heat of combustion (preferably greater than 160,000 BTU/gallon). In order to meet the primary requirement of high net volumetric heat of combustion, hydrocarbon systems have been sought which maximize the ratio of carbon-atom to hydrogen-atom content have been sought that maximize the ratio n/m.(JES)

2121 (AD-A–210547/6/XAB) **Wide-range fuel flowmeter. Phase 2. Final report, 4 June 1986-3 February 1988.** Seiler, W. Waugh Controls Corp., Chatsworth, CA (USA). Jul 1989. 120p. Available from NTIS, PC A06/MF A01.

The Wide-Range Fuel Flowmeter (WRFF) development program proved the viability of the recirculation method of wide-range flow measurement over a 140 to 1 or greater range with a 1% or better measurement uncertainty. The objectives were to: (1) Reduce the size of the flowmeter and electronic conditioner and provide a more functional and economically producible system; (2) Replace the recirculating pump with a smaller, more-reliable unit and assure that all components in contact with the fluid are compatible with jet fuels; (3) Provide means to disable recirculating flow when operating at high flow rates; and (4) Evaluate the performance of an air-driven pump for possible use in hazardous atmospheres. The meter was redesigned to greatly reduce its size and weight; large and expensive manifolds were eliminated, and wherever possible, commercially available fittings were used. Inwardly pointing tubes were incorporated to inject and retrieve the recirculating flow, reducing recirculation flow variation and related recirculation flow errors. The electronic conditioner was repackaged in a standard 3-1/2-by 19-in. rack mount. An auto-zero feature was created and incorporated in the electronic conditioner, greatly simplifying and accelerating the zeroing process. Testing was conducted to verify rangeability, transient response, long-term stability without re-zeroing, meter performance without recirculation, and performance using an air-driven pump.

2122 (AD-A–211055/9/XAB) **US Marine 3rd Tank Battalion lubrication evaluation under hot ambient temperatures at Twenty-Nine Palms, California. Interim report, April-September 1988.** Butler, W.E.; Owens, E.C.; Frame, E.A.; Bowen, T.C. Southwest Research Inst., San Antonio, TX (USA). Belvoir Fuels and Lubricants Research Facility. Sep 1988. 43p. (BFLRF–251). Available from NTIS, PC A03/MF A01.

Military Specification MIL-L-2104D, Lubricating Oil, Internal Combustion Engines, Tactical Service, was released 1 April 1983. This specification included a multiviscosity OE/HDO-15/40 oil and eliminated a previously authorized OE/HDO-50 oil. The manufacturer of the AVDS-1790 series engines used in M60 battle tanks and M88 tank retrievers raised raised concerns about warranty coverage. The U.S. Marine Corps indicated that the use of the authorized 15W-40 grade oil did not offer sufficient lubrication for the engines and also resulted in M60 final drive leaks. As a result of these concerns, the U.S. Army Belvoir Research, Development and Engineering Center (Belvoir RDE Center) authorized an oil comparison test that, by agreement with the U.S. Marine Corps, would be conducted at the U.S. Marine Corps Air-Ground Combat Center (USMCAGCC) at Twenty-Nine Palms, CA using the U.S. Marine 3rd Tank Battalion (3DTKBn). The test vehicles of A Company, 3DTKBn were charged with regular issue 50-grade oil in the engine, 10-grade oil in the transmission, and 50-grade oil in the M60 final drives. B Company's test vehicles were charged with 15W-40 grade oil in the engines, transmissions, and M60 final drives. C Company's test vehicles were charged with 40-grade oil in the engines, 10-grade oil in the transmissions, and 50-grade oil in the final drives. Results from this 4-month test indicated no discernible differences in engine or transmission operating temperatures, engine oil pressures, or M60 final drive leaks.

0206 Health and Safety

2123 (INIS-BR–1718) **Oil wells and gas wells: aspects of radiological safety.** Soares, S.M.V.O. Instituto Brasileiro do Petroleo, Rio de Janeiro, RJ (Brazil). 1987. 12p. (In Portuguese). (CONF-8705395–: 5. Seminar on Industrial Safety, Fortaleza (Brazil), 26-29 May 1987). Order Number DE90608333. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The objective of the present work is to present and analyse the main radiological protection problems associated with non destructive inspections of oil wells, with the view of minimizing the dose to members of the public living in nearby urban zones. Problems related to the surveillance of such activities and the need for well formulated procedures are also discussed based on specific Brasilian regulations. Finally, some examples of radiological accidents that have occured in urban zones are described including the methodology employed for the rescue of Iridium-192 sources and for the estimate of radiation doses for workers and general public. This report contains compiled data on petroleum fuels market activity, price trends, refinery activities, petroleum production, and petroleum company financial statements for the state of California. (CBS)

2125 (DOE/EIA–0380(89/08)) **Petroleum marketing monthly.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. Aug 1989. 201p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002807. Available from NTIS, PC A09/MF A01 - GPO - OSTI; GPO Dep.

The Petroleum Marketing Monthly (PMM) is designed to give information and statistical data about a variety of crude oils and refined petroleum products. The publication provides statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analyst, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the f.o.b. and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Sales data for motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane are presented.

2126 (ETDE-mf–0718167, pp. 93-112) **The present-day situation of the mineral oil industry.** Belka, H.G. (Deilmann (C.) AG, Bentheim (Germany, F.R.). Abt. Strategische Planung). Technische Univ. Berlin (Germany, F.R.). 1987. (In German). In *Festive colloquium to celebrate the 70th anniversary of Prof. em. o. Dr.-Ing. Friedrich Adler. Berlin, October 17, 1986.* Order Number DE90718167. Available from NTIS (US Sales Only), PC A06/MF A01.

Based on the extreme decline of crude oil prices, the author demonstrates the effects of crude-oil price development on the earning situation and on the economic situation of the German oil producing industry. The author also comments on the perspectives for the production of crude oil in Germany in the future. (MOS).

2127 (PB–89-224810/XAB) **Guide to oil waste-management alternatives for used oil, oily waste water, oily sludge, and other wastes resulting from the use of oil products. Final report.** Energy and Environmental Research Corp., Irvine, CA (USA). Apr 1988. 223p. Available from NTIS, PC A10/MF A01.

See also PB–89-224802.

This report presents the results of a study of oil waste-management alternatives. The study includes regulations, established and emerging technologies, current practices, economics, and environmental impacts of oil waste management. The report focuses on methods of improving oil-waste recyclability and phasing out land disposal. The report includes recommendations for industrial oil-waste generators. It is the companion volume to 'Oil Waste Management Alternatives Symposia – Conference Proceedings'.

0209 Environmental Aspects

2128 (PB–89-219430/XAB) **Effects of wind and Gulf Stream events on the currents off the coast of North Carolina as it relates to oil-spill risk potential.** Vukovich, F.M.; Crissman, B.W.; Pietrafesa, L.J.; Janowitz, G.S.; Weisberg, R.H. Minerals Management Service, Herndon, VA (USA). Aug 1984. 70p. Available from NTIS, PC A04/MF A01.

The purpose of this study was to determine the potential effects of wind-induced currents and Gulf Stream events on the current regime off the North Carolina coast.

2129 (PB–89-220701/XAB) **Georges Bank benthic infauna monitoring program. Final report for third year of sampling. Volume 1. Final executive summary.** Battelle New England Marine Research Lab., Duxbury, MA (USA). 30 Apr 1985. 47p. Available from NTIS, PC A03/MF A01.

See also Volume 2, PB–89-220719; Also available in set of 3 reports PC E99, PB–89-220693.

A 10-month study by the Research Institute of the Gulf of Maine was conducted to gather and inventory the existing environmental socio-economic data of the coastal zone and adjacent outer continental shelf from Sandy Hook, New Jersey to Bay of Fundy. These data were based on the requirements for impact assessments prior to leasing offshore areas for oil, gas, and mineral exploration and production. The marine boundaries were Hudson Canyon, the 200 meter contour, and the Canadian international line; shoreward, the limit of salt intrusion was the boundary while some 38 counties were inventoried for socio-economic data. Over 300 persons were contacted or interviewed, 3800 documents reviewed for data by about 40 scientists and consultants. The major topics inventoried and presented in the report are environmental, systems ecology by habitat, unique and endangered environments, environmental quality, and socio-economics.

2130 (PB–89-220719/XAB) **Georges Bank benthic infauna monitoring program. Final report for third year of sampling. Volume 2.** Maciolek-Blake, N.; Grassle, J.F.; Neff, J.M. Battelle New England Marine Research Lab., Duxbury, MA (USA). 15 Apr 1985. 357p. Available from NTIS, PC A16/MF A01.

See also Volume 1, PB–89-220701 and Volume 3, PB–89-220727. Errata sheet inserted; Also available in set of 3 reports PC E99, PB–89-220693.

Concerns about the potential effects of oil- and gas-exploration activities on Georges Bank led to the initiation of a monitoring program in July 1981. The program included sampling of the benthic communities near, upcurrent, and downcurrent of the drilling rigs, analysis of bottom photographs for epifauna and microtopography, trawl collections, total organic carbon and sediment grain size analysis. Additional aspects of the program included a detailed life history analysis of 23 dominant species, and a study which linked fish feeding with benthic production. No biological impacts that could be attributed to drilling activities were detected at any station.

2131 (PB–89-220727/XAB) **Georges Bank benthic infauna monitoring program. Final report for third year of sampling. Volume 3. Appendices.** Maciolek-Blake, N.; Grassle, J.F.; Neff, J.M. Battelle New England Marine Research Lab., Duxbury, MA (USA). 15 Apr 1985. 254p. Available from NTIS, PC A12/MF A01.

2132 (PB–89-222475/XAB) **Removal of oil from oil-water mixtures using selective oil filtration. Masters thesis.** Magdich, P.; Semmens, M. Minnesota Univ., Minneapolis, MN (USA). Dept. of Civil and Mineral Engineering. Jun 1988. 183p. Available from NTIS, PC A09/MF A01.

This project studied the selective oil filtration (sof) process as an alternative method for removing oil from oily waste waters or other oil-containing wastes. The sof is similar to ultrafiltration in that microporous membranes are used. Unlike in ultrafiltration, however, oil rather than water is selectively removed by applying a pressure across the membrane. The results show that the sof process will remove free, mechanically dispersed and chemically emulsified oil from oil-water mixtures. Sof did not work for the removal of oil-wet solids, and, prior to filtration, the suspended solids must be removed to prevent membrane fouling.

2133 (PB–89-871974/XAB) **Oil-spill removal techniques and equipment. January 1973-September 1989 (Citations from Fluidex data base). Report for January 1973-September 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 75p. Available from NTISPC N01/MF N01.

Supersedes PB–86-871589.

This bibliography contains citations concerning equipment and techniques for the control, dispersion, cleanup, and disposal of oil spills. Topics include chemical dispersants, booms, and mechanical skimmers. Harbors, estuaries, shorelines and the resulting impact on water birds and marine life are emphasized. (This updated bibliography contains 171 citations, 20 of which are new entries to the previous edition.)

0220 Transport, Pipelines, and Handling

2134 (AD-A–210909/8/XAB) **Lubricated pipelining: Stability of core-annular flow.** Joseph, D.D. Minnesota Univ., Minneapolis, MN (USA). Dept. of Aerospace Engineering and Mechanics. 1989. 34p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Fluid Mechanics, Vol. 201, 323-356(1989).

There is a strong tendency for two fluids to arrange themselves so that the low-velocity constituent is in the region of high shear. This gives rise to a kind of gift of nature in which the lubricated flows are stable, and it opens up very interesting possibilities for technological applications in which one fluid is used to lubricate another. We can imagine that it may be possible to introduce a beneficial effect in any flow of very viscous liquid important in applications by introducing small amounts of lubricating fluid. Nature's gift is evidently such that the lubricating fluid will migrate to the right places so as to do the desired job. There are significant reserves of heavy viscous crude oils in the United States, Canada, Venezuela, and Europe. Heavy crudes may have viscosities of 1000 P at room temperature. These viscous crudes cannot be transported by the usual pipeline methods. It is customary to reduce the viscosity of the oil either through the addition of a hydrocarbon diluent or through the installation of heating equipment at short intervals along the pipeline.

2135 (STEV–1989-R5) **Petroleum fuels. Development of quality from 1980 and on.** Bergholm, A. Statens Energiverk, Stockholm (Sweden). Feb 1989. 88p. (In Swedish). Order Number DE90719392. Available from NTIS (US Sales Only), PC A05/MF A01.

The development of the fuel market in Europe leads to a decreased share of heavy-oils and an increased share of light products, particularly diesel oil. In any case, avaliable crude oils will not be. There is rather a weak tendency towards heavier crude oils with an increased share of residual oil. Both these tendencies make the refineries pass on to technologies producing a considerably increased yield of lighter products. The easiest way to increase the light products yield is thermal or catalytic cracking. A considerable expansion of the cracking capacity has already taken place and continues. There is a risk for those alterations in the refinery stage to result in a deteriorated fuel quality bringing about negative consequences particularly for the environment. However, available analyses indicates that the Swedish quality changes have been very marginal up to now.(With 10 illustrations, 11 tables and 35 references).

03 NATURAL GAS

The program covers aspects of basic research and education in gas engineering.

0301 Reserves

2138 (DOE/MC/23140–2695) **Multizone completion opportunities in the Appalachian basin: Final report.** Koziar, G. Columbia Gas System Service Corp., Columbus, OH (USA). Mar 1989. 107p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-86MC23140. Order Number DE89000979. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This report identifies areas of favorable Devonian shale gas potential beyond historically productive shale regions of the Appalachian basin in West Virginia. Geologic, reservoir and production data were employed to establish parametric correlations and trends. In particular, formation stress ratio, permeability-thickness product, gas production and modified productivity index terms were used to determine relationships and define Devonian shale gas potential. 9 refs., 47 figs., 4 tabs.

2139 (NEI-DK–219) **Report on the Ministry of Energy's statement regarding subsection 2 of section 12 of act number 293 of 10th June 1981, on the utilization of Denmark's subterranean committee on 26th October 1988.** Det Energipolitiske Udvalgs beretning, 2. Energipolitisk Udvalg, Copenhagen (Denmark). 6 Dec 1988. 12p. (In Danish). Order Number DE90719068. Available from NTIS (US Sales Only), PC A03/MF A01.

Det Energipolitiske Udvalgs beretning, 2.

The report on the Ministry of Energy's statement regarding subsection 2 of section 12 of act no. 293 of 10th June 1981 on the utilization of Denmark's subterranean areas, delivered to the Energy Policy Committee on 26th October 1988, concerns the government's plans for giving permission for investigations of the resource potentials and the recovery of hydrocarbons in Danish underground areas to various companies. Economic and environmental aspects are dealth with and the opinions of some Danish political parties on the subject are described. Conditions for granting similiar concessions in Norway, England, Ireland and Holland are compared with those found in Denmark, and the subject of Danish government subsidies granted to research and training activities in this field is elaborated. A list of research projects is given. Other relevant questions, and the answers given to them by the Danis Ministry of Energy, appear in the supplements. (AB).

2140 Analysis of natural fractures observed by borehole video camera in a horizontal well. Overbey, W.K. (BDM Corp. (US)); Yost, L.E.; Yost, A.B. vp of SPE joint Rocky Mountain regional/low permeability reservoirs symposium and exhibition. Society of Petroleum Engineers, Richardson, TX (1988). (CONF-890354–: SPE joint Rocky Mountain regional meeting and low permeability reservoir symposium, Denver, CO (USA), 6-8 Mar 1989).

Technical Paper SPE 17760.

A video camera survey was used to examine 2217 feet of horizontal wellbore. The air-drilled hole was clean and generally free of debris. More than 200 curvalinear features were noted in the wellbore which were interpreted to be natural fractures. A method of orienting the features observed was developed and tested by building a replica of a section of a wellbore and examining features with known inclination and orientation. Special video enhancement and playback equipment was used to examine the video tape and orient features in the wellbore. This method of analysis provides information useful in designing completions and stimulations in low-pressure reservoirs.

2141 Multi-mechanistic approach to the reservoir analysis of tight blanket sands. Bezilla, M. (Pennsylvania State Univ. (US)); Ertekin, T.; Adewumi, M.A.; Frohne, K.H. vp of SPE joint Rocky Mountain regional/low permeability reservoirs symposium and exhibition. Society of Petroleum Engineers, Richardson, TX (1988). (CONF-890354–: SPE joint Rocky Mountain regional meeting and low permeability reservoir symposium, Denver, CO (USA), 6-8 Mar 1989).

Technical Paper SPE 18983.

Tight sand formations, because of their peculiar characteristics, do not conform to the well established behavioral patterns normally associated with conventional natural gas reservoirs. It is believed that the major bottleneck in the development of these resources is the lack of understanding of the fluid dynamics in these formations. It is therefore imperative to evolve a good model based on a fundamental understanding of the rather unique physics of flow in this media. This physics calls for the use of dual-porosity, multi-mechanistic approach for the description of the transport of natural gas in these formations. Such a model is presented in this paper. Both synthetic and actual field examples are used to illustrate the predictive capability of the model. Results show that the conventional single-mechanistic approach tends to under-predict recovery. They also demonstrate that the dual-mechanistic approach is of the essence.

0303 Drilling, Production, and Processing

2142 (DOE/METC–89/6103) **Proceedings of the natural gas R&D contractors review meeting.** Komar, C.A.; Malone, R.D.; Byrer, C.W. USDOE Morgantown Energy Technology Center, WV (USA). Apr 1989. 476p. Sponsored by U.S. DOE Fossil Energy. (CONF-890492–: Natural gas research and development, Morgantown, WV (USA), 18-19 Apr 1989). Order Number DE89011683. Available from NTIS, PC A20/MF A01 - OSTI; GPO Dep.

The purpose of this meeting is to present key results of research in the DOE sponsored Natural Gas Program and to simultaneously provide real time technology transfer to the interested public. Over the past year, the DOE Natural Gas Research and Development program has been broadened in scope to include emphasis on the geoscience aspects that relate to eventual gas recovery, gas utilization, and research to recover additional gas from producing or previously produced fields. Major emphasis is on activities in Eastern Gas, Western Gas, Secondary Gas Recovery, Natural Gas to Liquids, Gas Hydrates, Deep Gas and Arctic/Offshore Research. Forty-one papers and fifteen poster presentations were given in seven formal sessions and one informal session: Two General Sessions, Natural Gas to Liquids, Eastern Gas, Western Gas, Hydrates/Deep Gas, and Arctic/Offshore. Individual projects are processed separately for the data bases.

2143 (PB–89-230627/XAB) **Baseline testing of the Stretford Process on the GRI 120-liter bench-scale liquid redox sulfur recovery unit. Topical report.** Trofe, T.W.; Dalrymple, D.A.; Andrews, B.M. Radian Corp., Austin, TX (USA). Mar 1989. 133p. (DCN–88-218-043-43). Available from NTIS, PC A07/MF A01.

Liquid redox sulfur-recovery processes are of interest to the natural gas industry for treatment of sour reserves of conventional gas and of substitute natural gas (e.g., gas produced from gasifying coal). These processes offer high H_2S removal efficiency, one-step treatment, low energy requirements, the ability to handle low- and high-H_2S streams, and a regenerating catalyst. Sulfur is removed as gaseous H_2S and converted either to sulfur cake, a disposable waste, or to elemental sulfur which can be sold. Liquid redox processes have complex chemistries and can experience operating problems and less-than-design performance. This class of processes includes Hiperion, LO-CAT, Stretford, SulFerox, Sulfolin, and

Unisulf. The Gas Research Institute's liquid redox sulfur-recovery research program has initially focussed on gaining a better understanding of the Stretford process. Stretford is the oldest of the liquid redox processes and has over 100 plants in operation. The factors examined were feedgas CO_2 and H_2S concentrations, pH, temperature, ADA concentration, citrate, air rate, and reactor residence time. The second objective of the testing was to compare the performance of the 120-liter (32 gallon) GRI bench unit to the 500-gallon pilot unit at the Great Plains Gasification Plant (GPGP) near Beulah, North Dakota.

2144 (PB–89-235105/XAB) **Canadian natural gas: Export potential.** DataMetrics Ltd., Calgary, AB (Canada). Oct 1988. 13p. Available from NTIS, PC A03/MF A01.

See also PB–89-133821.

A study examined a range of possible exports based on a variety of assumptions concerning the price of oil and the size of the Canadian gas resource base. While results show that the available export volumes are sensitive to prices and resource estimates, the cumulative amount of Canadian gas that could be delivered to U.S. markets over the projection period (1986-2005) could be sufficient to satisfy the cumulative need for Canadian exports as projected by GRI.

2145 (PB–89-236590/XAB) **Commercial building research workshop. July 30-31, 1986.** ACEC Research and Management Foundation, Washington, DC (USA). Dec 1986. 38p. Available from NTIS, PC A03/MF A01.

GRI sponsored a workshop in Chicago on July 30-31, 1986 to review the commercial space conditioning and cogeneration research program at GRI. The objectives of the workshop were to solicit input to the R&D program and to expedite technology transfer by encouraging involvement in early review and field testing of prototypes. The workshop focused on the needs of three major market segments: hotels, large office buildings, and hospitals. The workshop agenda and a list of participants are presented along with findings and recommendations, and a discussion paper.

See also PB–88-190665.

This report contains petrographic data and information about pore quality and distribution for thin sections taken from thirty MWX (Multiwell) cores recovered from three different wells and four depositional environments. Data were acquired using both transmitted and epifluorescent light microscopy. Trends are noted relating sample composition and pore quality to depositional environment; various petrophysical properties and features visible in thin section are related. Four samples from the marine zone have been added to advanced core analysis results. Effects of acetic acid treatment on cores containing mineralized fractures were investigated. Chemical treatment to determine mineralogic controls over flow properties continues, with HCl, NaOH, and oxalic acid being utilized as the reagents. Capillary pressure measurements made by centrifugation and mercury injection experiments are compared for six samples. Data relating gas permeability to electrical conductivity are reported for five samples; brine permeability-formation factor relationships are reported for one of these samples.

2147 **Inducing multiple hydraulic fractures from a horizontal wellbore.** Overbey, W.K. (BDM Engineering Services Corp. (US)); Yost, A.B.; Wilkins, D.A. vp of SPE joint Rocky Mountain regional/low permeability reservoirs symposium and exhibition. Society of Petroleum Engineers, Richardson, TX (1988). (CONF-890354–: SPE joint Rocky Mountain regional meeting and low permeability reservoir symposium, Denver, CO (USA), 6-8 Mar 1989).

Technical Paper SPE 18249.

A series of stimulations were designed to open and propagate natural fractures known to exist along a 2000 foot horizontal well in Wayne County, West Virginia. The stimulations were also designed to induce fractures in the formation as well as propagate the natural fractures by manipulating pressure and injection rates. A number radioactive tracers were used to determine where fractures were opened and propagated at different injection rates. The tracers were found in fractures in zones other than the one pumped into, a fact considered prima facie evidence that natural fractures with two or more orientations had been opened and propagated. Pressure testing and gas sampling of the isolated zones confirm that fracture communication was accomplished along nearly 1000 feet of borehole by stimulation of one 400 foot long section. A technique for including multiple hydraulic fractures with multiple orientations is demonstrated.

2148 **Understanding the effect of natural fractures on the hydrofracture stimulation of gas reservoirs.** Heuze, F.E. (Lawrence Livermore National Lab. (US)); Shaffer, R.J.; Blair, S.C.; Thorpe, R.K. vp of SPE joint Rocky Mountain regional/low permeability reservoirs symposium and exhibition. Society of Petroleum Engineers, Richardson, TX (1988). DOE Contract W-7405-ENG-48. (CONF-890354–: SPE joint Rocky Mountain regional meeting and low permeability reservoir symposium, Denver, CO (USA), 6-8 Mar 1989).

Technical Paper SPE.

This paper describes a finite element model for propagation of discrete fractures which has been coupled to an implicit time-dependent fluid flow capability to be used as a predictive tool for hydraulic fracturing through sandstones lenses, as found in the Western Tight Gas Sands. Validation of the model is obtained by simulating controlled physical experiments. The authors' numerical model, FEFFLAP, was used to replicate the extension of a single-wing crack, driven through gypsum cement into a sandstone lens. Pressure-time records from the model and the experiments are compared.

2149 (DOE/EIA–0145(88)) **Statistics of interstate natural gas pipeline companies, 1988.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. 6 Nov 1989. 231p. Sponsored by U.S. DOE Management & Administration. Order Number DE90003070. Available from NTIS, PC A11/MF A01 - GPO - OSTI; GPO Dep.

The Statistics of Interstate Natural Gas Pipeline Companies 1988, presents financial and operating information of all major interstate natural gas pipeline companies that operated in the United States during 1988. This report is used by the Federal Energy Regulatory Commission (FERC), state utility commissions, other government agencies, and the general public. The information is taken from FERC Form 2, "Annual Report of Major Natural Gas Companies," as filed with the Federal Energy Regulatory Commission.

2150 (PB–89-232649/XAB) **Development of short-term tests for evaluating plastic gas-piping materials. Annual report, January-December 1984.** Cassady, M.; Hulbert, L.; Krishnaswamy, P.; Lustiger, A.; Uralil, F. Battelle Columbus Div., OH (USA). Jan 1986. 36p. Available from NTIS, PC A03/MF A01.

The Slow Crack Growth test was demonstrated by gas utilities to be one of the useful methods for studying the fracture resistance of polyethylene pipe. In the same way, the Constant Tensile Load test was shown to be an accelerated method for quality assurance testing for lot-to-lot variation in pipe received by gas utilities. The Rapid Crack Propagation study resulted in a design procedure that allows

gas utilities to predict conditions in gas-piping systems that will result in arrest of rapidly propagating cracks. Reports will be published on each topic and on the set of field failures prepared to date.

0330 Properties

2151 (PB–89-222608/XAB) **Tables for the thermophysical properties of methane. Technical note.** Friend, D.G.; Ely, J.F.; Ingham, H. National Inst. of Standards and Technology, Boulder, CO (USA). Thermophysics Div. Apr 1989. 489p. (NIST/TN–1325). Available from NTIS, PC A21/MF A01.

Also available from Supt. of Docs. as SN003-003-02947-5.

The thermophysical properties of methane are tabulated for a large range of fluid states based on recently formulated correlations. For the thermodynamic properties, temperatures from 91 to 600 K at pressures less than 100 MPa are included. For the viscosity, the corresponding range is 91 - 400 K with pressures to 55 MPa, while for the thermal conductivity the range is 91 - 600 K with pressures to 100 MPa. In addition to the tables of properties, algebraic expressions and associated tables of coefficients are given to allow additional property calculations. Tables of comparisons between experimental property determinations and the correlations are also given both for primary data used in the formulation of the correlations and for additional data. A listing of a FORTRAN program for the evaluation of methane thermophysical properties using the Schmidt-Wagner equation of state is included.

2152 (PB–89-230635/XAB) **Pulsating catalytic combustion of gaseous fuels. Final report, January 1987-September 1988.** Gal-Ed, R.; Daniel, B.R.; Zinn, B.T.; Gemmer, R.V. Georgia Inst. of Tech., Atlanta, GA (USA). School of Aerospace Engineering. Apr 1989. 128p. Available from NTIS, PC A07/MF A01.

The research determined the feasibility of using pulsations to improve the catalytic combustion of gaseous fuels. An experimental setup that could be operated under pulsating and steady-flow conditions was used to determine the dependence of the combustion efficiency of a catalytic combustor, consisting of one to four monolith catalyst sections, upon the reactive mixture temperature, velocity and air/fuel ratio, the type of fuel, the amplitude and frequency of pulsations, and the location of the catalytic combustor relative to the excited acoustic wave. Tests have shown that depending upon operating conditions and the fuel used, the excitation of pulsations can increase the combustion efficiency by up to 50%, modify the reaction rate distribution, change the stability of operation, and cause extinguishment. Significantly, it is shown that the effect of pulsations strongly depend upon the location of the catalyst sections relative to the excited acoustic-wave structure and the amplitude of pulsations.

2153 (PB–89-231583/XAB) **Laser probes of natural gas ignition chemistry. Annual report, January-December 1988.** Crosley, D.R.; Smith, G.P.; Golden, D.M. SRI International, Menlo Park, CA (USA). Jan 1989. 128p. (SRI-MP–89-038). Available from NTIS, PC A07/MF A01.

See also report for 1987, PB–88-212568.

This research, funded by the Physical Sciences Department of the Gas Research Institute, is aimed at developing and using laser-induced fluorescence of various hydrocarbon species as probes in natural gas combustion research and at developing an understanding of the mechanisms of ignition, catalytic combustion, and flame chemiluminescent emission of gas. In a collaborative effort with researchers from Yale University, LIF measurements were made of OH radicals and temperatures above a catalytically augmented gas-phase combustor at low pressure, showing the influence of catalytic surfaces at various mixing ratios. Laser-induced fluorescence diagnostics of C_2H_2, an important natural-gas ignition-chemistry intermediate, were developed in a low-pressure cell and in low pressure flames; both direct fluorescence excitation and the production of C_2 photofragment luminescence were investigated. Spectral-line overlaps between O atom and O_2 molecule excitations leading to photochemical interference were evaluated in flames. Unimolecular reaction-rate theory was applied to the study of the methyl and ethyl radical decomposition reactions, and several bimolecular metathesis and pressure-dependent bimolecular reactions were studied using transition-state theory. A methane flame chemistry code was implemented on the laboratory computer.

2154 (PB–89-229652/XAB) **Dike insulation for LNG (liquefied natural gas) vapor mitigation. Topical report, September 1987-December 1988.** Atallah, S.; Peterlinz, M.E.; Shah, J.N. Risk and Industrial Safety Consultants, Inc., Des Plaines, IL (USA). 1 May 1989. 35p. Available from NTIS, PC A03/MF A01.

See also PB–89-229660.

Insulating materials may be applied to the surfaces of LNG impoundment areas in order to reduce the rate of heat transfer from the ground to any accidentally released LNG. This would result in a reduction of the extent of the flammable vapor cloud. Numerous studies have been carried out to develop dike insulating materials and to evaluate and compare their thermal and physical properties. This report summarizes the results of these studies. The authors conclude that an insulating polymer concrete (IPC) exhibits the most desirable thermal and mechanical characteristics. Design guidelines for the proper installation of IPC on LNG-impoundment surfaces and procedures for estimating total initial and annual maintenance costs are provided.

2155 (DOE/LC/11066–2719-Vol.1) **Beneficiation-hydroretort processing of US oil shales, Volume 1: Final report.** Alabama Univ., University, AL (USA). Mineral Resources Inst.; Hycrude Corp., Chicago, IL (USA). Jan 1989. 150p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG21-85LC11066. Order Number DE89011684. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This report has been divided into three volumes. Volume I describes the MRI beneficiation work. In addition, Volume I presents the results of joint beneficiation-hydroretorting studies and provides an economic analysis of the combined beneficiation-hydroretorting approach for processing Eastern oil shales. Volume II presents detailed results of hydroretorting tests made by MYCRUDE/IGT on raw and beneficiated oil shales prepared by MRI. Volume III comprises detailed engineered design drawings and supporting data developed by the Roberts and Schafer Company, Engineers and Contractors, Salt Lake City, Utah, in support of the capital and operating costs for a conceptual beneficiation plant processing in Alabama oil shale. 26 refs., 10 figs., 23 tabs.

2156 (DOE/LC/11075–2737) **Development of a reservoir simulation for thermal recovery of heavy oils/tar sands in the presence of gas hydrates: Final report.** Kamath, V.A.; Godbole, S.P. Alaska Univ., Fairbanks, AK (USA). Petroleum Development Lab. Oct 1988. 375p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG21-86LC11075. Order Number DE89011701. Available from NTIS, PC A17/MF A01 - OSTI.

The primary goal of this study was to determine the effect of presence of gas hydrates on the performance of thermal recovery methods such as steamflooding of heavy oils and tar sand bitumens. In order to achieve this goal, three models have been developed. The first model provides a fully implicit, r-z, finite difference simulation of hydrate dissociation for a reservoir containing only layered hydrates. The second model is a fully implicit, r-z, finite difference reservoir simulator which allows prediction of performance of a steamflood for a reservoir containing layered hydrates in conjunction with a zone of heavy oil/tar sands. For the third model, it is considered that the reservoir contains uniformly distributed packs of

gas hydrates within a heavy oil or tar sand zone. The report provides detailed equations, numerical solution approach for all the three models. A user friendly, interactive, menu-driven computer software for the fundamental hydrate dissociation model was developed and the program listing is provided. This model has been fully validated with other finite element type models. The results of the fundamental hydrate dissociation model are provided, and discussed. The other two models have also been computer coded. 24 refs., 19 figs., 3 tabs.

0410 Environmental Aspects

2157 (PB–89-226484/XAB) **Unocal Parachute Creek shale-oil Program. Environmental Monitoring Plan quarterly report, fourth quarter, 1988. Report for 1 October-31 December 1988.** Unocal Corp., Parachute, CO (USA). Energy Mining Div. 28 Feb 1989. 552p. (REPT–88-4Q). Available from NTIS, PC A24/MF A01.

The Energy Security Act of 1980 established a program to provide financial assistance to private industry in the construction and operation of commercial-scale synthetic-fuels plants. The Parachute Creek Shale Oil Program is one of four projects awarded financial assistance. The support agreement included development of an Environmental Monitoring Plan incorporating existing compliance monitoring and supplemental monitoring on water, air, solid waste, worker health and safety, and socio-economic impacts during the period 1986-1993. Phase I of the project is to produce 10,000 barrels per day of syncrude from oil shale, using the Unishale 'B' process. The report contains results of industrial hygiene monitoring, a summary of supplemental sampling activities, and copies of compliance-monitoring reports. Details of an independent audit of the compliance programs are provided also. Approximately 30 pages of text and 519 pages of data sheets or reports are included.

2158 (PB–89-226492/XAB) **Unocal Parachute Creek Shale Oil Program. Environmental Monitoring Plan quarterly report, first quarter, 1989. Report for 1 January 1989-31 March 1989.** Unocal Corp., Parachute, CO (USA). Energy Mining Div. 31 May 1989. 636p. (REPT–89-1Q). Available from NTIS, PC A99/MF A01.

Sponsored by U.S. Arms Control and Disarmament Agency; U.S. DOE Assistant Secretary for International Affairs and Energy Emergencies; U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 12. international meeting on reduced enrichment for research and test reactors; Berlin (Germany, F.R.); 10-13 Sep

1989. Order Number DE90001435. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Progress has continued on the fabrication of fuel plates with fuel zone loadings approaching 9gU/cm^3. Using Hot Isostatic Pressing (HIPping) successful diffusion bonds have been made with 110 Al and 6061 Al alloys. These bonds demonstrated the most critical processing step for proof-of-concept hardware. Two types of prototype highly-loaded fuel plates have been fabricated. First, a fuel plate in which 0.030 in. (0.76 mm) uranium compound wires are bonded within an aluminum cladding and second, a dispersion fuel plate with uniform cladding and fuel zone thickness. The successful fabrication of these fuel plates derives from the unique ability of the HIPping process to produce diffusion bonds with minimal deformation. 2 refs., 3 figs.

2165 (WSRC-RP-89-355) **Improved neutron monitor systems for Savannah River Site separations facilities.** Griffin, J.C. Westinghouse Savannah River Co., Aiken, SC (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-8910260--1: Plutonium/uranium recovery operations conference, Oak Ridge, TN (USA), 24-26 Oct 1989). Order Number DE90001307. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Savannah River Laboratory (SRL), in conjunction with Savannah River Site (SRS) Separations Technology personnel, has developed and implemented a comprehensive program to improve the performance and reliability of neutron detector systems (neutron monitors) in the SRS separations areas. The neutron monitors, which monitor the buildup of fissile material in the mixer-settler banks of the solvent extraction process, are important nuclear safety control devices. A review of the performance history of the neutron monitors reveals that many of the systems exhibit problems arising from several causes, including: low neutron sensitivity, high susceptibility to electromagnetic interferences (due to long cable runs between detectors and their electronics), and high maintenance requirements. To address these problems, the neutron monitor improvement program encompasses both technical and administrative improvements, including: substitution of more sensitive neutron monitors at many locations in the solvent extraction areas, the development of an integrated preamplifier/amplifier package to eliminate long cable runs, and improvements in the neutron monitor functional test procedures to reduce maintenance requirements. The implementation of these improvements, already partially complete, is expected to provide enhanced operation and reliability for the neutron monitors. This paper will present a description of the solvent neutron monitors as well as technical details of the improvement program. 2 refs., 5 figs., 1 tab.

2166 (BNWL-CC-2048) **The reaction of gaseous Iodoethane with silver nitrate.** du Plessis, L.A. Battelle Pacific Northwest Lab., Richland, WA (USA). 14 Mar 1969. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE90001662. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Airborne radioactive wastes from nuclear fuel reprocessing plants are rigorously controlled. The most important of the volatile fission products is ^{131}I, whose significance as an airborne waste product stems from the low permissible concentration in air for inhalation and from the marked potential for concentration in food chains leading to man. Iodine is effectively removed from off-gases by passing the stream through heated beds of Berl saddles which have been coated with silver nitrate. These beds were developed on the assumption that elemental iodine alone is present; however, it is suspected that some of the iodine in reprocessing plants is present as organic iodides, particularly iodomethane. It is of interest to know what reactions take place between silver nitrate and gaseous organic iodides and how fast these reactions are. This study was undertaken to gain better understanding of the reactions of organic iodides and silver nitrate. Iodomethane was used in these laboratory studies rather than iodomethane to avoid the unstable methyl nitrate which is a product of the reaction between methyl iodide and silver nitrate. Helium was used as an inert sweep gas for the iodomethane to avoid results complicated by side reactions. 11 refs., 10 figs., 4 tabs.

2170 (ORNL/TM-11023) **Results of the Manipulator Test Test Stand study: Comparison of manipulators and evaluation of equipment items.** Kring, C.T.; Schrock, S.L.; Draper, J.V.; Hayashi, S.; Kawakami, H.; Horii, S.; Omori, E.; Fujita, Y. Oak Ridge National Lab., TN (USA). Aug 1989. 36p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90000977. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes the results of a study jointly conducted by staff members of the Consolidated Fuel Reprocessing Program at the Oak Ridge National Laboratory (ORNL) in the United States and the Power Reactor and Nuclear Fuel Development Corporation (PNC) in Japan. This study was initiated under the Remote Systems Technology Exchange Program and continued as part of the Joint Collaboration on Reprocessing Technology, each representing agreements between the United States Department of Energy and PNC. The purpose of the study was to evaluate the performance of servomanipulator systems developed by the respective participants as part of their in-cell maintenance systems for use in future nuclear fuel reprocessing facilities. The following servomanipulators were tested: (1) the Central Research Laboratory's model M-2, (2) the advanced servomanipulator (ASM), and (3) the Meidensha Prototype-2 (P-2). A series of experimental tasks and a test platform called the Manipulator Test Test Stand (MTTS) were jointly designed by ORNL and PNC. An evaluation of the servomanipulator system was based on the time required to complete these tasks. PNC and ORNL consider these tasks to be typical of those required for future reprocessing applications. 1 ref., 10 figs., 5 tabs.

2171 (WHC-SA-0616) **Recent plutonium metal production experience at Hanford.** Gibson, M.W.; Nyman, D.H. Westinghouse Hanford Co., Richland, WA (USA). Oct 1989. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. (CONF-891103--46: Winter meeting of the American Nuclear Society, San Francisco, CA (USA), 26-30 Nov 1989). Order Number DE90003361. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Plutonium metal is produced at the Hanford Site in the Remote Mechanical C (RMC) line. The line is housed in the Plutonium Finishing Plant (PFP). The RMC line was built in the early 1960s and operated until 1973 when it was shut down. The line was restarted in 1985 and has operated on a campaign basis since that time. The

fiscal years (FY) 1988/89 RMC line campaigns have shown improved yields and plant safety performance when compared to previous years. This is attributed to numerous process improvements that have been made in the line and to an enhanced standard of disciplined operations. This report discusses the improvements made to the RMC line.

2172 (INIS-BR–1721) **Safety in transport and storage of radioactive materials.** Mezrahi, A.; Xavier, A.M. Instituto Brasileiro do Petroleo, Rio de Janeiro, RJ (Brazil). 1987. 19p. (In Portuguese). (CONF-8705395–: 5. Seminar on Industrial Safety, Fortaleza (Brazil), 26-29 May 1987). Order Number DE90608621. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The increasing utilization of radioisotopes in Industrial, Medical and Research Facilities as well as the processing of Nuclear Materials involve transport activities in a routine basis. The present work has the following main objectives: (I) the identification of the safety aspects related to handling, transport and storage of radioactive materials; (II) the orientation of the personnel responsible for the radiological safety of Radioactive Installations viewing the elaboration and implementation of procedures to minimize accidents; (III) the report of case-examples of accidents that have occured in Brazil due to non-compliance with Transport Regulations. (author).

2173 (NUREG–0383-Vol.1-Rev.12) **Directory of certificates of compliance for radioactive materials packages: Report of NRC approved packages: Volume 1, Revision 12.** Nuclear Regulatory Commission, Washington, DC (USA). Div. of Safeguards and Transportation. Oct 1989. 476p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A21/MF A01 - GPO - OSTI.

The purpose of this directory is to make available a convenient source of information on packaging which have been approved by the US Nuclear Regulatory Commission. To assist in identifying packaging, an index by Model Number and corresponding Certificate of Compliance Number is included at the front of Volume 2 of the directory. A listing by packaging types is included in the back of Volume 2. An alphabetical listing by Company name is included in the back of Volume 3 for approved QA programs. The reports include a listing of all users of each package design and approved QA programs prior to the publication date of the directory. Shipments of radioactive material utilizing these packages must be in accordance with the provisions of 49 CFR §173.471 and 10 CFR Part 71, as applicable. In satisfying the requirements of Section 71.12, it is the responsibility of the licensees to insure themselves that they have a copy of the current approval and conduct their transportation activities in accordance with a Nuclear Regulatory Commission approved quality assurance program.

2175 (AEEW-M–2536) **Immobilisation in cement of ion exchange resins arising from the purification of reagents used for the decontamination of reactor circuits. Fourth semestrial report January-June 1988.** Howard, C.G.; Jolliffe, C.B.; Lee, D.J. UKAEA Atomic Energy Establishment, Winfrith (UK). Chemistry Div. Sep 1988. 27p. (CPDG–(88)-P118). Order Number DE90608837. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The process developed previously for the immobilisation of Ion Exchange resin in cement has been scaled up to 200 litres. Large scale samples produced exhibit acceptable compressive strengths and dimensional stabilities. Destructive examination has shown that these samples are homogeneous and monolithic. A number of samples have been stored under water, this appears to have no detrimental effects on the dimensional stability and elastic modulus when compared to samples stored in air. Finally, a description of leach test work initiated using waste ion exchange resin treated with LOMI from the reactor at Winfrith is given. This work will be performed in accordance with the ISO leach test procedure. (author).

2176 (AEEW-R–1903) **Ultrasonic and immersion cleaning: a comparison using aqueous and fluorocarbon solvents.** Bond, R.D.; Kearsey, A. UKAEA Atomic Energy Establishment, Winfrith (UK). Materials Technology Div. Nov 1984. 30p. Order Number DE90608332. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Decontamination is a necessary process in reducing radiation levels in the working environment in the nuclear industry. Components from active areas which require decontamination for re-use or maintenance operations. In this report, a typical chemical cleaning process using liquid pumping, air agitation and physical movement for agitation is compared with ultrasonic cleaning, now an established cleaning process in many industries. The chosen traditional method is immersion in an agitated solution of warm SDG.3 solution; an established decontaminating reagent. The decontamination effect of this process is compared with the effect of cleaning in an ultrasonic bath containing the same reagent at the same concentration and temperature. Fluorocarbon reagents are of particular interest to the nuclear industry for they offer the ability to clean electrical components without damage, and can clean product contaminated material without the risk of criticality. Such reagents are based on 1,1,2-trichloro, 1,2,2-trifluoroethane and azeotropic mixtures. This reagent and one mixture with 6% methanol were tested under agitation and ultrasonic immersion at the same temperature. Parallel control experiments were conducted using demineralised water as the cleaning media in an agitated bath. SGG3 is a good reagent for general purpose cleaning (it can remove 99% of particulate contamination) using scrubbing, immersion or spraying techniques. There is little evidence to show that ultrasonic cleaning increases its effectiveness. For special purpose fluorocarbon solvents will give satisfactory results when used in an ultrasonic system. (author).

2177 (AEEW-R–2094) **Rheological measurements on cement grouts.** Dalton, M.J. UKAEA Atomic Energy Establishment, Winfrith (UK). Chemistry Div. Jun 1986. 34p. Order Number DE90608838. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This report describes the techniques which have been developed at Winfrith for assessing the rheological properties of cement grouts. A discussion of the theory of rheology and its application to cement is given and the methodology for calibrating a special paddle measuring system for a commercial viscometer is described. The use of the system for determining flow curves, equilibrium viscosity, viscosity as a function of shearing time and structure changes is also discussed. (author).

2178 (AERE-R–12939) **Evolution of pH in a radwaste repository: internal reactions between concrete constituents.** Atkinson, A.; Everitt, N.M.; Guppy, R.M. UKAEA Harwell Lab. (UK). Materials Development Div. Jan 1988. 46p. (DOE-RW–89.025(pt.2)). Available from H.M. Stationery Office, London, price Pound 10.00.

The pH is an important characteristic of the chemical conditions within a radioactive waste repository. A high pH is particularly beneficial from a variety of points of view and this can be assured by the use of cementitious materials within the repository. Reactions between repository components which have an influence on pH have been studied in accelerated laboratory experiments. The reactions studied were those occurring in modified cements (specifically 90% pulverized fly ash/10% ordinary Portland cement and 90% blast furnace slag/10% OPC) and between aqueous calcium hydroxide and both crystalline and amorphous SiO_2. The experiments indicate that extensive use of fuel ash leads to uncertainty in long term pH which could be as low as 9 to 10 in such cases. Experiments with crystalline calcium silicon hydrate (CSH) minerals suggest that crystallization of amorphous CSH could also lead to pH being lower than the optimum. (author).

2179 (AERE-R–12955) **Management of tritium wastes in the United Kingdom. A survey of present and future arisings, review of possible disposal options and areas where further R and D may be needed to develop a management strategy for the future.** Jones, D.V.C.; McHugh, G. UKAEA Harwell Lab. (UK). Materials Development Div.; Department of the Environment, London (UK). Oct 1988. 82p. (DOE-RW–89.004). Available from H.M. Stationery Office, London, price Pound 14.00.

A site specific survey of current and future amounts of tritium produced and subsequent waste arisings in the UK has been carried out. Various management options in addition to that of dilute and disperse have been indicated as possible disposal strategies for the future. Their impact on the dose received by the UK population, specific groups and the rest of the world has been assessed by the NRPB. This assessment shows that the present disposal strategy results in doses to the UK population which are considered insignificant in terms of risk and will remain so as the civil reactor programme increases in the future. The study also indicates that the extent to which tritium is used in research, medicine, industry and for consumer applications needs to be assessed. It will enable a more complete management strategy for the future to be defined. (author).

2180 (CONF-891053–5) **Effectiveness of interim remedial actions at a radioactive waste facility.** Devgun, J.S.; Beskid, N.J.; Peterson, J.M.; Seay, W.M.; McNamee, E. Argonne National Lab., IL (USA). [1989]. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 28. Hanford life sciences symposium on environmental monitoring, restoration and assessment: what have we learned?; Richland, WA (USA); 16-19 Oct 1989. Order Number DE90001940. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Over the past eight years, several interim remedial actions have been taken at the Niagara Falls Storage Site (NFSS), primarily to reduce radon and gamma radiation exposures and to consolidate radioactive waste into a waste containment facility. Interim remedial actions have included capping of vents, sealing of pipes, relocation of the perimeter fence (to limit radon risk), transfer and consolidation of waste, upgrading of storage buildings, construction of a clay cutoff wall (to limit the potential groundwater transport of contaminants), treatment and release of contaminated water, interim use of a synthetic liner, and emplacement of an interim clay cap. An interim waste containment facility was completed in 1986. 6 refs., 3 figs.

2181 (CONF-891197–2) **Nondestructive assay and nondestructive examination of remote-handled transuranic waste at the ORNL waste handling and packaging plant.** Schultz, F.J.; Caldwell, J.T. Oak Ridge National Lab., TN (USA). [1989]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. From Topical meeting on non-destructive assay of radioactive waste; Cadarache (France); 20-22 Nov 1989. Order Number DE90003076. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The purpose of this investigation is to examine the use of an electron linear accelerator (LINAC) in the performance of nondestructive assay (NDA) and nondestructive examination (NDE) measurements of remote-handled transuranic wastes. The system will be used to perform waste characterization and certification activities at the Oak Ridge National Laboratory's proposed Waste Handling and Packaging Plant. The NDA and NDE technologies which were developed for contact-handled wastes are inadequate to perform such measurements on high gamma and neutron dose-rate wastes. A single LINAC will provide the interrogating fluxes required for both NDA and NDE measurements of the wastes. 11 refs., 6 figs.

2182 (CONF-8906240–1) **Impact of technology applications to the management of low-level radioactive wastes.** Devgun, J.S. Argonne National Lab., IL (USA). [1989]. 17p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 8. annual meeting on impact assessment in an age of transformation; Montreal (Canada); 24-28 Jun 1989. Order Number DE90002194. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Low-level radioactive wastes are generated from reactor sources (nuclear power reactors) as well as from nonreactor sources (academic, medical, governmental, and industrial). In recent years, about 50,000 m^3 per year of such wastes have been generated in the United States and about 10,000 m^3 per year in Canada. Direct disposal of these wastes in shallow ground has been a favored method in both countries in the past. In the United States, three operating commercial sites at Barnwell, South Carolina; Beatty, Nevada; and Richland, Washington, receive most of the commercial low-level waste generated. However, with recent advances in waste management, technologies are being applied to achieve optimum goals in terms of protection of human health and safety and the environment, as well as cost-effectiveness. These technologies must be applied from the generation sources through waste minimization and optimum segregation – followed by waste processing, conditioning, storage, and disposal. A number of technologies that are available and can be applied as appropriate – given the physical, chemical, and radiological characteristics of the waste – include shredding, baling, compaction, supercompaction, decontamination, incineration, chemical treatment/conditioning, immobilization, and packaging. Interim and retrievable storage can be accomplished in a wide variety of storage structures, and several types of engineered disposal facility designs are now available. By applying an integrated approach to radioactive waste management, potential adverse impacts on human health and safety and the environment can be minimized. 15 refs., 1 fig., 1 tab.

2183 (CONF-8906241–1) **Demonstration of a computer model for residual radioactive material guidelines, RESRAD.** Yu, C.; Yuan, Y.C.; Zielen, A.J.; Wallo, A. III. Argonne National Lab., IL (USA). [1989]. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 30. annual meeting of the Institute of Nuclear Materials Management; Orlando, FL (USA); 12 Jun 1989. Order Number DE90001771. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A computer model was developed to calculate residual radioactive material guidelines for the US Department of Energy (DOE). This model, called RESRAD, can be run on IBM or IBM-compatible microcomputer. Seven potential exposure pathways from contaminated soil are analyzed, including external radiation exposure and internal radiation exposure from inhalation and food digestion. The RESRAD code has been applied to several DOE sites to derive soil cleanup guidelines. The experience gained indicates that a comprehensive set of site-specific hydrogeologic and geochemical input parameters must be used for a realistic pathway analysis. The RESRAD code is a useful tool; it is easy to run and very user-friendly. 6 refs., 12 figs.

2184 (CONF-8910239–3) **Training waste generators: The first responder in proper waste management.** Jones, E. Oak Ridge National Lab., TN (USA). [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. annual TRADE conference; Baltimore, MD (USA); 22-25 Oct 1989. Order Number DE90002087. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Dealing with waste effectively requires a "cradle to grave" approach to waste management. The first step in that chain of custody is the waste generator. The waste generator plays the key role in the correct identification, packaging, and disposal of waste. The Technical Resources and Training Section at the Oak Ridge National Laboratory (ORNL) has developed several short training programs for waste generators. This training presents a consistent approach to proper handling of waste within the ORNL waste management system. This training has been developed for generators

of solid low-level radioactive waste, hazardous and mixed waste, and transuranic waste. In addition to the above, a Waste Minimization training program has been developed for use by all organizations at ORNL who generate any type of hazardous waste. These training programs represent a combined effort of the training staff and the technical staff to assure that all ORNL staff accept their responsibility for handling all types of radioactive and hazardous wastes correctly from its generation to its disposal. 4 refs.

2185 (CONF-8911110–1) **Technology transfer in hazardous waste management.** Drucker, H. Argonne National Lab., IL (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Symposium on environmental perspectives towards the year 2000 and beyond; Bangkok (Thailand); 6-10 Nov 1989. Order Number DE90001905. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Hazardous waste is a growing problem in all parts of the world. Industrialized countries have had to deal with the treatment and disposal of hazardous wastes for many years. The newly industrializing countries of the world are now faced with immediate problems of waste handling. The developing nations of the world are looking at increasing quantities of hazardous waste generation as they move toward higher levels of industrialization. Available data are included on hazardous waste generation in Asia and the Pacific as a function of Gross Domestic Product (GDP). Although there are many inconsistencies in the data (inconsistent hazardous waste definitions, inconsistent reporting of wastes, etc.) there is definite indication that a growing economy tends to lead toward larger quantities of hazardous waste generation. In developing countries the industrial sector is growing at a faster rate than in the industrialized countries. In 1965 industry accounted for 29% of GDP in the developing countries of the world. In 1987 this had grown to 37% of GDP. In contrast, industry accounted for 40% of GDP in 1965 in industrialized countries and dropped to 35% in 1987. This growth in industrial activity in the developing countries brings an increase in the need to handle hazardous wastes. Although hazardous wastes are ubiquitous, the control of hazardous wastes varies. The number of regulatory options used by various countries in Asia and the Pacific to control wastes are included. It is evident that the industrialized countries, with a longer history of having to deal with hazardous wastes, have found the need to use more mechanisms to control them. 2 refs., 2 figs.

2186 (DOE/ID–10233(88)) **Site characterization program at the radioactive waste management complex of the Idaho National Engineering Laboratory: Annual progress report: FY-1988.** McElroy, D.L.; Rawson, S.A.; Hubbell, J.M.; Minkin, S.C.; Baca, R.G.; Vigil, M.J.; Bonzon, C.J.; Landon, J.L.; Laney, P.T. EG and G Idaho, Inc., Idaho Falls, ID (USA). Jul 1989. 54p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE90002005. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

The Radioactive Waste Management Complex (RWMC) Site Characterization Program is a continuation of the Subsurface Investigation Program (SIP). The scope of the SIP has broadened in response to the results of past work that identified hazardous as well as radionuclide contaminants in the subsurface environment and in response to the need to meet regulatory requirements. Two deep boreholes were cored at the RWMC during FY-1988. Selected sediment samples were submitted for Appendix IX of 40 CFR Part 264 and radionuclide analyses. Detailed geologic logging of archived core was initiated. Stratigraphic studies of the unsaturated zone were conducted. Studies to determine hydrologic properties of sediments and basalts were conducted. Geochemical studies and analyses were initiated to evaluate contaminant and radionuclide speciation and migration in the Subsurface Disposal Area (SDA) geochemical environment. Analyses of interbed sediments in boreholes D15 and 8801D did not confirm the presence of radionuclide contamination in the 240-ft interbed. Analyses of subsurface air and groundwater samples identified five volatile organic compounds of concern: carbon tetrachloride, trichloroethylene, 1,1,1-trichloroethane, chloroform, and tetrachloroethylene. 33 refs., 5 figs., 2 tabs.

2187 (DOE/NE–0098) **1988 annual report on low-level radioactive waste management progress.** USDOE Assistant Secretary for Nuclear Energy, Washington, DC (USA). Oct 1989. 154p. Sponsored by U.S. DOE Nuclear Energy. Order Number DE90001779. Available from NTIS, PC A08/MF A01; OSTI; INIS; GPO Dep.

This report summarizes the progress of States and low-level radioactive waste compacts in 1988 in establishing new low-level waste disposal facilities, and also provides summary information on the volume of low-level waste received for disposal in 1988 by commercially-operated low-level waste disposal facilities. The report is in response to Section 7(b) of the Low-Level Radioactive Waste Policy Amendments Act of 1985.

2188 (DOE/RW–0245) **OCRWM program elements change control procedures.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (USA). Aug 1989. 34p. Sponsored by U.S. DOE Radioactive Waste Management. Available from OSTI.

This procedure prescribes responsibilities and the process for the issue, revision, replacement, and transmittal of the OCRWM Program Element-level controlled baselines, documents, and data bases. The Program Elements change control procedure applies to all OCRWM elements and contractors performing work for OCRWM.

2189 (DOE/WIPP–89-007) **Quality assurance guidance for TRUPACT-II [Transuranic Package Transporter-II] payload control.** Westinghouse Electric Corp., Carlsbad, NM (USA). Oct 1989. 74p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-86AL31950. Order Number DE90002490. Available from NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

The Transuranic Package Transporter-II (TRUPACT-II) Safety Analysis Report for Packaging (SARP) approved by the Nuclear Regulatory Commission (NRC), discusses authorized methods for payload control in Appendix 1.3.7 and the Quality Assurance (QA) requirements in Section 9.3. Subsection 9.3.2.1 covers maintenance and use of the TRUPACT-II and the specific QA requirements are given in DOE/WIPP 89-012. Subsection 9.3.2.2 covers payload compliance, for which this document was written. 6 refs.

2190 (DOE/WIPP–89-009-Vol.1) **Geotechnical Field Data and Analysis Report, July 1987–June 1988: Volume 1.** Westinghouse Electric Corp., Carlsbad, NM (USA). Engineering and Repository Technology Dept. Aug 1989. 132p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-86AL31950. Order Number DE90002492. Available from NTIS, PC A07/MF A01; OSTI; INIS; GPO Dep.

The Geotechnical Field Data and Analysis Report (GFDAR) is prepared to provide a timely assessment of the geotechnical status of the Waste Isolation Pilot Plant (WIPP). During the period of shaft sinking and construction of the principal underground access and experimental areas, reporting was on a quarterly basis. Because geotechnical responses of existing underground facilities have slowed to nearly steady-state and excavation of the waste storage panels will take place more slowly and over an extended period, reporting in the coming years will be on an annual cycle. Data collected before June 30 of the year of the report will be presented and analyzed. This report presents and analyzes all data collected between July 31, 1987, and June 30, 1988. 35 refs., 47 figs.

2191 (DOE/WIPP–89-009-Vol.2) **Geotechnical Field Data and Analysis Report, July 1987–June 1988: Volume 2.** Westinghouse Electric Corp., Carlsbad, NM (USA). Engineering and Repository Technology Dept. Aug 1989. 488p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-86AL31950. Order Number DE90002493. Available from NTIS, PC A21/MF A01; OSTI; INIS; GPO Dep.

The Geotechnical Field Data and Analysis Report (GFDAR) is prepared to provide a timely assessment of the geotechnical status of the Waste Isolation Pilot Plant (WIPP). During the period of shaft sinking and construction of the principal underground access and experimental areas, reporting was on a quarterly basis. Because excavation of the waste storage panels will take place more slowly and over an extended period, reporting in the coming years will be on an annual cycle. Data collected before June 30 of the year of the report will be presented and analyzed. This report presents and

analyzes all data collected between July 31, 1987, and June 30, 1988. 3 refs., 410 figs., 30 tabs.

2192 (DOE/WIPP–89-014) **Waste Isolation Pilot Plant (WIPP) TRU waste shipment dry run preoperational checkout plan.** Westinghouse Electric Corp., Carlsbad, NM (USA). Waste Isolation Div. Jun 1989. 13p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-86AL31950. Order Number DE90002491. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a major system acquisition authorized as a research and development facility to demonstrate safe disposal of both remote-handled (RH) and contact-handled (CH) transuranic defense waste in bedded salt. In addition to these full-scale demonstrations, WIPP will provide facilities for experimentation with radioactive materials. This plan documents the scope for the preoperational checkout of the shipment of transuranic defense waste from generator/storage (shipper) sites to the WIPP facility. As readiness is a phased effort, portions or all of this plan may be exercised at a given time. It has been prepared in compliance with the WIPP Waste Transportation Manual, WP 06-2. Results from the preoperational checkout establish the basis for a preoperations checkout report to be used for WIPP and generator/storage site operational readiness review activities. A separate preoperational checkout and preoperational checkout report will be performed and prepared for each site upon completion of the demonstration. 4 refs.

2193 (EGG-M–88181) **Risk assessment and risk management for an experimental nuclear waste processing facility.** Reny, D.A.; Mackowiac, D.P.; Stallman, R.M. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8811282–1: Society of Risk Analysis annual conference, Washington, DC (USA), 1 Nov 1988). Order Number DE90002092. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The purpose of this paper is to describe the application of probabilistic risk assessment (PRA) techniques and risk management of an experimental nuclear waste processing facility. The Process Experimental Pilot Plant (PREPP) is an experimental Transuranic (TRU) waste processing facility. The facility is located at the Idaho National Engineering Laboratory (INEL). PREPP is owned by the US Department of Energy and operated under contract by EG&G Idaho, Inc. 4 refs., 4 figs., 2 tabs.

2194 (EGG-M–89302) **Shielding design for spent fuel shipping in high-capacity truck casks.** Boshoven, J.K.; Su, Shiaw-Der. EG and G Idaho, Inc., Idaho Falls, ID (USA); General Atomics, San Diego, CA (USA). [1989]. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570;AC07-88ID12698. (CONF-891103–37: Winter meeting of the American Nuclear Society, San Francisco, CA (USA), 26-30 Nov 1989). Order Number DE90002076. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

General Atomics (GA), under contract to the US Department of Energy (DOE), is developing a high-capacity legal weight truck transportation system for shipment of pressurized-water-reactor (PWR) and boiling-water-reactor (BWR) spent fuels from commercial nuclear power plants to a repository or monitored retrievable storage facility. The system includes two cask versions optimized for PWR and BWR fuels, respectively. The PWR version carries four fuel assemblies designated the GA-4 cask; and the BWR version accommodates nine fuel assemblies designated the GA-9 cask. This paper presents the shielding aspects of the GA-4 and GA-9 casks. 5 refs., 1 fig.

2195 (EPRI-NP–5673) **Below Regulatory Concern (BRC) Owners Group: A comparison of the EPA generic cost-benefit analysis with an industry-specific analysis: Final report.** Murphy, E.S.; Rogers, V.C. Electric Power Research Inst., Palo Alto, CA (USA); Rogers and Associates Engineering Corp., Salt Lake City, UT (USA). c Nov 1989. 88p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Technical factors associated with the Environmental Protection Agency's proposed dose criterion for the disposal of Low-Level Radioactive Wastes (LLRW) as Below Regulatory Concern (BRC) wastes are reviewed and updated with more recent waste stream data. The new analysis also includes a separate evaluation of the nuclear power plant waste component and a consideration of risks from the transportation of BRC wastes to a disposal site other than a NRC licensed LLRW disposal site. The nuclear power plant analysis supports a higher BRC dose criterion than the generic analysis, which includes nuclear power plant, institutional, and industrial waste streams. 13 refs., 8 figs., 19 tabs.

2196 (EUR–11776) **Performance assessment of geological isolation systems for radioactive waste. Disposal in clay formations.** Marivoet, J.; Bonne, A. Commission of the European Communities, Luxembourg (Luxembourg). 1988. 749p. Available from NTIS (US Sales Only), PC A99/MF A01.

In the framework of the PAGIS project of the CEC Research Programme on radioactive waste, performance assessment studies have been undertaken on the geological disposal of vitrified high-level waste in clay layers at a reference site at Mol (B) and a variant site at Harwell (UK). The calculations performed for the reference site shown that most radionuclides decay to negligible levels within the first meters of the clay barrier. The maximum dose rates arising from the geological disposal of HLW, as evaluated by the deterministic approach are about 10^{-11} Sv/y for river pathways. If the sinking of a water well into the 150 m deep aquifer layer in the vicinity of the repository is considered together with a climatic change, the maximum calculated dose rate rises to a value of 3.10^{-7} Sv/y. The calculated maxima arise between 1 million and 15 million years after disposal. The maximum dose rates evaluated by stochastic calculations are about one order of magnitude higher due to the considerable uncertainties in the model parameters. In the case of the Boom clay the estimated consequences of a fault scenario are of the same order of magnitude as the results obtained for the normal evolution scenario. The maximum risk is estimated from stochastic calculations to be about 4.10^{-8} per year. For the variant site the case of the normal evolution scenario has been evaluated. The maximum dose rates calculated deterministically are about 1.10^{-6} Sv/y for river pathways and 6.10^{-5} Sv/y for a water well pathways; these doses would occur after about 1 million years. This document is one of a set of 5 reports covering a relevant project of the European Community on a nuclear safety subject having very wide interest. The five volumes are: the summary (EUR 11775-EN), the clay (EUR 11776-EN), the granite (EUR 11777-FR), the salt (EUR 11778-EN) and the sub-seabed (EUR 11779-EN).

2197 (EUR–11777) **Disposal in granite formations.** Van Kote, F.; Peres, J.M.; Olivier, M.; Lewi, J.; Assouline, M.; Mejon-Goula, M.J. Commission of the European Communities, Luxembourg (Luxembourg). 1988. 802p. (In French). Available from NTIS (US Sales Only), PC A99/MF A01.

In the framework of the PAGIS project of the CEC Research Programme on radioactive wastes, a performance assessment of a repository of vitrified HLW in granite was carried out. Three disposal sites were considered: the reference site Auriat and two alternative sites, Barfleur and a site in the U.K. The report describes the methodology adopted (a deterministic and a stochastic approach) with the corresponding data base and the models used. A parametric study of sub-systems (near field, far field and biosphere) was carried out by CEA-ANDRA using AQUARIUS, DIMITRIO and BIOS. A global evaluation of the performances was carried out by CEA-IPSN using MELODIE code. The results of deterministic calculations showed for Auriat a maximum dose equivalent evaluated at 6.10^{-3}m Sv/a arising 3 millions years after disposal. Results of human intrusion scenario analyses, uncertainty analyses and global sensitivity analyses are presented. This document is one of a set of 5 reports covering a relevant project of the European Community on a nuclear safety subject having very wide interest. The five volumes are: the summary (EUR 11775-EN), the clay (EUR 11776-EN), the granite (EUR 11777-FR), the salt (EUR 11778-EN) and the sub-seabed (EUR 11779-EN).

2198 (EUR–11778) **Disposal in salt formations.** Storck, R.; Aschenbach, J.; Hirsekorn, R.P.; Nies, A.; Stelte, N. Commission of

the European Communities, Luxembourg (Luxembourg). 1988. 786p. Available from NTIS (US Sales Only), PC A99/MF A01.

In the framework of the PAGIS project of the CEC Research Programme on radioactive waste, a performance assessment of a repository of vitrified HLW in rock salt formations has been carried out. The first volume of the study is split into four tasks. Task 1 recalls the main steps that have led to the selection of the reference and the variant site. Task 2 condenses all information available on the rock formations which are planned to host the repository, the overlying geosphere and the geohistoric development of the sites. Task 3 states the technical details of repository planning, while in Task 4 conceivable release scenarios are discussed. Volume II (Tasks 5 to 10) is concerned with the modelling procedures. In Task 5 data for the waste inventory are collected and the selection of relevant nuclides for transport calculations is discussed. Task 6 gives the near-field modelling, i.e. the models for corrosion of the waste canisters, the degradation of the waste matrix and the models used for the HLW boreholes. Task 7 deals with the modelling of the repository. Its division into sections is discussed and models for physical and chemical effects taken into account in each section are presented. In Task 8 the modelling of the overburden is given. In Task 9 additional models for the subrosion scenario and a human intrusion scenario are given. Task 10 is concerned with the biosphere modelling. In Volume III results of deterministic and probabilistic calculations are presented. Task 11 gives the results for deterministic calculations with best estimate values for the parameters involved in the models. Task 12 presents the result of the uncertainty analysis, and Task 13 those of local and global sensitivity analyses followed by concluding remarks. This document is one of a set of 5 reports covering a relevant project of the European Community on a nuclear safety subject having very wide interest.

2199 (EUR–11779) **Disposal into the sub-seabed.** Mobbs, S.F.; Charles, D.; Delow, C.E.; McColl, N.P. Commission of the European Communities, Luxembourg (Luxembourg). 1988. 815p. Available from NTIS (US Sales Only), PC A99/MF A01.

This report describes an assessment of the radiological impact of sub-seabed disposal of vitrified high level waste, carried out as part of the PAGIS project of the CEC Research Programme on radioactive waste. Where possible the data used in this study have been taken from those provided by the Nuclear Energy Agency Seabed Working Group. The waste was assumed to be placed into the subseabed sediments by means of the free fall penetrator technique. An alternative method, emplacement in a deep borehole, was also studied. Three disposal sites were considered: the reference site Great Meteor East, in the N.E. Atlantic, and two alternative sites: Southern Nares Abyssal Plain in the N.W. Atlantic and Cape Verde Rise in N.E. Atlantic. Models were used to describe the release of radionuclides from the waste, their migration through the sediments, their dispersion in the world oceans and the pathways to man. For the normal evolution scenario, best estimate peak individual dose rates for the penetrator option was evaluated at 2×10^{-10} Sv y^{-1} arising 0.1 million years after emplacement. The collective dose commitment was 10,000 man Sv. The corresponding figures for the borehole option were 2×10^{-14} Sv y^{-1} and 1 man Sv. The risks from seven altered evolution scenarios were also calculated and the risk was predicted to be always less than 10^{-9} y^{-1}. Uncertainty and sensitivity analyses were also performed and showed that the peak dose was most sensitive to variations in Kd values, pore water velocity, pore water diffusivity and burial depth. This document is one of a set of 5 reports covering a relevant project of the European Community on a nuclear safety subject having very wide interest. The five volumes are: the summary (EUR 11775-EN), the clay (EUR 11776-EN), the granite (EUR 11777-FR), the salt (EUR 11778-EN) and the sub-seabed (EUR 11779-EN).

2200 (INIS-mf–12018) **Hydrogeological, geohydraulic and geothermal studies in projected final storage sites for radioactive waste. Pt. 3. Geothermal studies. Final Report.** Kopietz, J. Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hannover (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Sep 1988. 187p. (In German). Contract BMFT KWA 53090;BMFT KWA 85050;BMFT KWA 8504 9/2. Order Number DE90721986. Available from NTIS (US Sales Only), PC A09/MF A01.

The report contains: (1) a survey of the measurements carried out; (2) temperature and temperature gradient logs from the surface rock of the salt dome of Gorleben; (3) isoline and three-dimensional presentations of the surface rock temperatures; (4) temperature and temperature gradient logs from the deep borings Go 1002, 1003 and 1004 and the primary shaft borings Go 5001 and 5002. (orig./HP).

2201 (LA-UR–89-3354) **Analysis of caisson transport experiments by travel time approach.** Nguyen, V.; Dagan, G.; Springer, E.P. Los Alamos National Lab., NM (USA). [1989]. 15p. Sponsored by U.S. DOE Defense Programs; U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-8909261–1: Workshop on field-scale water and solute flux in soils, Monte Verita (Switzerland), 24-29 Sep 1989). Order Number DE90002433. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The transport experiments conducted by Los Alamos National Laboratory in an intermediate-scale caisson are described. The results suggest that the solute spreading pattern has been dominated by the effect of spatial variability of hydraulic properties. A stochastic model of horizontally varying velocity distribution is employed in order to interpret the concentration data in terms of travel time distribution. A satisfactory match between the measured solute mass cross-sectional transfer in saturated flow and model is achieved for a standard deviation of the logconductivity of 1.2. The model may serve for interpretation of transport in unsaturated flow and for reactive solutes. 14 refs., 7 figs.

2202 (LA-UR–89-3355) **Analyses of transport in the upper soil layer and interpretation of caisson experiments.** Dagan, G.; Nguyen, V.; Springer, E. Los Alamos National Lab., NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890928–11: Nuclear waste isolation in the unsaturated zone: FOCUS '89, Las Vegas, NV (USA), 18-21 Sep 1989). Order Number DE90002432. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

2203 (LA-UR–89-3410) **Magnetic separation as a plutonium residue enrichment process.** Avens, L.R.; McFarlan, J.T.; Gallegos, U.F. Los Alamos National Lab., NM (USA). 1989. 39p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891013–6: 6. symposium on separation science and technology for energy applications, Knoxville, TN (USA), 22-27 Oct 1989). Order Number DE90002384. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have subjected several plutonium contaminated residues to Open Gradient Magnetic Separation (OGMS) on an experimental scale. Separation of graphite, bomb reduction sand, and bomb reduction sand, and bomb reduction sand, slag, and crucible, resulted in a plutonium rich fraction and a plutonium lean fraction. The lean fraction varied between about 20% to 85% of the feed bulk. The plutonium content of the lean fraction can be reduced from about 2% in the feed to the 0.1% to 0.5% range dependent on the portion of the feed rejected to this lean fraction. These values are low enough in plutonium to meet economic discard limits and be considered for direct discard. Magnetic separation of direct oxide reduction and electrorefining pyrochemical salts gave less favorable results. While a fraction very rich in plutonium could be obtained, the plutonium content of the lean fraction was to high for direct discard. This may still have chemical processing applications. OGMS experiments at low magnetic field strength on incinerator ash did give two fractions but the plutonium content of each fraction was essentially identical. Thus, no chemical processing advantage was identified for magnetic separation of this residue. The detailed results of these experiments and the implications for OGMS use in recycle plutonium processing are discussed. 4 refs., 3 figs., 9 tabs.

2204 (LA-UR–89-3503) **Preliminary integrated calculation of radionuclide cation and anion transport at Yucca Mountain using a geochemical model.** Birdsell, K.H.; Campbell, K.; Eggert, K.G.; Travis, B.J. Los Alamos National Lab., NM (USA). [1989]. 21p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-36. (CONF-890928–12: Nuclear waste isolation in the unsaturated zone: FOCUS '89, Las Vegas, NV (USA), 18-21 Sep 1989). Order Number DE90002402. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper presents preliminary transport calculations for radionuclide movement at Yucca Mountain using preliminary data for mineral distributions, retardation parameter distributions, and hypothetical recharge scenarios. These calculations are not performance assessments, but are used to study the effectiveness of the geochemical barriers at the site at mechanistic level. The preliminary calculations presented have many shortcomings and should be viewed only as a demonstration of the modeling methodology. The simulations were run with TRACRN, a finite-difference porous flow and radionuclide transport code developed for the Yucca Mountain Project. Approximately 30,000 finite-difference nodes are used to represent the unsaturated and saturated zones underlying the repository in three dimensions. Sorption ratios for the radionuclides modeled are assumed to be functions of mineralogic assemblages of the underlying rock. These transport calculations present a representative radionuclide cation, ^{135}Cs and anion, ^{99}Tc. The effects on transport of many of the processes thought to be active at Yucca Mountain may be examined using this approach. The model provides a method for examining the integration of flow scenarios, transport, and retardation processes as currently understood for the site. It will also form the basis for estimates of the sensitivity of transport calculations to retardation processes. 11 refs., 17 figs., 1 tab.

2205 (LBL–24805-Rev.) **Variable temperature effects on release rates of readily soluble nuclides: Revision.** Kim, C.-L.; Light, W.B.; Lee, W.W.-L.; Chambre, P.L.; Pigford, T.H. Lawrence Berkeley Lab., CA (USA). Sep 1988. 3p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC03-76SF00098. (CONF-880903–53-Rev.: Spectrum '88: international topical meeting on nuclear and hazardous waste management, Pasco, WA (USA), 11-15 Sep 1988). Order Number DE90002449. Available from NTIS, PC A02/MF A01; OSTI; INIS.

In this paper we study the effect of temperature on the release rate of readily soluble nuclides, as affected by a time-temperature dependent diffusion coefficient. In this analysis ground water fills the voids in the waste package at t = 0 and one percent of the inventories of cesium and iodine are immediately dissolved into the void water. Mass transfer resistance of partly failed container and cladding is conservatively neglected. The nuclides move through the void space into the surrounding rock under a concentration gradient. We use an analytic solution to compute the nuclide concentration in the gap or void, and the mass flux rate into the porous rock. 8 refs., 4 figs.

2206 (LBL–26703) **Mass transport in salt repositories: Transient diffusion into interbeds.** Hwang, Y.; Lee, W.W.-L.; Chambre, P.L.; Pigford, T.H. Lawrence Berkeley Lab., CA (USA). May 1989. 20p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC03-76SF00098. (UCB-NE–4137). Order Number DE90003299. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

To estimate possible radioactive releases from a waste package to the near-field environment, we analyzed pressure-driven brine migration movement and release rates of low-solubility and readily soluble nuclides by diffusion. A possible pathway for radioactive release in salt repositories in interbeds and we have analyzed the steady-state transport of species through the interbeds in which there is ground-water flow. A more realistic situation is when there is no ground-water flow in the interbeds. Here we use some results previously obtained for transient diffusion of radioactive species from a waste cylinder intersecting a planar fracture in rock to the problem of diffusion from a waste cylinder intersecting an interbed in a salt repository. 5 refs., 8 figs., 3 tabs.

2207 (LBL–26704) **Mass transport in salt repositories: Steady-state transport through interbeds.** Hwang, Y.; Lee, W.W.-L.; Chambre, P.L.; Pigford, T.H. Lawrence Berkeley Lab., CA (USA). Mar 1989. 13p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC03-76SF00098. (UCB-NE–4136). Order Number DE90003294. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Salt has long been a candidate for geologic disposal of nuclear waste. Because salt is extremely soluble in water, the existence of rock salt in the ground atest to the long-term stability of the salt. Both bedded salt and salt domes have been considered for nuclear waste disposal in the United States and Europe. While the salt is known to be quite pure in salt domes, bedded salt is interlaced with beds of sediments. Traditionally rock salt has not been considered water-conducting, but sediments layers would be classical porous media, capable of conducting water. Therefore there is interest in determining whether interbeds in bedded salt constitute pathway for radionuclide migration. In this report we consider steady-state migration of radionuclides from a single waste cylinder into a single interbed. Two approaches are used. In 1982 Neretnieks proposed an approach for calculating the steady-state transport of oxidants to a copper container. We have adapted that approach for calculating steady-state radionuclide migration away from the waste package, as a first approximation. We have also analyzed the problem of time-dependent radionuclide diffusion from a container through a backfill layer into a fracture, and we used the steady-state solution from that problem for comparison. Section 2 gives a brief summary of the geology of interbeds in bedded salt. Section 3 presents the mass transfer resistances approach of Neretnieks, summarizing the formulation and giving numerical illustrations of the steady-state two-dimensional diffusion analysis. Section 4 gives a brief statement of the steady-state result from a related analysis. Conclusions are stated in Section 5. 13 refs., 5 figs., 2 tabs.

2208 (LBL–26780) **Geotechnical support and topical studies for nuclear waste geologic repositories: Annual report, fiscal year 1988.** Lawrence Berkeley Lab., CA (USA). Jan 1989. 177p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC03-76SF00098. Order Number DE90002614. Available from NTIS, PC A09/MF A01; OSTI; INIS; GPO Dep.

The present report lists the technical reviews and comments made during the fiscal year 1988 and summarizes the technical progress of the topical studies. In the area of technical assistance, there were numerous activities detailed in the next section. These included 24 geotechnical support activities, including reviews of 6 Study Plans (SP) and participation in 6 SP Review Workshops, review of one whole document Site Characterization Plan (SCP) and participation in the Assembled Document SCP Review Workshops by 6 LBL reviewers; the hosting of a DOE program review, the rewriting of the project statement of work, 2 trips to technical and planning meetings; preparation of proposed work statements for two new topics for DOE, and 5 instances of technical assistance to DOE. These activities are described in a Table in the following section entitled "Geoscience Technical Support for Nuclear Waste Geologic Repositories."

2209 (LBL–26827) **Analytical models for C-14 transport in a partially saturated, fractured, porous media.** Light, W.B.; Pigford, T.H.; Chambre, P.L.; Lee, W.W.-L. Lawrence Berkeley Lab., CA (USA). Feb 1989. 9p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC03-76SF00098. (CONF-890928–16: Nuclear waste isolation in the unsaturated zone: FOCUS '89, Las Vegas, NV (USA), 18-21 Sep 1989). Order Number DE90003079. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Interaction between fractures and rock matrix is considered in developing a criterion for treating fractured rock as a porous medium for the purpose of transport calculations. The value of a modified Peclet number determines the suitability of the equivalent porous medium approach. Using a porous medium mode, underground concentrations of $^{14}CO_2$ are predicted for the proposed nuclear waste repository at Yucca Mountain, Nevada. Maximum concentrations near the ground surface are comparable to the USNRC limit for unrestricted areas; travel times are predicted to be hundreds to thousands of years for the assumed parameter values. 8 refs., 7 figs.

2210 (LBL–26828) **Release rates of soluble species at Yucca Mountain.** Lee, W.W.-L.; Pigford, T.H. Lawrence Berkeley Lab., CA (USA). Feb 1989. 7p. Sponsored by U.S. DOE Radioactive

Waste Management. DOE Contract AC03-76SF00098. (CONF-890928–15: Nuclear waste isolation in the unsaturated zone: FOCUS '89, Las Vegas, NV (USA), 18-21 Sep 1989). Order Number DE90003267. Available from NTIS, PC A02/MF A01; OSTI; INIS.

Experimental leaching of spent fuel shows that some fission product species are preferentially released upon contact with water. We analyze the conservative case of bare spent fuel in contact with saturated tuff using diffusional mass transfer analysis. For the parameter values used, the USNRC release rate limit is not exceeded, except for ^{99}Tc. The presence of a container and the distribution of water contact over time will assist in meeting this criterion. 6 figs., 2 tabs.

2211 (LBL–27225) **Gas flow in and out of a nuclear waste container.** Zwahlen, E.D.; Pigford, T.H.; Chambre, P.L.; Lee, W.W.L. Lawrence Berkeley Lab., CA (USA). May 1989. 4p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC03-76SF00098. (CONF-891103–45: Winter meeting of the American Nuclear Society, San Francisco, CA (USA), 26-30 Nov 1989; UCB-NE–4149). Order Number DE90003081. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

We analyze the flow of gases out of and into a high-level-waste container in the unsaturated tuff of Yucca Mountain. Containers are expected to fail eventually by localized cracks and penetrations. Even though the penetrations may be small, argon gas initially in the hot container can leak out. As the waste package cools, the pressure inside the container can become less than atmospheric, and air can leak in. ^{14}C released from the hot fuel-cladding surface can leak out of penetrations, and air inleakage can mobilize additional ^{14}C and other volatile radioactive species as it oxidizes the fuel cladding and the spent fuel. In an earlier paper we studied the gas flow through container penetrations occurring at the time of emplacement. Here we analyze the flow of gas for various penetration sizes occurring at 300 years. 3 refs., 2 figs.

2212 (LBL–27429) **Analytic solution of pseudocolloid migration in fractured rock.** Hwang, Y.; Pigford, T.H.; Lee, W.W.L.; Chambre, P.L. Lawrence Berkeley Lab., CA (USA). Jun 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (UCB-NE–4156;CONF-891103–41: Winter meeting of the American Nuclear Society, San Francisco, CA (USA), 26-30 Nov 1989). Order Number DE90002684. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A form of colloid migration that can enhance or retard the migration of a dissolved contaminant in ground water is the sorption of the contaminant on the moving colloidal particulate to form pseudocolloids. In this paper we develop analytical solutions for the interactive migration of radioactive species dissolved in ground water and sorbed as pseudocolloids. The solute and pseudocolloids are assumed to undergo advection and dispersion in a one-dimensional flow field in planar fractures in porous rock. Interaction between pseudocolloid and dissolved species is described by equilibrium sorption. Sorbed species on the pseudocolloids undergo radioactive decay, and pseudocolloids can sorb on fracture surfaces and sediments. Filtration is neglected. The solute can decay and sorb on pseudocolloids, on the fracture surfaces, and on sediments and can diffuse into the porous rock matrix. 1 fig.

2213 (NUREG–1351) **Standard Review Plan for a petition for rulemaking on radioactive waste streams below regulatory concern: Expedited review in accordance with Appendix B to 10 CFR, Part 2: Data report for comment.** Larkins, P.M. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Low-Level Waste Management and Decommissioning. Oct 1989. 176p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A09/MF A01 - GPO; OSTI; INIS.

The Standard Review Plan (SRP) provides guidance to staff reviewers acting on rulemaking petitions in an expeditious manner to exempt from regulation radioactive waste determined to be Below Regulatory Concern (BRC), as called for in the Low-Level Radioactive Waste Policy Amendments Act of 1985. The review plan is designed to ensure the quality and uniformity of staff reviews and to present a well-defined basis for the staff's evaluation of BRC petitions. The plan serves to improve the understanding of the staff's review by interested members of the public and the industry. It also provides information about the BRC rulemaking process to a wider audience. 6 refs., 7 figs.

2214 (NUREG/CP–0103) **Workshop on cement stabilization of low-level radioactive waste: Proceedings.** Nuclear Regulatory Commission, Washington, DC (USA); National Inst. of Standards and Technology (NCTL), Gaithersburg, MD (USA). Oct 1989. 232p. Sponsored by Nuclear Regulatory Commission. (NISTIR–89-4178;CONF-8905152–: Workshop on cement stabilization of low-level radioactive waste, Gaithersburg, MD (USA), 31 May - 2 jun 1989). Available from NTIS, PC A11/MF A01 - GPO; OSTI; INIS.

The Workshop on Cement Stabilization of Low-Level Radioactive Waste was co-sponsored by the US Nuclear Regulatory Commission and National Institute of Standards and Technology and held in Gaithersburg, Maryland on May 31–June 2, 1989. The workshop provided a forum for exchanging information on the solidification and stabilization of low-level radioactive waste in cement among federal and state regulators, nuclear power station operators, cement vendors, national laboratory researchers and consultants. The workshop was structured into a "Plenary" and four "Working Group" sessions. Each working group session discussed a set of specific issues as follows: Working Group 1, "Lessons Learned from Small- and Full-Scale Waste Forms and Observations at Nuclear Power Stations", Working Group 2, "Laboratory Test Experience and Application to Problem Waste Streams", Working Group 3, "Stabilized Waste Form Testing Guidance", and Working Group 4, "Waste Characterization, Solidification, and Process Control Programs (PCP)."

2215 (NUREG/CR–5430-Vol.1) **FLAC (Fast Lagrangian Analysis of Continua) Version 2.20: Software summary: Volume 1.** Board, M. Nuclear Regulatory Commission, Washington, DC (USA). Div. of High-Level Waste Management; Itasca Consulting Group, Inc., Minneapolis, MN (USA). Oct 1989. 175p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A08/MF A01 - GPO; OSTI; INIS.

FLAC (Fast Lagrangian Analysis of Continua), Version 2.20, is a two-dimensional, large-strain, explicit finite difference code written for analysis of problems in geotechnical engineering. FLAC has the ability to perform static mechanical analyses as well as transient heat transfer and fluid flow simulations. Various constitutive models are available to describe linear and non-linear response of the solid. Coupling can be performed between the thermal and mechanical, as well as the fluid and mechanical, models. This report presents the documentation specified in NUREG-0856, Documentation of Computer Codes for High Level Waste Management. The documentation is presented in three volumes. This document, Volume 3, presents FLAC verification, example and benchmark problems.

2216 (NUREG/CR–5430-Vol.2) **FLAC (Fast Lagrangian Analysis of Continua), Version 2.20: User's manual.** Board, M. Nuclear Regulatory Commission, Washington, DC (USA). Div. of High-Level Waste Management; Itasca Consulting Group, Inc., Minneapolis, MN (USA). Oct 1989. 506p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A22/MF A01 - GPO; OSTI; INIS.

FLAC (Fast Lagrangian Analysis of Continua), Version 2.20, is a two-dimensional, large-strain, explicit finite difference code written for analysis of problems in geotechnical engineering. FLAC has the ability to perform static mechanical analyses as well as transient heat transfer and fluid flow simulations. Various constitutive models are available to describe linear and non-linear response of the solid. Coupling can be performed between the thermal and mechanical, as well as the fluid and mechanical, models. The following report presents the documentation specified in NUREG-0856, Documentation of Computer Codes for High Level Waste Management. The documentation is presented in three volumes. Volume 1 contains the mathematical basis for the various aspects of the code; Volume 2 is the code User's Manual, and Volume 3 presents FLAC verification, example and benchmark problems. 5 refs., 81 figs., 3 tabs.

2217 (NUREG/CR–5430-Vol.3) **FLAC (Fast Lagrangian Analysis of Continua) Version 2.20: Verification, example and benchmark problems: Volume 3.** Board, M. Nuclear Regulatory Commission, Washington, DC (USA). Div. of High-Level Waste Management; Itasca Consulting Group, Inc., Minneapolis, MN

(USA). Oct 1989. 279p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A13/MF A01 - GPO; OSTI; INIS.

2218 (NUREG/CR–5441) **Soil physical properties at the Las Cruces trench site.** Wierenga, P.J.; Toorman, A.F.; Hudson, D.B.; Vinson, J.; Nash, M.; Hills, R.G. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Arizona Univ., Tucson, AZ (USA). Dept. of Soils, Water and Engineering; New Mexico State Univ., Las Cruces, NM (USA). Nov 1989. 92p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A05/MF A01 - GPO; OSTI; INIS.

Computer modelling has become an essential part of the licensing process of low level waste disposal sites. Validation of models requires high quality data from carefully controlled field experiments. This report provides the soil physical data obtained at a field site near Las Cruces, New Mexico. A large trench was constructed in undisturbed soil to provide horizontal access to irrigated plots on the sides of the trench and to provide soil samples. Details are provided on the construction of the trench and on the physical properties of the samples collected during construction of the trench. A total of 594 disturbed samples and 594 core samples were collected. Morphological characteristics of the soil at the site are presented, as well as data on the saturated hydraulic conductivity determined in the field with the bore hole permeameter and in the laboratory with a constant head method. Soil water retention data, particle size distribution data, and bulk density data are also provided. The van Genuchten equation was fitted to the soil water retention data and the parameters fitted in this equation are presented in the report. All results are presented in tabular form, ASCII format on a floppy disk available at the Nuclear Energy Software Center (NESC) Argonne National Laboratory. 3 figs., 51 tabs.

2219 (NUREG/CR–5466) **Service life of concrete.** Clifton, J.R.; Knab, L.I. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; National Inst. of Standards and Technology, Gaithersburg, MD (USA). Nov 1989. 98p. Sponsored by Nuclear Regulatory Commission. (NISTIR–89-4086). Available from NTIS, PC A05/MF A01 - GPO; OSTI; INIS.

The US Nuclear Regulatory Commission (NRC) has the responsibility for developing a strategy for the disposal of low-level radioactive waste (LLW). An approach being considered for their disposal is to place the waste forms in concrete vaults buried in the earth. A service life of 500 years is required for the concrete vaults as they may be left unattended for much of their lives. This report examines the basis for making service life predictions based on accelerated testing and mathematical modeling of factors controlling the durability of concrete buried in the ground. Degradation processes are analyzed based on considerations of their occurrence, extent of potential damage, and mechanisms. A recommended research plan for developing methods for predicting the service life of concrete is presented. The major degradation processes that concrete of underground vaults will likely encounter are sulfate attack, corrosion of reinforcing steel, alkali-aggregate reactions, and leaching by ground water. Freezing and thawing damage could occur before the vaults are covered with soil and therefore are addressed. Other degradation processes which may occur are microbiological attack, salt crystallization, and attack by LLW, especially by acidic materials. Two important factors controlling the resistance of concrete to these degradation processes are its quality and permeability. Concepts of quality and factors affecting quality of concrete are discussed. Permeability is discussed in terms of the water-to-cement ratio, the pore structure of concrete, and the effects of cracks. 101 refs., 15 figs., 5 tabs.

2220 (ORNL/FTR–3457) **[Immobilization of technetium in blast furnace slag]: Foreign trip report, October 13, 1989–October 30, 1989.** McDaniel, E.W. Oak Ridge National Lab., TN (USA). 14 Nov 1989. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE90002921. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler participated in a TRU technical specialist workshop at Mito, Japan, in accordance with the US/Japanese bilateral agreement on the management of TRU waste. The traveler also presented a paper entitled "Immobilization of Technetium in Blast Furnace Slag" and was a session chairman at the "Joint International Waste Management Conference." A site visit was made to Hiroshima University to inspect a wastewater treatment process for the removal of heavy metals.

2221 (PB–89-867741/XAB) **Radioactive waste storage sites: Reclamation and remedial action. January 1970-July 1989 (Citations from the NTIS data base). Report for January 1970-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 123p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning remedial-action programs to restore sites contaminated with radioactivity. Priority determination for remedial action, cleanup techniques, site surveys, site characterization and identification, environmental impacts of remedial action, technology for containment of contaminated materials, and programs and plans for eventual reclamation of existing facilities are among the topics discussed. Techniques of radioactive waste solidification, fixation, and vitrification are discussed in separate bibliographies. (Contains 203 citations fully indexed and including a title list.)

2222 (PB–89-870521/XAB) **Sol-gel processes. January 1970-September 1989 (Citations from the NTIS data base). Report for January 1970-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 91p. Available from NTISPC N01/MF N01.

Supersedes PB–88-868039.

This bibliography contains citations concerning the development and utilization of sol-gel processes and techniques. Topics include antireflective coatings, studies of sol-gel transitions, sol-gel synthesis and polymerization, sol-gel derived thin films and glasses, and sol-gel production of microspheres. Applications in nuclear waste management, nuclear-fuel manufacturing, glass optical waveguide development, and solar-energy collection are presented. (This updated bibliography contains 179 citations, 39 of which are new entries to the previous edition.)

2223 (PNCT-N–8410-89-008) **Plutonium diffusivity in compacted bentonite.** Idemitsu, Kazuya; Ishiguro, Katsuhiko; Yusa, Yasuhisa; Sasaki, Noriaki; Tsunoda, Naomi. Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan). Feb 1989. 15p. (CONF-8810441–: Workshop on artificial clay barriers for high level radioactive waste repositories, Lund (Sweden), 5-7 Oct 1988). Order Number DE90719555. Available from NTIS (US Sales Only), PC A03/MF A01.

Measurement on plutonium diffusivity in water-saturated compacted bentonite was carried out. Representative specimens of sodium bentonite were taken from Tsukinuno and Kuroishi mines situated in northeast Japan. Tsukinuno bentonite was divided into three types; raw type, purified Na-type, and H-type which was prepared by treating Na-type bentonite with hydrochloric acid. Kuroishi bentonite contained chlorite as impurity. H-type bentonite was used as reference for the convenience of profile measurement in bentonite, since plutonium diffusivity in H-type bentonite was considered to be larger than that in Na-type bentonite because of low pH and low swelling pressure of H-type bentonite. Sampled bentonite was compacted into pellet of 20 mm in diameter and 20 mm in height. Bulk densities of these specimens were 1200 to 1800 kg/m^3 for purified Na-type and H-type bentonite and 1600 kg/m^3 for raw type bentonite. Plutonium profiles obtained in H-type bentonite can be explained by diffusion equation with constant concentration source.

Diffusivity ranges from 10^{-13} to 10^{-12} m^2/s for H-type and Kuroishi impure sodium bentonite. Diffusivity in both raw type and purified Tsukinuno bentonite was estimated to be less than 10^{-14} m^2/s. Diffusivity in H-type bentonite showed a tendency to decrease with increasing density. Influence of quartz and hematite contents in bentonite was also studied. Quartz content up to 50% or hematite content up to 1% did not influence diffusivity significantly in H-type bentonite. The chemical species of plutonium in pore water of Na-type and H-type were estimated $Pu(OH)_3^+$ and PuO_2^+ respectively. (author).

2224 (PNCT-N–8410-89-009) **Static leaching of actinides and fission products from fully radioactive waste glass of HLLW generated in Tokai reprocessing plant.** Miyahara, K.; Ashida, T.; Yusa, Y.; Sasaki, N.; Tsunoda, N. Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan). Feb 1989. 15p. (CONF-881066–: 12. international symposium on the scientific basis for nuclear waste management, Berlin (Germany, F.R.), 10-13 Oct 1988). Order Number DE90719554. Available from NTIS (US Sales Only), PC A03/MF A01.

Fully radioactive waste glass of HLLW generated in Tokai Reprocessing Plant was produced by using a small Joule-heated ceramic melter at the Chemical Processing Facility (CPF), Tokai Works, PNC, Japan. Static leach tests using the glass were carried out in doubly distilled water for a period of up to three months at 30degC and 90degC. Gamma spectrometry was performed to measure ^{134}Cs, ^{137}Cs and ^{60}Co in the leachates. After the chemical separation of Cs isotopes in the leachates, it was newly possible to measure ^{125}Sb, ^{144}Ce, ^{154}Eu and ^{155}Eu. Alpha spectrometry was performed to measure ^{239}Pu + ^{240}Pu, ^{241}Am and ^{244}Cm in the leachates. Adsorption of the actinides on the wall of the leach vessel was recognized in all cases. Leaching behavior of the measured radionuclides were evaluated by considering mass balance of the radionuclides which were leached. (author).

2225 (PNL–7130) **Evaluation of the ground-water contaminant plume extending from the 183-H Solar Evaporation Basins.** Hall, S.H. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 29p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC06-76RL01830. Order Number DE90003091. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The 183-H Solar Evaporation Basins, located on the Hanford Site in southeastern Washington State, were used for solar concentration and storage of process wastes that consisted of nitric, sulfuric, and hydrofluoric acids, contaminated by heavy metals and radionuclides, and neutralized by sodium hydroxide. By 1977, it was apparent that leakage from the basins had reached the unconfined aquifer, causing elevated ground-water concentrations of nitrate, chromium, technetium-99, and uranium. The resulting plume is superimposed on a larger, pre-existing plume from upgradient sources that is characterized by the same contaminants, but with different relative concentrations. The plumes discharge into the Columbia River, 210 m from the basins. This study examines the relative concentration ratios of the contaminants, determines which wells in the monitoring network surrounding the basins have been affected by basin leakage, assigns reasonable plume boundaries, and shows the separate contribution of each plume to ground-water contamination downgradient from the basins. 10 refs., 8 figs., 4 tabs.

2226 (PNL-SA–16209) **Slurry-fed ceramic melter–A broadly accepted system to vitrify high-level waste.** Chapman, C.C.; McElroy, J.L. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 10p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891006–8: Joint international waste management conference, Kyoto (Japan), 23-28 Oct 1989). Order Number DE90002500. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Slurry (or liquid)-fed ceramic melters (LFCM) have been chosen for vitrifying liquid high-level radioactive waste (HLW) in projects around the world: three in the US, two in Japan, one in West Germany, and one in Belgium. This paper summarizes the experience with this technology, which has proven adaptable to the broadcast spectrum of wastes and throughputs. The generic technical issues of process and product requirements are reviewed, including differences among wastes and their processing challenges, such as throughput, elemental solubilities, corrosiveness, and preferred methods. In the US, waste-form qualification is currently the most critical issue needing acceptance before approval is received for startup of a vitrification plant. Product requirements as defined in the US waste acceptance specifications are translated into operational and technological requirements. Among these are sampling requirements, which are minimized using the LFCM process.

2227 (PNL-SA–16734) **A sensitivity study of near-field thermomechanical conditions in tuff.** Johnson, K.I.; Voss, C.F.; Sherwood, D.J. Pacific Northwest Lab., Richland, WA (USA). Aug 1989. 11p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC06-76RL01830. (CONF-890928–14: Nuclear waste isolation in the unsaturated zone: FOCUS '89, Las Vegas, NV (USA), 18-21 Sep 1989). Order Number DE90002663. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A study was conducted by the Pacific Northwest Laboratory to investigate the response of a discontinuous rock mass to the combined mechanical and thermal loads from the excavation of repository openings and decay heating of radioactive waste forms. The ANSYS finite element code was used to calculate temperatures and thermal stresses near an emplacement hole as a function of time. The UDEC distinct element code was used to simulate a discontinuous rock mass around the emplacement hole using the finite element stress results as boundary conditions. This approach differs from previous work in its approximation of the near-field geosphere as an assemblage of blocks that are free to slide and rotate relative to one another. The physical properties of the rock joints and fractures were explicitly included in the analysis. Earlier efforts have used continuum models that included the effects of discontinuities by adjusting material properties (reducing elastic modulus and rock strength) or using ubiquitous joints. A range of parameter values were used to represent the upper, lower, and expected conditions for the Yucca Mountain site. Assuming worst case conditions, the calculated displacements around the emplacement hole were only a small fraction of the design air gap between the waste package and the wall of the emplacement hole. Overall, the results confirm that the retrieval option and waste package lifetime will not be adversely affected by borehole instability and excessive rock loads. 8 refs., 6 figs., 4 tabs.

2228 (PNL-SA–16826) **Applicable or relevant and appropriate requirements (ARARs) for radioactive mixed waste.** Keller, J.F.; Woodruff, M.G. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891072–6: 27. Hanford symposium on health and the environment: multilevel research–molecules to man, Richland, WA (USA), 18-20 Oct 1989). Order Number DE90001900. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Radioactive mixed waste (RMW) refers to waste containing both chemicals and radionuclides. Sites that contain such wastes are subject to a complex regulatory framework. Currently, no single statute or regulation addresses all aspects of RMW management and cleanup. This paper reviews the federal environmental pollution control and radioactive waste management statutes and regulations that may contain applicable or relevant and appropriate requirements (ARARs) as defined under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Potential ARARs for the air, groundwater, surface water, soil, and overall exposure pathways are identified. Additional regulatory documents that contain potential standards are also identified. These requirements can be used in determining appropriate cleanup levels (or targets) for an RMW site. 19 figs., 6 tabs.

2229 (PNL-SA–16844) **Use of the Multimedia Environmental Pollutant Assessment System (MEPAS) for large- and small-scale applications.** Buck, J.W.; Aiken, R.J. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 10p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. (CONF-890964–1: 4. annual hazardous waste and hazardous materials management conference and exposition, San Francisco, CA (USA), 27-29 Sep 1989). Order Number DE90001898. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Multimedia Environmental Pollutant Assessment System (MEPAS) is an objective, physics-based computer code system that

provides a means of quantifying relative risks from contaminants released into the environment. A baseline survey of DOE's major operating facilities is being conducted to identify and rank environmental problems and areas of environmental risk. The MEPAS model was used on 208 groups of problems associated with 16 sites located in 12 different states. Within 1 year, 208 groups of problems and some 500 transport scenarios were assembled, data were input, and model runs were made and analyzed. Findings from the surveys conducted at the 16 DOE sites were used to identify preliminary environmental problems. Using the MEPAS methodology as a basis for the ranking, these environmental problems are being ranked according to relative potential public health and environmental impact. The resulting Hazard Potential Index (HPI) is used to develop a preliminary ranking for each of the environmental problems. As a part of the Environmental Survey, DOE has issued a preliminary summary report that includes a preliminary ranking of potential problems at 16 sites associated with DOE's defense production mission. A final summary report addressing all 35 of the major DOE sites will re-evaluate the preliminary ranking and will incorporates the results of the Survey's sampling and analysis. 6 refs.

2230 (PNL-SA–17164-HEDR) **The identification of terrain-induced circulations using principal components.** Skyllingstad, E.D.; Schwartz, M.N. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-8910277–1: 11. conference of probability and statistics, Monterey, CA (USA), 1-5 Oct 1989). Order Number DE90001991. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The application of principal component analysis to regional wind fields can provide an objective method for the identification of synoptic, thermal, and topographical effects. These results can be applied to regional wind forecasting by providing a frequency distribution for various wind-field transitions from the current observed state or used in defining climatological wind fields for air quality studies. In future work, a principal component analysis of large-scale forcing will be combined with the regional wind-field study to provide a more objective link between synoptic and mesoscale patterns. Synoptic-scale situations from operational meteorological models could then be used to predict changes in the local wind field. 8 refs., 2 figs., 2 tabs.

2231 (PNL-SA–17267) **Recommendations for evaluating environmental monitoring programs for alternative low-level waste facilities.** Denham, D.H. Pacific Northwest Lab., Richland, WA (USA). Aug 1989. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-890854–14: 11. annual DOE low level waste management conference, Pittsburgh, PA (USA), 22-24 Aug 1989). Order Number DE90002733. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Licensing of low-level radioactive waste disposal facilities requires the review of the proposed environmental monitoring and surveillance programs, which is why the US Nuclear Regulatory Commission (NRC) Division of Low-Level Waste Management and Decommissioning has developed a draft Branch Technical Position paper, "Environmental Monitoring of Low-Level Radioactive Waste Disposal Facilities." In support of these program reviews, Pacific Northwest Laboratory prepared recommendations for NRC staff to use in evaluating the adequacy of proposed environmental monitoring programs during the preoperational, operational, and postoperational phases of low-level waste facility operations. These recommendations are documented in an NRC-sponsored report that includes review checklists for NRC staff to use in evaluating environmental monitoring and surveillance program compliance with applicable regulations, including both radiological and selected nonradiological parameters. The criteria applied to establish these review checklists were based on requirements established in the US Code of Federal Regulations. 28 refs.

2232 (PNL-SA–17359) **Trends in radionuclide concentrations for wildlife and food products near Hanford for the period 1971 through 1988.** Eberhardt, L.E.; Cadwell, L.L.; Price, K.R.; Carlile, D.W. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 17p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891053–7: 28. Hanford life sciences symposium on environmental monitoring, restoration and assessment: what have we learned?, Richland, WA (USA), 16-19 Oct 1989). Order Number DE90002673. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The objective of this summary investigation was to identify trends in radionuclide concentrations for wildlife and food products sampled from 1971 through 1988 as part of the Hanford Site Environmental Monitoring Program. No upward trends in radionuclide concentrations were detected for any wildlife or food products. Several sample types demonstrated significantly declining radionuclide concentrations. Three factors appeared to be responsible for the trends. First, the cessation of atmospheric testing by the United States and Soviet Union in 1971 contributed to the decline of radionuclides in some samples. Second, contaminants discharged to the Columbia River were reduced subsequent to the 1971 shutdown of the last Hanford nuclear reactor that used a once-through cooling water design. The reactor closing resulted in declines in activation products in oysters from Willapa Bay and in whitefish from the Hanford Reach of the Columbia River. Third, reductions in radionuclide concentrations in Hanford wildlife suggested a decreasing availability of environmental contaminants to wildlife. Remediation of areas having environmental surface contaminants on the Hanford Site was identified as a probable cause. 5 refs., 4 figs., 2 tabs.

2233 (SAND–88-2535) **Approach to first principles model prediction of measured WIPP [Waste Isolation Pilot Plant] in situ room closure in salt.** Munson, D.E.; Fossum, A.F.; Senseny, P.E. Sandia National Labs., Albuquerque, NM (USA). Aug 1989. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890628–4: 30. US symposium on rock mechanics, Morgantown, WV (USA), 19-22 Jun 1989). Order Number DE90002089. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The discrepancies between predicted and measured WIPP in situ Room D closures are markedly reduced through the use of a Tresca flow potential, an improved small strain constitutive model, an improved set of material parameters, and a modified stratigraphy. 12 refs., 5 figs., 1 tab.

2234 (SAND–88-2626C) **Predicting flow through low-permeability, partially saturated, fractured rock: A review of modeling and experimental efforts at Yucca Mountain.** Eaton, R.R.; Bixler, N.E.; Glass, R.J. Sandia National Labs., Albuquerque, NM (USA). [1989]. 39p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. (CONF-890702–4: 28. international geological congress, Washington, DC (USA), 9-19 Jul 1989). Order Number DE90002884. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Current interest in storing high-level nuclear waste in underground repositories has resulted in an increased effort to understand the physics of water flow through low-permeability rock. The US Department of Energy is investigating a prospective repository site located in volcanic ash (tuff) hundreds of meters above the water table at Yucca Mountain, Nevada. Consequently, mathematical models and experimental procedures are being developed to provide a better understanding of the hydrology of this low-permeability, partially saturated, fractured rock. Modeling water flow in the vadose zone in soils and in relatively permeable rocks such as sandstone has received considerable attention for many years. The treatment of flow (including nonisothermal conditions) through materials such as the Yucca Mountain tuffs, however, has not received the same level of attention, primarily because it is outside the domain of agricultural and petroleum technology. This paper reviews the status of modeling and experimentation currently being used to understand and predict water flow at the proposed repository site. Several areas of research needs emphasized by the review are outlined. The extremely nonlinear hydraulic properties of these tuffs in combination with their heterogeneous nature makes it a challenging and unique problem from a computational and experimental view point. 101 refs., 14 figs., 1 tab.

2235 (SAND–88-2734) **3D thermal stress analysis of WIPP [Waste Isolation Pilot Plant] Room T RH TRU [Remote Handled Transuranic] experiments.** Argueello, J.G.; Beraun, R.; Molecke, M.A. Sandia National Labs., Albuquerque, NM (USA). Aug 1989. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract

AC04-76DP00789. (CONF-890628–1: 30. US symposium on rock mechanics, Morgantown, WV (USA), 19-22 Jun 1989). Order Number DE90001883. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A three-dimensional finite element thermal stress analysis of the RH TRU experiments in WIPP Room T has been performed. This analysis aids in the interpretation of the borehole closure results being obtained from the Room T experiments and helps in assessing potential performance impacts in a typical storage room, during the waste retrieval period. Computed results are presented and compared to available in situ data, and a qualitative agreement between measured and computed closures is seen. 9 refs., 10 figs.

2236 (SAND–89-0386) **The Waste Isolation Pilot Plant (WIPP) Seal System Performance Program.** Nowak, E.J.; Tyler, L.D. Sandia National Labs., Albuquerque, NM (USA). Aug 1989. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8905136–3: Joint NEA/CEC workshop on sealing of radioactive waste repositories, Braunschweig (Germany, F.R.), 22-25 May 1989). Order Number DE90001885. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) Seal System Performance Program addresses the sealing of all manmade penetrations. Sealing concepts for shafts, drifts, and boreholes have been developed, and candidate seal materials were identified. Ongoing laboratory tests and model calculations have confirmed the potential effectiveness of reconsolidated WIPP crushed salt as a primary long-term seal material. Grouts based on crushed WIPP salt appear to be viable materials for sealing anhydritic interbeds at drift and panel seal locations. In situ tests have demonstrated the viability of concrete bulkheads as temporary seal materials that preserve the integrity of the seal system until the crushed salt components have reconsolidated sufficiently. Cementitious grouts have also been tested in WIPP boreholes drilled from the surface. Scaled in situ tests of crushed salt and bentonite (as a temporary seal material to prevent downflow of water into the crushed salt in shafts) are currently underway. Large scale seal tests and the development of models that predict the performance of seal systems are being developed from the test data. 13 refs., 6 figs.

2237 (UCRL–98308) **Application of the results of excavation response experiments at climax and the Colorado School of Mines to the development of an experiment for the underground research laboratory.** Ubbes, W.F.; Yow, J.L. Jr.; Hustrulid, W.A. Lawrence Livermore National Lab., CA (USA). 29 Apr 1988. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8804309–1: Organization for Economic Cooperation and Development/Nuclear Energy Agency Excavation Response workshop, Winnipeg (Canada), 29 Apr 1988). Order Number DE90002976. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Large-scale underground experiment programs to examine excavation response have been performed at the Climax facility in Nevada and at the Colorado School of Mines. These two programs provided fundamental information on the behavior of rock and the effects of excavation; on instrument performance and configuration; and on the relationship between test geometry and test behavior. This information is being considered in the development of a major excavation response experiment to be carried out in the Canadian Underground Research Laboratory. 11 refs., 3 figs.

2238 (UCRL–98729) **The EQ3/6 software package for geochemical modeling: Current status.** Worlery, T.J.; Jackson, K.J.; Bourcier, W.L.; Bruton, C.J.; Viani, B.E.; Knauss, K.G.; Delany, J.M. Lawrence Livermore National Lab., CA (USA). Jul 1988. 16p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. (CONF-880912–32: 196. American Chemical Society national meeting, Los Angeles, CA (USA), 25-30 Sep 1988). Order Number DE90002820. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

EQ3/6 is a software package for modeling chemical and mineralogic interactions in aqueous geochemical systems. The major components of the package are EQ3NR (a speciation-solubility code), EQ6 (a reaction path code), EQLIB (a supporting library), and a supporting thermodynamic data base. EQ3NR calculates aqueous speciation and saturation indices from analytical data. It can also be used to calculate compositions of buffer solutions for use in laboratory experiments. EQ6 computes reaction path models of both equilibrium step processes and kinetic reaction processes. These models can be computed for closed systems and relatively simple open systems. EQ3/6 is useful in making purely theoretical calculations, in designing, interpreting, and extrapolating laboratory experiments, and in testing and developing submodels and supporting data used in these codes. The thermodynamic data base supports calculations over the range 0-300°C. 60 refs., 2 figs.

2239 (UCRL–100603) **Evaluation of the post-emplacement environment of high level radioactive waste packages at Yucca Mountain, Nevada.** Glassley, W. Lawrence Livermore National Lab., CA (USA). Mar 1989. 16p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. (CONF-8903112–5: Waste management '89, Tucson, AZ (USA), 1 Mar 1989). Order Number DE90002816. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Evaluation of the post-emplacement environment around high level radioactive waste containers is required by federal regulations. The information derived from this evaluation will be used to determine the service performance of the waste containers, the chemical and hydrological conditions that may influence radionuclide release and transport if containers are breached, and retrievability of the waste containers prior to closure of the repository. Laboratory studies, numerical simulations, and field experiments and tests are used to provide data necessary for this evaluation. Results obtained to date demonstrate that the post-emplacement environment in the welded tuff at Yucca Mountain, Nevada maintains relatively benign chemical features (i.e., near neutral pH, low concentrations of dissolved species) for most scenarios. The hydrological environment appears to be one of low flow volume and rates for the expected condition of an unsaturated medium. Emplacement borehole stability will be a function of fracture density and orientation, which may be influenced by microcrack development. Field studies and numerical simulations are in progress that will extend the results of laboratory studies to long time periods. The extent to which chemical, hydrological and mechanical processes can be adequately coupled through numerical simulations remains a matter of concern. 18 refs., 4 figs., 1 tab.

2240 (UCRL–101285) **A kinetic model for dissolution of borosilicate glass.** Bourcier, W.L.; Knauss, K.G.; Merzbacher, C.I. Lawrence Livermore National Lab., CA (USA). 28 Sep 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-890867–3: 6. international symposium on water-rock interaction, Malvern (UK), 3-9 Aug 1989). Order Number DE90002817. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A kinetic model for the dissolution of borosilicate glass, incorporated into the EQ3/6 geochemical modeling code, is used to predict the dissolution rate of a nuclear waste glass. The glass dissolution rate is controlled by the rate of dissolution of an alkali-depleted amorphous surface gel layer. The good agreement between predicted and observed dissolution behavior suggests that the experimentally obtained non-linear glass release rates are not diffusion controlled, as previously believed, but are instead controlled by dissolution affinity. The model predicts that the long-term rate of glass dissolution will depend mainly on ion concentrations in solution, and therefore the secondary phased which precipitate and control ion concentrations. 4 refs., 5 figs., 1 tab.

2241 (NRPB-R–225) **Investigations of Iodine-129 in the natural environment: results and implications.** Wilkins, B.T. National Radiological Protection Board, Chilton (UK). Jun 1989. 23p. Available from H.M. Stationery Office, London, price Pound 4.00.

The distribution of iodine-129 in the terrestrial environment in west Cumbria is dominated by the continuous discharges from the

Sellafield plant to atmosphere. Although most of the iodine-129 discharged goes to sea, there is no evidence that sea-to-land transfer is significant for this radionuclide. An assessment of activity concentrations in foodstuffs confirms that consumption of cows' milk is the most important contributor to intake and shows the resultant committed effective dose equivalent is less than 0.5% of the present international dose limit, which for continuous exposure over a lifetime is 1 mSv y^{-1}. Transfer from feed to cows's milk has been followed during open pasture grazing in the summer and during the winter when the cows consume locally-produced silage. In both cases, transfer coefficients from feed to milk were lower than the consensus value currently employed for modelling purposes, but consistent with values derived more recently under a variety of field conditions. (author).

2242 (DOE/OR/21548–045-Rev.0) **Phase 1 spring and seep report: Weldon Spring Site Remedial Action Project, Weldon Spring, Missouri: Revision 0.** MK-Ferguson Co., St. Charles, MO (USA); Jacobs Engineering Group, Inc., St. Charles, MO (USA). Aug 1989. 74p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-86OR21548. Order Number DE90002280. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

Pursuant to the overall objective of the WSSRAP to characterize the potential environmental and health impacts posed by the Weldon Spring Site, the Phase I Spring and Seep sampling effort was undertaken to evaluate the migration of site-related contaminants through conduit type groundwater flow. Samples were collected from springs during both high and low flow stages. Samples were analyzed for uranium, nitroaromatic compounds, CLP metals, and inorganic anions. Eight of the 27 springs which were sampled in a 2 mile radius of the site were found to contain levels of contaminants above calculated background levels. This report details the rationale, sampling and analytical methodologies, the analytical results, and the interpretation of transport mechanisms for each of the positive results. 12 refs., 4 figs., 7 tabs.

2243 (PNL–6972) **Remediation of DOE hazardous waste sites: Planning and integration requirements.** Geffen, C.A.; Garrett, B.A.; Cowan, C.E.; Siegel, M.R.; Keller, J.F. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE90002513. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The US Department of Energy (DOE) is faced with a immense challenge in effectively implementing a program to mitigate and manage the environmental impacts created by current operations and from past activities at its facilities. The current regulatory framework and public interest in the environmental arena have made operating DOE facilities in an environmentally responsible manner a compelling priority. This paper provides information on the results of a project funded by DOE to obtain a better understanding of the regulatory and institutional drivers in the hazardous waste market and the costs and timeframes required for remediation activities. Few realize that before remediating a hazardous waste site, a comprehensive planning process must be conducted to characterize the nature and extent of site contamination, calculate the risk to the public, and assess the effectiveness of various remediation technologies. The US Environmental Protection Agency (EPA) and others have found that it may take up to 7 years to complete the planning process at an average cost of $1.0 million per site. While cost information is not yet available for DOE sites, discussions with hazardous waste consulting firms indicate that average characterization and assessment costs will be 5 to 10 times this amount for DOE sites. The higher costs are expected because of the additional administrative requirements placed on DOE sites, the need to handle mixed wastes, the amount and extent of contamination at many of these sites, and the visibility of the sites. 15 refs., 1 fig., 2 tabs.

2244 (PPA-T–7) **Radiation hazard from the tantalum dumps in Penang.** Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). [1989]. 26p. Order Number DE90608330. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The radiation level at the dumps are well above background. The readings taken on the dumps themselves range from 1000 mrem/year to 5860 mrem/year. The radiation levels in the houses close to the dump at Hill Railway Road were much lower, in the range of 160 mrem/year to 335 mrem/year. However, the level recorded at a house on Medan Tembaga is higher, being around 650 mrem/year. It is worth noting that the maximum permissible dose as recommended by the International Commission on Radiological Protection for the general public is 500 mrem/year and the average background radiation level is around 80-90 mrem/year. (author).

2245 (IAEA-INFCIRC–369) **Agreement of 20 September 1988 between the People's Republic of China and the International Atomic Energy Agency for the application of safeguards in China.** International Atomic Energy Agency, Vienna (Austria). Oct 1989. 33p. Order Number DE90608880. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Hard copies are available in Chinese from IAEA Div. of Publications, Distribution Unit.

The document contains two parts. The first part stipulates the agreement of China to accept IAEA safeguards on all source or special fissionable material in peaceful nuclear facilities to be designated by China within its territory with a view to enabling the Agency to verify that such material is not withdrawn, except as provided for in this Agreement, from those facilities while such material is subject to safeguards under this Agreement. The second part specifies the procedures to be applied in the implementation of the safeguards provisions of Part I.

2246 (LA-UR–89-3699) **Measurements of plutonium residues from recovery processes.** Hsue, S.-T.; Langner, D.G.; Longmire, V.L.; Menlove, H.O.; Russo, P.A.; Sprinkle, J.K. Jr. Los Alamos National Lab., NM (USA). [1989]. 13p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-36. (CONF-891197–3: Topical meeting on non-destructive assay of radioactive waste, Cadarache (France), 20-22 Nov 1989). Order Number DE90003170. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Conventional methods of nondestructive assay (NDA) have accurately assayed the plutonium content of many forms of relatively pure and homogeneous bulk items. However, physical and chemical heterogeneities and the high and variable impurity levels of many categories of processing scrap bias the conventional NDA results. The materials also present a significant challenge to the assignment of reference values to process materials for purposes of evaluating the NDA methods. A recent study using impure, heterogeneous, pyrochemical residues from americium molten salt extraction (MSE) has been aimed at evaluating NDA assay methods based on conventional gamma-ray and neutron measurement techniques and enhanced with analyses designed to address the problems of heterogeneities and impurities. The study included a significant effort to obtain reference values for the MSE spent salts used in the study. Two of the improved NDA techniques, suitable for in-line assay of plutonium in bulk, show promise for timely in-process assays for one of the most difficult pyrochemical residues generated as well as for other impure heterogeneous scrap categories. 12 refs., 4 figs., 5 tabs.

2247 **Applying AI techniques to improve alarm display effectiveness.** Gross, J.M. (Westinghouse Idaho Nuclear Co., Idaho Falls, ID (US)); Birrer, S.A.; Crosberg, D.R. pp. 910 of Artificial intelligence and other innovative computer applications in the nuclear industry. Majumdar, M.C.; Majumdar, D.; Sackett, J.I American Nuclear Society, La Grange Park, IL (1987). (CONF-870832–: Topical meeting on artificial intelligence and other innovative computer applications in the nuclear industry: present and future, Snowbird, UT (USA), 31 Aug - 2 sep 1987).

The Alarm Filtering System (AFS) addresses the problem of information overload in a control room during abnormal operations. Since

operators can miss vital information during these periods, systems which emphasize important messages are beneficial. AFS uses the artificial intelligence (AI) technique of object-oriented programming to filter and dynamically prioritize alarm messages. When an alarm's status changes, AFS determines the relative importance of that change according to the current process state. AFS bases that relative importance on relationships the newly changed alarm has with other activated alarms. Evaluations of a alarm importance take place without regard to the activation sequence of alarm signals. The United States Department of Energy has applied for a patent on the approach used in this software. The approach was originally developed by EG and G Idaho for a nuclear reactor control room.

2250 (IAERU–8802, pp. 3-27) **Neutron radiography and its image resolutions.** Kobayashi, Hisao (Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Mar 1989. (In Japanese). (CONF-8806441–: 4. IAERU seminar, Tokyo (Japan), 18 Jun 1988). In *Proceedings of IAERU seminar-4.* Order Number DE90705939. Available from NTIS (US Sales Only), PC A07/MF A01.

Neutron radiography (NR) is widely applied especially for non-destructive inspection of industrial products. An outline of NR technique is given in this report with few examples of industrial applications. The quality of a NR image depends on many factors. The values of L, D, and L/D are main factors to define a geometrical unsharpness of NR images. A device for accurate measurements of those parameters is proposed and fabricated. Degree of confidence is estimated for measurements of those parameters in detail. Values of L, D, and L/D are measured for our NR facilities with different geometrical conditions by use of the device and the values are compared to the designed values. The quality of the NR image also depends on an inherent unsharpness of its imaging device. The inherent unsharpness is measured as an edge spread function (ESF) and a modulation transfer function (MTF) is derived from the ESF with a technique of the discrete fast Fourier transform (DFFT). Results are compared to theoretically calculated MTF. (author).

2251 (IAERU–8802, pp. 29-47) **Studies and applications of neutron radiography with film methods.** Ikeda, Yasushi (Nagoya Univ. (Japan). Faculty of Engineering). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Mar 1989. (In Japanese). (CONF-8806441–: 4. IAERU seminar, Tokyo (Japan), 18 Jun 1988). In *Proceedings of IAERU seminar-4.* Order Number DE90705939. Available from NTIS (US Sales Only), PC A07/MF A01.

Neutron radiography has been studied with film methods and applied to some industrial applications. The film methods include not only conventional silver-halide emulsion films, such as industrial, medical or soft X-ray ones, but also track-etch films and those for indirect methods. The characteristics of the film methods are analyzed and investigated with using various image converters, such as gadolinium metal foil and evaporation films, or some scintillation converters such as NE426. The sensitivities and MTFs for various sets of films and converters have been obtained, which gives a chart of the correlation between the appropriate exposure and resolving powers for them. From the chart, one can select some proper sets for the purpose and given conditions of neutron radiography facilities. The film methods have been applied to inspect very fine cracks in thick steel blocks and plates. It is also applied to observe nuclear fuel pellets or irradiated nuclear fuel pins. Furthermore, the film method has been used for neutron computed tomography. Very fine Eu-particles in TiO pellets, which diameters are nearly 300 micron, can be reconstructed by the neutron CT. The fine neutron CT will be useful for the inspection of Pu-particles in mixed oxide nuclear fuel pellets for future advance nuclear reactors. (author).

2252 (IAERU–8802, pp. 49-71) **Digital image processing for real-time neutron radiography and its applications.** Fujine, Shigenori (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Mar 1989. (In Japanese). (CONF-8806441–: 4. IAERU seminar, Tokyo (Japan), 18 Jun 1988). In *Proceedings of IAERU seminar-4.* Order Number DE90705939. Available from NTIS (US Sales Only), PC A07/MF A01.

The present paper describes several digital image processing approaches for the real-time neutron radiography (neutron television-NTV), such as image integration, adaptive smoothing and image enhancement, which have beneficial effects on image improvements, and also describes how to use these techniques for applications. Details invisible in direct images of NTV are able to be revealed by digital image processing, such as reversed image, gray level correction, gray scale transformation, contoured image, subtraction technique, pseudo color display and so on. For real-time application a contouring operation and an averaging approach can also be utilized effectively. (author).

2253 (IAERU–8802, pp. 73-99) **Transportable thermal neutron radiography devices.** Wada, Nobuo (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Mar 1989. (In Japanese). (CONF-8806441–: 4. IAERU seminar, Tokyo (Japan), 18 Jun 1988). In *Proceedings of IAERU seminar-4.* Order Number DE90705939. Available from NTIS (US Sales Only), PC A07/MF A01.

A transportable exposure device equipped with a 1 mg ^{252}Cf neutron source was designed and constructed for thermal neutron radiography. It has three divergent collimators with a large outlet aperture of 200 mm in diameter. These collimators have the same length (L) of 500 mm and an inlet aperture (D) of different sizes.; 10, 20 or 40 mm in diameter. A thermal neutron flux of 3.0×10^3 cm^{-2} s^{-1} was obtained at the outlet of the collimator for L/D ratio of 25. The ratio of thermal neutron to γ-ray dose rate was 2.9×10^4 cm^{-2} mR^{-1} at the same position. It was shown that direct exposure method using the combination of a scintillation converter (NE-426)

and a fine grain film (Kodak-SR) is an appropriate choise for high quality radiographs. Track-etching method using an enriched-^{10}B converter in contact with a nitrocellulose film was also found to show an excellent image resolution in such low flux neutron imaging under high γ-ray background. In this paper, a simple neutron imaging device consisting of an image intensifier and Poraloid camera, neutron and gamma simultaneous neutron radiography technique and neutron induced alpha-ray auto-radiography technique are also described. In addition, fixed or transportable neutron radiography systems using accelerator neutron sources are presented. (author).

2254 (INIS-mf–12013, pp. 51) **Preparation of ^{60}cobalt sources by molecular plating.** Baumann, H. (Frankfurt Univ. (Germany, F.R.). Inst. fuer Kernphysik); Essig, W.; Hirning, R.; Kayser, J.; Ferber, H.; Grabisch, K.; Shamir, M.; Schuehrer, B.; Wirth, H.L. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

^{60}cobalt layers on thin self-supported carbon foils have been prepared by molecular plating. (orig.).

2255 (PPA-T–83) **Preparation methodology of radiation - curable resin. Unsaturated polyesters.** Dahlan bin Haji Mohd; Hussin bin Mohd Nor; Mohamad Hilmi bin Mahmood. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). [1989]. 23p. Order Number DE90608596. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Two types of unsaturated polyester have been prepared according to normal alkyd methods of preparation. In this work the emphasis has been given to the preparation methodology of unsaturated polyesters in styrene. Their molecule weight distributions fall between normal alkyd's i.e. 2500 to 3500. (author).

2256 (PPA-T–88) **Electron beam (EB) curing of wood surface finishing - lamination of PVC film on wood substrates. Final report STA scientist exchange program JAERI, Takasaki, Japan (September to November 1988).** Mohamad Hilmi bin Mahmood. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). Dec 1988. 17p. Order Number DE90608597. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The properties of the films formulated by using various acrylated polyesters and urethane oligomers, mono-, di- and trifunctional monomers cured by using EB machine were investigated. The processability of these formulations on wood substrates were examined and later to apply those few selected formulations as adhesives in the EB curing of lamination of PVC films on wood substrates. (author).

2257 (PPA-T–89) **Non-destructive radiometry inspection technique for locating reinforcements and void/porosity in bridge bearings.** Yahaya bin Jafar; Jaafar bin Abdullah; Mohamad Azmi bin Ismail. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). [1989]. 29p. Order Number DE90608593. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Defects detection in bridge bearings is very important in controlling quality and safety. Typical manufacturing defects include misalligned or bent steel plates and the presence of voids/porosity within the rubber. A non-destructive radiometry inspection technique was used to locate steel plates position and the presence of voids/porosity in bridge bearing samples provided by the Rubber Research Institute of Malaysia (RRIM). Preliminary studies show that the mentioned defects can readily be determined by this technique. Some of the results are also presented. (author).

2258 (EPRI-GS–6563) **Hydrogen conference: Workshop proceedings.** Serfass, J.; Bugel, L. Electric Power Research Inst., Palo Alto, CA (USA); Technology Transition Corp., Washington, DC (USA). c Oct 1989. 199p. Sponsored by Electric Power Research Institute. (CONF-8811281–: Hydrogen conference, Palo Alto, CA (USA), 16-17 Nov 1988). Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This meeting was designed to encourage discussion of today's US industrial, utility, space and environmental interests in hydrogen and tommorrow's use of hydrogen as an energy system. The meeting began with a general session during which speakers gave presentations on a variety of hydrogen topics. Discussion following each presentation was lively. Some of the major points of discussion were: interpretation of global warming evidence; relevance of global warming to the interest in hydrogen; cost of hydrogen derived from fossil fuels vs. nuclear vs. solar; likely future importance of hydrogen – major energy system vs. niche player. A number of interesting points were raised and data presented by speakers and participants. Highlights are presented.

2259 (ORNL/tr–89/42) **Horizontal cold source friction losses of D_2 model with coaxial tubes comparison of calculated values with experimental results in D_2.** Hoffmann, H. Oak Ridge National Lab., TN (USA). 1989. 34p. Translation of Re 972 N(p) 007, July 1983. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002165. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The horizontal cold source will be placed in the available H5 channel and the heat produced will be transported by natural convection from the moderator (deuterium) in a thermosiphon circuit in a saturated state (temperature 25°K). The horizontal cold source cell is supplied by the liquid moderator which partially evaporates in the cell. The vapor produced leaves the cell mixed with liquid deuterium and is liquefied in a condenser. In the case under study, the horizontal cold source cell is connected to the condenser by two tubes placed coaxially in the upper part of the cell. These tubes are mounted horizontally in the channel and behind the protective plug they rise vertically to the condenser. The fluid is single phase when it flows in the center tube towards the cell and it is diphase in the ring-shaped space going towards the condenser. 6 refs., 14 figs., 4 tabs.

2260 (SAND–89-0917) **Shock-wave characterization of energetic booster-rocket propellant WAK-2 and its simulant UGS.** Weirick, L.J. Sandia National Labs., Albuquerque, NM (USA). Oct 1989. 34p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC04-76DP00789. Order Number DE90002633. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A series of shock-loading experiments on an energetic propellant and its simulant was conducted on a light-gas gun. The purpose of this work was to characterize the shock sensitivity of WAK-2, which is a composite-modified, double-based, booster-rocket propellant and its simulant UGS. The initial objectives were to obtain Hugoniot data, to investigate the pressure threshold at which a reaction occurs, and to measure spall threshold at various impact velocities. The Hugoniot data obtained for the propellant fits the Hugoniot curve provided by the manufacturer of the propellant. A Hugoniot curve developed for the simulant was found to match that of the propellant. The initial density, ρ_0, initial bulk sound velocity, C_0, and constant S values for the energetic propellant WAK-2 and its simulant UGS were 1.85 g/cm^3, 2.2 mm/μs and 2.66, respectively. The ignition threshold pressure of the WAK-2 was found to be in the

range of 3 kbar. A violent reaction was observed for a sample impacted at a pressure of 22 kbar. In spall tests, impact pressures in the range of 1.1 to 3.1 kbar were applied to the propellant/simulant. The propellant exhibited spall strengths ~0.33 kbar, with its simulant being somewhat weaker, ~0.22 kbar. Scanning electron microscopy and electron microprobe analysis were used to characterize the microstructures of the materials and to determine the details of the spall events. 20 refs., 19 figs., 9 tabs.

2261 (DOE/PC/30021–T20) **Slurry reactor hydrodynamics studies: Final report.** Air Products and Chemicals, Inc., Allentown, PA (USA). 1985. 152p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-80PC30021. Order Number DE90002792. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Air Products has completed a three-year DOE contract in which new slurry phase catalysts (Task 2) and slurry phase bubble column reactor correlations (Task 3) for the Fischer-Tropsch synthesis were developed. This report presents results from the reactor studies. Using both a 12.7 and a 30.5 cm diameter cold flow simulator, phase holdups, phase dispersion coefficients, and interphase heat and mass transfer coefficients were measured and correlated. This information was incorporated into a computer model of a three-phase bubble column. The heat and mass transfer and phase dispersion correlations were found to conform to the literature, while the phase holdup correlations were different. Combining product distributions from the Task 2 catalyst tests with the results of the Task 3 hydrodynamic studies allowed prediction of space-time yields of product fuel fractions in large-scale slurry bubble columns. 106 refs., 37 figs., 27 tabs.

2262 (DOE/PC/30021–T21) **Catalyst and reactor development for a liquid phase Fischer-Tropsch process: Final report for Task 2.** Air Products and Chemicals, Inc., Allentown, PA (USA). [1989]. 54p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-80PC30021. Order Number DE90002793. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The preparation, characterization, and performance of a range of metal catalysts for use in slurry phase Fischer-Tropsch technology was investigated with the objective of developing new compositions with improved selectivity for gasoline and diesel fuel range hydrocarbons. A series of conventional catalysts was identified for testing for both gas and slurry phases. A gas phase screening protocol was set up to allow reasonably rapid determination of each catalyst's synthesis gas conversion characteristic over a range of operating conditions. The catalysts selected represented a range of catalytic metals known to promote conversion of synthesis gas to hydrocarbon liquids. Both precipitates and supported variations of these metals were studied. Catalysts studied include: ruthenium-based catalysts with osmium, and cobalt carbonyl supported on zirconia promoted. 23 refs., 2 figs., 10 tabs.

2263 (DOE/PC/30021–T22) **Catalyst and reactor development for a liquid phase Fischer-Tropsch process: Final report for Task 4.** Air Products and Chemicals, Inc., Allentown, PA (USA). [1989]. 92p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-80PC30021. Order Number DE90002794. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The US Department of Energy contracted with Air Products and Chemicals, Inc. to design a bench-scale bubble column reactor unit for Fischer-Tropsch slurry catalyst operations. The resulting process design includes the reaction, wax withdrawal, and product fractionation sections of a bench scale Fischer-Tropsch reactor. The design of the bench-scale Fischer-Tropsch reactor (BFTR) is based upon reaction rates and product yields measured with the slurry-phase catalysts that Air Products developed and evaluated in Task 2 of this contract and on results of a cold-flow hydrodynamic study of the bubble-column reactor that was conducted under Task 3 of the contract. The goal of Task 4 is to design the reactor and wax withdrawal portions of the reactor and estimate total cost of the system. 5 refs., 2 figs., 17 tabs.

2264 (DOE/PC/90014–T2) **Upgrading of light Fischer-Tropsch products: Quarterly report No. 6, January 1, 1988–March 31, 1988.** UOP, Inc., Des Plaines, IL (USA). 11 Jul 1989. 113p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-86PC90014. Order Number DE90003033. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Work during this quarter concentrated on Task 4 of the study. The objective of this task is to evaluate the applications of the UOP/BP Cyclar process to the upgrading of Fischer-Tropsch LPG products into aromatics. Task 4.0 is divided into three major subtasks: 4.1 – Huels CSP Study; 4.2 – Indirect Cyclar Processing; and 4.3 – Direct Cyclar Processing. In the Direct Cyclar route, Fischer-Tropsch LPG is fed directly to the Cyclar unit. In the Indirect route, the LPG is first processed by Huels CSP to reduce the olefin content and then sent to the Cyclar unit. This quarterly report covers all Cyclar pilot plant results conducted within this contract (subtasks 4.1 and 4.2). The yield distribution of xylenes, toluene, and benzene is discussed along with catalyst stability and activity. 45 figs., 7 tabs.

2265 (DOE/PC/90014–T3) **Upgrading of light Fischer-Tropsch products: Quarterly report No. 7, April 1, 1988–June 30, 1988.** UOP, Inc., Des Plaines, IL (USA). 11 Jul 1989. 39p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-86PC90014. Order Number DE90003032. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Work during this quarter concentrated on Task 4 of the study. The objective of this task is to evaluate the application of the UOP/BP Cyclar® process to the upgrading of Fischer-Tropsch LPG products into aromatics. Results from pilot plant studies conducted within Task 4 were translated into commercial yield estimates. This quarterly report describes the translation process, and documents the results. 3 refs., 12 figs., 20 tabs.

2266 (NEI-DK–217) **Two-step process for conversion of lignocellulose into methane.** Richards, S.R.; Spendler, F.H. Teknologisk Inst., Taastrup (Denmark). Bioteknik. Jul 1989. 105p. Order Number DE90719033. Available from NTIS (US Sales Only), PC A06/MF A01.

EFP-86; EFP-87. In cooporation with BIOTAL Ltd., Llanishen, Cardiff (GB).

On-field burning of straw becoming prohibited throughout the EEC. Straw can represent a large potential source of energy for the production of biogas (methane) by anaerobic digestion but the lignocellolosic nature of the straw means that digestion is slow and yields may be poor. This study aims to examine the potential for a biological pretreatment using white-rot fungi to enhance the digestibility of barley straw, and to optimise the subsequent anaerobic digestion of partially delignified material. Among a wide range of white-rot fungi tested, PLEUROTUS OSTREATUS strains selectively delignify barly straw and produced a cellulose-rich straw. This cellulose-rich straw more than doubled the yield of reducing sugars during a cellulase digestion, and increased the methane yield by 22% more compared with untreated straw. However, when the dry matter lossed in the pretreatment are included in the estimations, there is no net increase in methane yield compared to untreated straw. As expected the methane yield increased with retention times when straw is digested in continously-fed digesters. Loading rates higher than 1.25 g straw/l digester/day resulted in a rapid drop in pH and inhibition of methanogenesis. Straw pretreated with PLEUROTUS OSTREATUS strains and digested in continously-fed reactors gave the similar results as batch-fed digestion. During anaerobic digestion hemicellulose was hydrolysed to the same extent over the range of retention times studied (10 to 47.5 days) whereas cellulose hydrolysis increased with increasing retention time. Chemical pretreatment of straw was found to be a more efficient method than biological pretreatment. Sodium hydroxide, mild acid and alkaline perioxide pretreatment increased the biogas yield between 15 and 160%. (AB).

2267 (PB–89-230643/XAB) **Photoconversion of inorganics to methane. Final topical report, October 1987-February 1989.** Copeland, R.J.; Feinberg, D.; Karpuk, M.; Wright, J. TDA Research, Inc., Wheat Ridge, CO (USA). May 1989. 70p. (TDA–89-GRI-002). Available from NTIS, PC A04/MF A01.

This report evaluates the cost of producing gaseous fuels from carbon dioxide, water, and solar energy. Such a process must have

high conversion efficiency and low capital costs per unit of collection area to be economically attractive. A novel pond reactor is designed that has a cost much lower than other conversion facilities but still higher than is needed to produce economically competitive fuels at projected efficiencies. Due to a change in supply strategy away from long-term synthetic routes to gaseous fuels, GRI has redirected this contract to evaluate other inorganic-chemistry-related projects.

2268 (PB–89-232615/XAB) **Biological and biochemical methane reactions. Final report, March 1986-March 1989.** Dalton, H.; Pienkos, P.T.; Stirling, D.I. Celgene Corp., Warren, NJ (USA). Apr 1989. 50p. Available from NTIS, PC A03/MF A01.

See also PB–88-232764.

The purpose of this project was to characterize the nature of the active site involved in methane activation by enzymes from well characterized and newly isolated methane-oxidizing bacteria. Kinetic and structural studies provided an initial picture of how the soluble methane monooxygenase (MMO) enzyme is structured and operates to selectively oxidize methane to methanol under ambient conditions. Cloning and sequencing of genes coding for some of the sMMO proteins were completed, and 72 strains of methanotrophs were isolated from extreme environments.

2269 (ANL/CNSV–69) **Biocrude suitability for petroleum refineries.** Schmalzer, D.K.; Gaines, L.L.; Herzenberg, C.L.; Snider, M.A. Argonne National Lab., IL (USA). Jun 1988. 91p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. Order Number DE90002619. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Technologies are now being developed that could produce crude oil from biomass, making available an alternative fuel source as petroleum supplies dwindle and prices rise. If the existing infrastructure for transporting and refining petroleum could be used for biocrude, the transition from petroleum would be smoother and less costly. This report examines the suitability of the existing systems for transporting biocrude and processing it into gasoline. Available biomass production areas were identified and potential production was estimated. Production areas with the potential to supply conversion plants were then matched with transportation paths and refinery locations to minimize transportation costs. Technical requirements for treating biocrude were examined, based on its expected chemical composition and physical properties, and compared to existing refinery equipment and capacity. Environmental constraints were taken into account at each step. Although biomass-derived oils could be transported to refineries the existing refinery equipment is not optimal for upgrading these oils to a gasoline-grade product. Furthermore, existing hydrogen production capacity is grossly inadequate for upgrading substantial volumes of biocrude. Partial or total upgrading at conversion facilities or regional upgrading facilities is discussed briefly, but in-depth evaluation of such options is beyond the scope of this study. 82 refs., 26 figs., 35 tabs.

2270 (ETDE-mf–0721936) **Investigation of the formation and chemical aspects of coke deposits occurring on acid, monofunctional zeolite catalysts through typical reactions with hydrocarbons.** Karge, H.G. Fritz-Haber-Institut der Max-Planck-Gesellschaft, Berlin (Germany, F.R.). 1987. 17p. (In German). Contract BMFT 03C 231 1. Order Number DE90721936. Available from NTIS (US Sales Only), PC A03/MF A01.

Zeolite catalysts of the firm DEGUSSA were characterized with physico-chemical methods. For the determination of the 'acidity' (nature, density and stability of the acid centres), the IR spectroscopy with and without probe molecules as well as the temperature-programmed desorption of ammonia (NH_3-TPD) were used. The transmission UV/VIS spectroscopy made it possible to observe the preceding stages of the coke formation under the influence of methanol in dependence on the reaction temperature. These results were compared with those of the ethylene reaction. The spectra of the working catalysts and the obtained conversions on the preparation in the IR cell were measured at the same time by in-situ IR measurements. (orig./RB).

2271 **Development of the foundation for direct conversion of methane to methanol.** Finch, F.T.; Baughcum, S.L.; Beattie, W.H.; Danen, W.C.; Ferris, M.J.; Lyman, J.L.; Odlenborg, R.C.; Rofer, C.K.; Streit, G.E. 1p. American Institute of Chemical Engineers, New York, NY (1988). (CONF-881143–: American Institute of Chemical Engineers annual meeting, Washington, DC (USA), 27 Nov - 2 dec 1988).

Technical Paper 166E.

Methanol is currently produced from methane by the catalytic oxidation of methane to synthesis gas, followed by catalytic methanol synthesis. A single-step partial oxidation of methane to methanol would be highly desirable, if the reaction kinetics could be controlled. Using such an approach, the authors have experimentally achieved 70% conversion selectively to methanol at low yield, and have developed a predictive free-radical chemical kinetics model based on fundamental measurements. This model is described in this paper. Oxidation of methane with slightly substoichiometric to stoichiometric concentrations of oxygen at pressures greater than 50 atm and temperatures in the range of 800-1000 K is predicted to give attractive yields of methanol when the free-radical populations can be controlled and the reaction can be optimally terminated.

0904 Solid Waste and Wood Fuels

2272 (NEI-DK–212) **Flue gas condensation in stoking system for wood chips.** Evald, A. Skovteknisk Inst., Copenhagen (Denmark). Jan 1988. 22p. (In Danish). Order Number DE90718977. Available from NTIS (US Sales Only), PC A03/MF A01.

The text is based on a study of relevant literature and is concerned with the condensation of flue gas from wood-chip fuelled plants. As wood-chips have a heavy water content there is a considerable energy potential in the steam resulting from the combustion of this fuel, which has a much lower content of noxious gases than other emissions. The content of pollutive substances is analized, and the method of condensation is described. Possibilities for energy saving and reduction of environmental pollution involved in the utilization of this process are briefly discussed. (AB) 23 refs.

2273 (PB–89-230510/XAB) **Fuel-supply structure of wood-fired power plants in the Northeast: Loggers' perspective. Forest Service research paper.** Huyler, N.K. Forest Service, Broomall, PA (USA). Northeastern Forest Experiment Station. Jul 1989. 26p. (FSRP-NE–624). Available from NTIS, PC A03/MF A01.

This study gauges loggers' perceptions of the impact of large biomass demand centers (electrical power generation) on the forest resource base in the Northeast. The loggers who supply these demand centers are business people with large capital investments in highly mechanized harvesting systems. Most of the loggers surveyed strongly believed that the post-harvest stand has improved as a result of fuel-wood chipping; however, the impact of chip harvesting on the forest resource base was not clear.

2274 (SLU-ISK–179) **Handling characteristics of wood fuels - angle of repose for different assortments.** Mattsson, J.E. Swedish Univ. of Agricultural Sciences, Garpenberg (Sweden). Dept. of Operational Efficiency. Mar 1989. 55p. (In Swedish). Order Number DE90719393. Available from NTIS (US Sales Only), PC A04/MF A01.

Most operational problems in energy plants using wood fuels are related to storage and internal transport of the fuel. Sometimes expensive reconstruction has been necessary. These problems depend to a great extent on insufficient knowledge of basic handling characteristics of wood fuels. Therefore, the angle of repose, friction against different surfaces, freezing behaviour and tendency of bridging are studied for different wood fuels. The study aims at finding relations between the angle of repose and particle shape, size distribution and moisture content. The angle of repose was found to vary between 25 and 55 degrees. It was much lower, 25-30 degs, for dry chunkwood from delimbed birch with a particle length of 180 mm, than for other wood fuels, that had 35-55 degs. The particle shape and moisture content had a significant influence on the angle of repose. Particle size (particle length) had no significant influence on the angle of repose. (With 19 figs., 5 tables).

2275 (STU–86-4162) **Separation of wood chips for energy production.** Westermark, M. Swedish National Board for Technical Development, Stockholm (Sweden). 15 Aug 1988. 79p. (In Swedish). Order Number DE90719415. Available from NTIS (US Sales Only), PC A05.

App. 3 illegible.

A literature and patent study gave the following results. If separation of compression wood chips is done before pulp manufacture it should be possible to obtain lower consumption of chemicals for cooking and bleaching, better strength properties of the pulp, and a decreased formation of organic chlorine compounds in the pulp in bleachplant waste water. The separated compression wood chips is suitable to be used for energy production. The separation can be done by density separation or stratification. Density separation is done by airing the water with tiny bubbles, the air-water mixture obtaining a density of c. 600 kg/m^3. The lighter normal wood then rises to the surface whereas the compression wood sinks. (author).

13 HYDRO ENERGY

1301 Resources and Availability

2276 (ETSU-SSH–4063-P1) **Small scale hydroelectric generation potential in the UK. V. 1.** Department of Energy, London (UK); UKAEA Harwell Lab. (UK). Energy Technology Div. 1989. 152p. Order Number DE90722760. Available from NTIS (US Sales Only), PC A08.

This study, commissioned by the Energy Technology Support Unit for the Department of Energy, undertakes the first comprehensive assessment of the economic potential for small-scale hydro-electric generation throughout the UK. Whilst small hydro technology is well understood, and many sites appear economic initially, there is little evidence of actual deployment of the technology. Accordingly, consideration has been given to factors affecting development, including land ownership, Water Authority abstraction charges, Local Authority rates, energy usage and environmental considerations. The scope of the study extended to both run-of-river sites and sites within the Water Industry in the UK, with installed capacities in the range 25kW to 5MW. (author).

1306 Environmental Aspects

2278 (DOE/BP/12659–5) **Quantification of Hungry Horse Reservoir water level needed to maintain or enhance reservoir fisheries: Methods and data summary, 1983–1987.** May, B.; Glutting, S.; Weaver, T.; Michael, G.; Morgan, B.; Suek, P.; Wachsmuth, J.; Weichler, C. USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Montana Dept. of Fish, Wildlife and Parks, Kalispell, MT (USA). Jun 1988. 148p. Sponsored by U.S. DOE Bonneville Power Administration; U.S. DOE Management & Administration. DOE Contract AI79-83BP12659. Order Number DE90002772. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

The Hungry Horse Reservoir study is part of the Northwest Power Planning Council's resident fish and wildlife plan. The plan is responsible for mitigating damages to the fish and wildlife resources caused by hydroelectric development in the Columbia River Basin. The major goal of our study is to quantify seasonal water levels needed to maintain or enhance the reservoir fishery. This study began in May, 1983, and the initial phase will be completed July, 1988. This report summarizes limnological, fish abundance, fish distribution and fish food habits data collected from 1983 to 1988. The effect of reservoir operation upon fish habitat, fish food organisms and fish growth is discussed. 71 refs., 36 figs., 46 tabs.

2279 (DOE/BP/35245–2) **Assessment of smolt condition for travel time analysis: Annual report 1988.** Rondorf, D.W.; Beeman, J.W.; Faler, J.C.; Free, M.E.; Wagner, E.J. Fish and Wildlife Service, Seattle, WA (USA). Seattle National Fishery Research Center. Mar 1989. 115p. Sponsored by U.S. DOE Management & Administration. DOE Contract AI79-87BP35245. Order Number DE90002782. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Estimates of migration rates and travel times of juvenile salmonids within index reaches of the Columbia River basin are collected through the Smolt Monitoring Program for use by the Fish Passage Center. With increased reliance upon travel time estimates in 1988 by the Fish Passage Center, this study was implemented to monitor the biological attributes of juvenile chinook salmon Oncorhynchus tshawytscha and steelhead trout O. mykiss used for the travel time estimates. The physiological ability of fish to respond to stress was assessed by measuring levels of plasma cortisol, glucose, and chloride before and after a stress-challenge test. The development of smoltification was evaluated by measuring gill Na^+K^+-ATPase, plasma thyroxine, purines, and body morphology. Most groups were similar at the hatcheries but differed as the migration to McNary Dam proceeded. The prevalence of bacterial kidney disease (BKD) in spring chinook salmon was evaluated using the enzyme linked immunosorbent assay (ELISA) and fluorescent antibody technique (FAT). Prevalence of BKD in groups tested using the ELISA method was as high as 99% at some downstream locations. A review of indices is presented as a guide to the development of an index of smolt condition and preliminary data are presented. An index could be used as a tool to synthesize information on fish condition to assist with management and evaluation of the Water Budget.

2280 (DOE/BP/39643–3) **Use of a fish transportation barge for increasing returns of steelhead imprinted for homing: Final report.** Harmon, J.R.; Slatick, E. National Marine Fisheries Service, Seattle, WA (USA). Coastal Zone and Estuarine Studies Div. Aug 1989. 134p. Sponsored by U.S. DOE Management & Administration. DOE Contract AI79-83BP39643. Order Number DE90002783. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

The objective of this 7-year National Fisheries Service study, which began is 1982, was to determine if transporting juvenile steelhead (Oncorhynchus mykiss) by truck and barge from Dworshak National Fish Hatchery (NFH), on the Clearwater River, to a release site on the Columbia River below Bonneville Dam would result in increased returns of adults to the various fisheries and to the hatchery homing site. During 1982 and 1983, over 500,000 marked juvenile steelhead were serially released as controls from the hatchery or barged as test fish to below Bonneville Dam. Recoveries of marked adults to various recovery sites are complete. Fish released in 1983 showed a stronger homing ability and more rapid upstream migration than test fish released in 1982. Most adults from both control and test releases in 1983 and control releases in 1982 migrated a considerable distance upstream and overwintered in the Snake and Clearwater Rivers–behavior similar to Clearwater River fish previously transported from Lower Granite Dam. In contrast, many of the adults from test releases in 1982 failed to migrate upstream during the fall, overwintered in the Columbia River, and migrated upstream the following spring. Survival of control fish released at Dworshak NFH in late April 1982 was substantially higher than survival of those released in mid-May. Survival and homing of control fish released in late April and early May 1983 were over 10 times that for

fish released in late May. Return of adults from normal hatchery releases in 1982 was the highest ever observed at Dworshak NFH.

2281 (DOE/BP/65903–2) **State of Idaho augmented anadromous fish health monitoring: Annual report, FY 1988.** Foott, J.S.; Hauck, A.K. USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife; Idaho Dept. of Fish and Game, Eagle, ID (USA). Eagle Fish Health Lab. Sep 1989. 51p. Sponsored by U.S. DOE Bonneville Power Administration; U.S. DOE Management & Administration. DOE Contract AI79-87BP65903. Order Number DE90002781. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report documents the progress in the assigned tasks which have occurred during the second year of the Augmented Anadromous Fish Health Monitoring Project. Fish at seven Idaho Department of Fish and Game facilities were monitored for various pathogens and organosomatic analyses were performed on smolts prior to their release in the spring of 1989. A disease database has been developed and facility impediments to fish health have been identified. 12 refs., 14 tabs.

2282 (PB–89-224125/XAB) **Jubba Environmental and Socio-economic Studies (JESS). Final report.** Associates in Rural Development, Inc., Burlington, VT (USA). 1989. 1431p. Available from NTIS, PC EE99/MF E99.

Set includes PB–89-224133 through PB–89-224166.

A separate abstract was prepared for each of the four volumes of this set.

2283 (PB–89-224133/XAB) **Jubba Environmental and Socio-economic Studies (JESS). Volume 1. Executive report. Final report.** Associates in Rural Development, Inc., Burlington, VT (USA). 1989. 141p. Available from NTIS, PC A07/MF A01.

Jubba Environmental and Socio-economic Studies (JESS) was carried out as a three-phase project to collect environmental and socio-economic data in Somalia's Jubba Valley, the site of proposed development of a large hydroelectric dam. Complementary to construction of the dam, various plans are being prepared for subsequent development of irrigated agriculture in the middle and lower Jubba Valley. Numerous environmental and socio-economic changes will occur with dam construction, filling of the reservoir, infrastructural enhancement, and intensification of agriculture. Volume I, the Executive Report, and reports based on JESS longer-term studies (TEBS and SEBS) represent the most comprehensive assessment of the overall JESS effort: these reports consider and, in most cases, summarize the findings of other investigations.

2284 (PB–89-224141/XAB) **Jubba Environmental and Socio-economic Studies (JESS). Volume 2. Environmental studies. Final report.** Associates in Rural Development, Inc., Burlington, VT (USA). 1989. 671p. Available from NTIS, PC A99/MF A01.

See also Volume 1, PB–89-224133 and Volume 3, PB–89-224158.; Also available in set of 4 reports PC E99, PB–89-224125.

The Jubba Environmental and Socio-economic Studies (JESS) investigated conditions in the Jubba Valley of southern Somalia. Projections from that baseline information were intended to elucidate changes likely to occur as a result of construction of a high dam near Baardheere and related developments. In particular, JESS was required to suggest ways of mitigating adverse impacts, enhancing potentially good impacts, and to draw up a program for future environmental and socio-economic monitoring. The report contains an analysis of the Terrestrial Ecology Baseline Studies (TEBS) section of the JESS project. Human use of biological resources is examined from the perspectives of land use, forestry, rangelands, and biological conservation. TEBS activities are used as the basis for a future monitoring program of terrestrial ecology.

2285 (PB–89-224158/XAB) **Jubba Environmental and Socio-economic Studies (JESS). Volume 3. Socio-economic studies. Final report.** Associates in Rural Development, Inc., Burlington, VT (USA). 1989. 497p. Available from NTIS, PC A21/MF A01.

See also Volume 2, PB–89-224141 and Volume 4, PB–89-224166; Also available in set of 4 reports PC E99, PB–89-224125.

The Government of the Somali Democratic Republic (GSDR), with the support of the international donor community, is prepared to launch a comprehensive program for the development of Jubba Valley. The keystone of the program is construction of a dam on the Jubba River near Baardheere. Planners have been looking toward construction of the dam, among other things, to increase agricultural output by fostering irrigation development. The objectives of the Socio-economic Baseline Study (SEBS) report are to: present a body of a new information on socio-economic life in Jubba Valley; assess the impact of development efforts on socio-economic life; recommend measures to enhance beneficial impacts and mitigate adverse ones; and propose a program to monitor the progress of those impacts and interventions.

2286 (PB–89-224166/XAB) **Jubba Environmental and Socio-economic Studies (JESS). Volume 4. Bibliography. Final report.** Associates in Rural Development, Inc., Burlington, VT (USA). 1989. 122p. Available from NTIS, PC A06/MF A01.

See also Volume 3, PB–89-224158; Also available in set of 4 reports, PC E99, PB–89-224125.

This bibliography is a revised version of the Jubba Environmental and Socio-economic Study (JESS) bibliography that was published in 1986, relating specifically to social and environmental systems in Somalia as well as river-basin assessment and planning, in general. Many new references have been added and the bibliography has been organized into 22 different sections, corresponding to the subject codes (BIBCODE) being used by the JESS team in Somalia. The bibliography includes selected monographs, conference papers, journal articles, book chapters, reports, JESS studies and dissertations. Users should recognize that the bibliography is neither definitive nor comprehensive, and that an inclusion of a particular reference does not imply that its scientific merit has been substantiated.

2287 (VTT-TIED–986) **Ecological aspects of lake regulation in Northern Finland. Part 2. Geomorphology and vegetation of the littoral zone.** Hellsten, S.; Alasaarela, E.; Keraenen, R.; Nykaenen, M.; Neuvonen, I. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. 148p. (In Finnish). Order Number DE90719338. Available from NTIS (US Sales Only), PC A07/MF A01.

Ecological aspects of lake regulation were studied in certain lakes in northern Finland in 1984-1987. The general aims of the project were to analyze the effects of regulation on lake ecosystems and to produce information that can be applied when assessing the possible effects of hydroelectric projects. The effects of lake regulation were easy to observe in the littoral zone of Lake Ontojaervi, the sandy shores in particular were unstable both above and below the water level. The shores were very much steeper than those of Lake Lentua, which affected the distribution of bottom types, minerogenic bottoms were more common than in the latter lake. The results from the two lakes were used to calculate a simple model to forecast the distribution of bottom types of Lake Ontojaervi before regulation. The effect of penetration by ice was also easy to recognize on the shores of Lake Ontojaervi; the surface sediment being frozen to a greater depth than in Lake Lentua. Beneath the freezing zone in ice just pressed down on the sediment. The littoral vegetation decreased markedly after regulation and was entirely absent in open places. Changes in abundance were particularly clear, with decreases in the large isoetides and helophytes and increases of small isoetides. The results from Lake Lentua were used to formulate a simple ecological model for the frequency of macrophytes.

2288 (VTT-TIED–987) **Ecological aspects of lake regulation in northern Finland. Part 3. Macrozoobenthos and feeding of fish.** Tikkanen, P.; Hellsten, S.; Alasaarela, E.; Kantola, L.; Niva, T. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. 114p. (In Finnish). Order Number DE90719339. Available from NTIS (US Sales Only), PC A06/MF A01.

Ecological aspects of lake regulation were studied in certain lakes in northern Finland in 1984-1987. The general aims of the project were to analyze the effects of regulation on lake ecosystems and to produce information that can be applied when assessing the possible effects of hydroelectric projects. The abundances of benthic animals were 2-3 times higher in the unregulated Lake Lentua than in the regulated Lake Ontojaervi depending on the year, although they were greater on the till shores than on the sandy shores with

both cases. There were also differences in the dominance of certain animal groups and in the diversity of the communities. The number of benthic animals differ in lakes with contrasting regulation procedures, as observed in the present data and in previously published material. In the Lake Nuasjaervi for example, where the summertime mid-water level has been raised only slightly, the abundance and the composition of the fauna resembled the figures for an unregulated lake. Previously published suggest that the abundance of benthic animals (averaged over several years and several habitats) varies in the range 0.5-5 mg/m^2 in regulated lakes and 1-8 mg/m^2 in unregulated lakes.The reduction in the abundance of benthic animals caused by freezing and drying was also seen in the feeding of fish in the early summer, when the stomach fullness values of the white-fish and more especially those of the perch, were notably higher in Lake Lentua than in Lake Ontojaervi.

2289 (VTT-TIED–988) **Ecological aspects of lake regulation in northern Finland. Part 4. Spawning and the survival of the young fish.** Huusko, A.; Sutela, T.; Karjalainen, J.; Hellsten, S.; Hirvonen, A. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. 99p. (In Finnish). Order Number DE90719340. Available from NTIS (US Sales Only), PC A05/MF A01.

Report of the project ECOREGU.

The ecological aspects of lake regulation were studied in certain lakes in Northern Finland in 1984-1987. The aims of the project were to produce information that can be applied, when assessing possible effects of hydroelectric projects. The impacts of water level regulation on the eggs and larvae of both autumn and spring spawning fish were studied by comparing the survival of eggs and larvae, larval densities and the food, feeding and growth of larvae in two neighbouring lakes, in Lake Ontojaervi, regulated with an amplitude of 4.4 m, and Lake Lentua, which remains in a natural state. Survival of eggs of the autumn spawning fish was minimal in the regulation zone of Lake Ontojaervi, while in Lake Lentua and outside the regulation zone in Lake Ontojaervi the chemical properties of the bottom sediment were the most important factors affecting the survival of the eggs in different depth zones. The number and dispersal of the larvae of the vendace, the main autumn spawning fish, varied markedly in the two lakes. The most probable causes of the differences in larval densities were the destruction of the eggs in the regulation zone during the winter and a change in the behaviour and feeding conditions of larvae in Lake Ontojaervi. The density of spring spawning fish was lower in Lake Ontojaervi than in Lake Lentua, one possible reason for this being the diminution of the spawning areas in spring due to the low water level.

2290 (VTT-TIED–989) **Ecological aspects of lake regulation in Northern Finland. Part 5. Regulation practices and ecological effects.** Alasaarela, E.; Hellsten, S.; Tikkanen, P.; Huusko, A. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. 53p. (In Finnish). Order Number DE90719341. Available from NTIS (US Sales Only), PC A04/MF A01.

Report of the project ECOREGU.

Ecological aspects of lake regulation were studied in certain lakes in northern Finland in 1984-1987. The general aims of the project were to analyze the effects of regulation on lake ecosystems and to produce information that can be applied when assessing the possible effects of hydroelectric projects on other forms of utilization of the lakes concerned and when looking for alleviating the adverse effects. In order to maintain an ecological balance in reulated lakes in northern Finland it is important that: The lake water level is not raised so far above the highest natural water level that it will initiate any marked geomorphological processes in the littoral zone. The drop in lake water level during the midwinter should not expose the main part of the productive zone. The effects of a rise water level caused by regulation are greater in large oligotrophic lakes than in small eutrophic lakes. The resulting changes in geomorphological processes will reshape the shores within a few years. If the summer water level is raised, ecological adaptation will be accellerated, which will reduce the amount of water vegetation. This will have a great influence on the landscape and on the food resources and spawing areas of fish. Freezing of the bottom sediment in the littoral zone is a much greater ecological distrubance factor than the weight of the ice. It is easy to reduce the area of frozen sediment by reducing the drop in water level early in the winter. The new important limit will then be the lowest midwinter water level, which will be of greater ecological importance than lowest level reached during the late winter. This limit can be calculated provided that the colour of the water (amount of humic substances) is known.

2291 (ETDE-mf–0717862) **Estimation of aerosol absorption from measurements of intensity and polarization of the sky radiation at Tsumeb (Namibia). Final report.** Quenzel, H.; Thomalla, E.; Tamm, E. Muenchen Univ. (Germany, F.R.). Meteorologisches Inst. Apr 1988. 45p. (In German). DFG Qu 28/21-1. Order Number DE90717862. Available from NTIS (US Sales Only), PC A03/MF A01.

Measured data of the sky radiation polarization from a radiation measurement campaign in Tsumeb (Namibia) in the year 1971 were used for the determination of the aerosol absorption. The aim of this measurement campaign was to determine all directly measurable parameters for the aerosol properties and the radiation properties of the atmosphere. By means of the results of the measurement campaign, model calculations for the celestial polarization for different values of the imaginary part of the refractive index are carried out. The imaginary part is then determined by the comparison between measurement/calculation. This method is dealt with and discussed in detail by means of the evaluation of the exemplary measurement days. The thus determined absorption proportion is much higher than bibliographical data for aerosol in rural areas; bush fires as a source of soot as well as dark soil samples explain the higher absorption proportion. The data of this measurement campaign are still too uncertain in specific points to make reliable statements. With an improved measurement technique, however, it is possible to use the method in future measurement campaigns. (orig.).

2292 (N–89-27623) **Solar radiation on Mars.** Appelbaum, J.; Flood, D.J. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Aug 1989. 33p. (NASA-TM–102299;E–4865;NAS–1.15:102299). Available from NTIS, PC A03/MF A01.

Detailed information on solar radiation characteristics on Mars are necessary for effective design of future planned solar energy systems operating on the surface of Mars. Presented here is a procedure and solar radiation related data from which the diurnally, hourly and daily variation of the global, direct beam and diffuse insolation on Mars are calculated. The radiation data are based on measured optical depth of the Martian atmosphere derived from images taken of the sun with a special diode on the Viking cameras; and computation based on multiple wavelength and multiple scattering of the solar radiation.

2293 (ETDE-mf–0722258) **Photovoltaic energy conversion - research projects on solar energy use.** BMFT - Pressereferat. Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). 23 Nov 1988. 51p. (In German). Order Number

DE90722258. Available from NTIS (US Sales Only), PC A04/MF A01.

The report reviews the development of photovoltaic energy conversion and the past and present BMFT-funded research in this field, most of which is orientated towards immediate applicability. There is a trend in the direction of marketable products for solar energy use. The report lists invitations for tender in the field of photovoltaic applications, addresses to contact, and the currently sponsored research projects, including names of companies and institutions. (ORU).

2294 (JAERI-M–89-085) **Radiation resistance of solar cells for space application, 1. Study on the irradiation procedure of electron beams.** Mitsui, Hiroshi; Tanaka, Ryuichi; Sunaga, Hiromi and others. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1989. 172p. (In Japanese). Order Number DE90719546. Available from NTIS (US Sales Only), PC A08/MF A01.

A 50-μm thick ultrathin silicon solar cell and a 280-μm thick high performance AlGaAs/GaAs solar cell with high radiation resistance have been recently developed by National Space Development Agency of Japan (NASDA). In order to study the radiation resistance of these cells, a joint research was carried out between Japan Atomic Energy Research Institute (JAERI) and NASDA from 1984 through 1987. In this research, the irradiation method of electron beams, the effects of the irradiation conditions on the deterioration of solar cells by electron beams, and the annealing effects of the radiation damage in solar cells were investigated. This paper is the first one of a series of reports of the joint research. In this paper, the space radiation environment which artificial satellites will encounter, the solar cells used, and the experimental methods are described. In addition to these, the results of the study on the irradiation procedure of electron beams are reported. In the study of the irradiation method of electron beams, three methods, that is, the fixed irradiation method, the moving irradiation method, and the spot irradiation method were examined. In the fixed irradiation method and moving one, stationary solar cells and solar cells moving by conveyer were irradiated by scanning electron beams, respectively. On the other hand, in the spot irradiation method, stationary solar cells were irradiated by non-scanning steady electron beams. It was concluded that the fixed irradiation method was the most proper method. In addition to this, in this study, some pieces of information were obtained with respect to the changes in the electrical characteristics of solar cells caused by the irradiation of electron beams. 2295 (N–89-27619) **Lunar production of solar cells.** Landis, G.A.; Perino, M.A. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. May 1989. 18p. (NASA-TM–102102;E–4866;NAS–1.15:102102;CONF-8905228–: 9. biennial SSI/Princeton conference on space manufacturing, Princeton, NJ (USA), 10 May 1989). Available from NTIS, PC A03/MF A01.

The feasibility of manufacturing solar cells on the moon for spacecraft applications is examined. Because of the much lower escape velocity, there is a great advantage in lunar manufacture of solar cells compared to Earth manufacture. Silicon is abundant on the moon, and new refining methods allow it to be reduced and purified without extensive reliance on materials unavailable on the moon. Silicon and amorphous silicon solar cells could be manufactured on the moon for use in space. Concepts for the production of a baseline amorphous silicon cell are discussed, and specific power levels are calculated for cells designed for both lunar and Earth manufacture.

2296 (N–89-27705) **NASA advanced space photovoltaic technology-status, potential and future mission applications.** Flood, D.J.; Piszczor, M. Jr.; Stella, P.M.; Bennett, G.L. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. 1989. 8p. (NASA-TM–102093;E–4856;NAS–1.15:102093;CONF-8910243–: European space power conference, Madrid (Spain), 2-6 Oct 1989). Available from NTIS, PC A02/MF A01.

The NASA program in space photovoltaic research and development encompasses a wide range of emerging options for future space power systems, and includes both cell and array technology development. The long range goals are to develop technology capable of achieving 300 W/kg for planar arrays, and 300 W/sq m for concentrator arrays. InP and GaAs planar and concentrator cell technologies are under investigation for their potential high efficiency and good radiation resistance. The Advanced Photovoltaic Solar Array (APSA) program is a near term effort aimed at demonstrating 130 W/kg beginning of life specific power using thin (62 micrometer) silicon cells. It is intended to be technology transparent to future high efficiency cells and provides the baseline for development of the 300 W/kg array.

2297 (NEI-DK–210) **Development of a container for pumps, measuring equipment and motorgenerators in connection with a bioconversion energy system.** Moeller, E. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). May 1989. 47p. (In Danish). Order Number DE90718968. Available from NTIS (US Sales Only), PC A03/MF A01.

This project, financed by the Council of Technology in Denmark, is concerned with the design of a container for pumps, measuring instruments and motor generators in connection with heating systems based on bioconversion for use on farms. Housing this form of equipment has often posed a problem as it could necessitate the construction of new buildings involving extra cost. The container and its functioning is briefly described and a number of detailed engineering drawings are presented. (AB) 6 maps.

BIOMASS is an interactive microcomputer program that uses allometric regression equations to calculate aboveground biomass of common tree species of the Lake States. The equations are species-specific and most use both diameter and height as independent variables. The program accommodates fixed area and variable-radius sample designs and produces both individual tree and areal estimates of whole-tree oven-dry weights.

2299 (PB–89-230189/XAB) **Geographic variation in red alder. Forest Service research paper.** Lester, D.T.; DeBell, D.S. Forest Service, Portland, OR (USA). Pacific Northwest Research Station. Apr 1989. 13p. (FSRP-PNW–409). Available from NTIS, PC A03/MF A01.

A test of 10 provenances was established in 1969 on the central coast of Oregon. The provenances tested included Juneau, Alaska, and Sandpoint, Idaho, in addition to eight well-spaced locations in Oregon, Washington, and in the southern end of Vancouver island, British Columbia. Periodic measurements through 15 years of plantation development revealed differences among provenances in height, diameter, and height/diameter ratio. The calculated variables, bole volume and aboveground biomass, showed large differences among provenances. Two provenances from northwestern Washington consistently were the most vigorous, two (Juneau, Alaska, and Sandpoint, Idaho) were the least vigorous, and the remaining six provenances shifted somewhat in ranking over time.

2300 (PB–89-870869/XAB) **Cellulose and lignin: Biodegradation. June 1987-September 1989 (Citations from the Life Sciences Collection data base). Report for June 1987-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 57p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869003.

This bibliography contains citations concerning the biodegradation of waste cellulose, cellulose-containing substances, lignin, and lignin-containing substances. Attention is given to the organisms that decompose cellulose and lignin, and the processes by which this takes place. (This updated bibliography contains 120 citations, 46 of which are new entries to the previous edition.)

2301 (SAND–89-7036) **Loss minimization through recombination center identification.** Boeer, K.W.; Lu, Fu-Hsing. Sandia National Labs., Albuquerque, NM (USA); Delaware Univ., Newark, DE (USA). Dept. of Chemical Engineering. Oct 1989. 56p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE

Contract AC04-76DP00789. Order Number DE90001786. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The report contains a comparative evaluation of the finite element and the Kutta-Merson method by solving the same problems for a thin Si solar cell. Excellent agreement of the numerical results is shown. In the second part of the report, the Kutta-Merson method is used to investigate the influence of changing the charge character of a recombination center after the first carrier is trapped. Such change can result in a substantial change in open circuit voltage and fill-factor. The numerical results show that incorporation of usual recombination centers, which turn attractive to minority carriers when the first carrier is trapped, are detrimental to V_{oc}, and incorporation of sensitizing centers, which are doubly charged before recombination, are beneficial, that is, cause an increase of V_{oc} compared to neutral deep centers. The results indicate the need to incorporate a more refined recombination model in the finite element software. 15 refs., 18 figs., 7 tabs.

2302 (SAND–89-7039) **High-efficiency silicon concentrator solar cells for use with prismatic covers.** Culik, J.S.; Jackson, E.L. Sandia National Labs., Albuquerque, NM (USA); Astrosystems, Inc., Newark, DE (USA). Astropower Div. Oct 1989. 30p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE90002644. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Advanced-design 20X concentration silicon solar cells that are compatible with prismatic covers have been designed and fabricated. Our design is based upon a micro-machined, deeply grooved, three- dimensional silicon structure and incorporates a dual-layer emitter, oxide surface passivation layers for front and rear surfaces, and back surface reflector light-trapping technologies. Using "solar grade" Czochralski-grown silicon with a resistivity of 1.25 ohm-cm, we obtained open-circuit voltages as high as 679 mV and active-area current densities of up to 38.4 mA/cm^2. The best efficiency for a full-sized (50 cm^2) solar cell with prismatic cover is 17.8%. The performance of these devices is limited primarily by series resistance in the emitter and emitter contact due to the wide grid finger spacing (504 microns) and reflection from a groove ridgetop between the fingers. Increasing the density of front-contact fingers to eliminate the center ridge, together with a matched prismatic cover, will yield significant improvements in fill-factor and short-circuit current. Preliminary modeling of this design using PC-1D/2 indicates that efficiencies of up to 24% are feasible. With optimization of the fabrication sequence, the conversion efficiency of the deeply grooved concentrator solar cell should approach this level of performance.

2303 (SERI/STR–211-3410) **Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells: Phase 3 final subcontract report, February 1, 1986–January 31, 1987.** Carlson, D.E.; Ayra, R.R.; Bennett, M.S.; Brewer, J.A.; Catalano, A.W.; D'Aiello, R.V.; Dickson, C.R.; Fortmann, C.M.; Newton, J.L.; O'Dowd, J.G.; Oswald, R.S.; Wiedeman, S. Solar Energy Research Inst., Golden, CO (USA); Solarex Corp., Newtown, PA (USA). Thin Film Div. Sep 1989. 94p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89000846. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report present results of the third phase of research in high-efficiency, single-junction, monolithic, thin-film, a-Si solar cells. Six glow-discharge deposition systems, including an in-line multichamber system, were used to grow both doped and undoped a-Si films. In single load-lock system, a-Si was deposited over 1000- cm^2 substrates with less then a 1% variation in thickness and low oxygen impurity levels. The system produced 1000-cm^2 submodules with active-area efficiencies of 8.7%. A model was developed for light scattering in textured tin oxide that predicts scattered transmission through the air/glass/tin oxide/air configuration to within a few percent. Textured tin oxide films were grown by chemical vapor deposition using tin tetrachloride. Solar-cell efficiencies of about 11% were obtained in small-area p-i-n cells with reflective back contacts of Ti/Ag that exhibit external quantum efficiencies as high as 58.7% at 700 nm; other cells with ITO/Ag back contacts have had quantum efficiencies as high as 64% at 700 nm. High-performance cells were fabricated by employing dopant and carbon concentration gradients near the p/i interface. Total-area efficiencies around 8% were obtained for submodules in which the patterning was done by laser scribing. 11 refs., 35 figs., 18 tabs.

2304 (SERI/STR–211-3582) **Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells: Phase 1, Annual subcontract report, February 1, 1987–January 31, 1988.** Catalano, A.W.; Carlson, D.E.; Ayra, R.R.; Bennett, M.S.; D'Aiello, R.V.; Dickson, C.R.; Fortmann, C.M.; Goldstein, B.; McVeigh, J.; Morris, J.; Newton, J.L.; Wiedeman, S. Solar Energy Research Inst., Golden, CO (USA). Oct 1989. 142p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. ZB-7-06003-2. Order Number DE89009495. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

This document describes the progress made in obtaining stable, a-Si-based submodules that have a large area and high efficiency. Conversion efficiencies of up to 11.95% were obtained in small-area, single-junction a-Si solar cells using textured TiO_2, superlattice p-layers, graded carbon concentrations near the p/i interface, and highly reflective ITO/silver back contacts. Single- junction a-SiC and a-SiGe p-i-n cells were also fabricated that had conversion efficiencies of 9%–11%, and some recently fabricated stacked-junction cells had conversion efficiencies of about 10%. In materials research boron-doped microcrystalline SiC films were recently developed containing up to 6 at. % carbon with conductivities of $3 \times 10^{-3}/\Omega$-cm at room temperature and activation energies of 0.11 eV. Microcrystalline film growth was shown to be strongly influenced by the nature of the substrate, with nucleation occurring more readily on a-Si substrates than on TiO_2. Stability studies show that light-induced degradation is usually enhanced by the presence of carbon grading near the p/i interface. In general, adding either germanium (from GeH_4) or carbon (from CH_4) to the i-layer of a p-i-n cell leads to enhanced light-induced degradation. 13 refs., 80 figs., 17 tabs.

2305 (SERI/STR–211-3583) **Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells: Phase 2, Semiannual report, February 1, 1988–July 31, 1989.** Ayra, R.R.; Bennett, M.S.; Dickson, C.R.; Fieselmann, B.; Fortmann, C.; Goldstein, B.; Morris, J.; O'Dowd, J.G.; Oswald, R.S.; Wiedeman, S.; Yang, L. Solar Energy Research Inst., Golden, CO (USA). Oct 1989. 120p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009496. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This document describes efforts to improve the quality of candidate photovoltaic materials used in amorphous wide- and narrow-band-gap materials, namely, a-$Si_{1-x}C_x$ and a-$Si_{1-x}Ge_x$. Although these alloys show a decrease in mobility-lifetime product as the fraction of silicon decreases, their optical properties show marked differences. Microcrystalline p-layer films containing carbon were prepared to evaluate their importance for achieving high open-circuit voltages. Silicon-germanium cells were studied to optimize their performance in multijunction, stacked cell structures. The best cells fabricated from the silicon-germanium alloys yielded a conversion efficiency of 10.1% with a band gap of 1.55 eV. Several alloy-based stacked cells had conversion efficiencies of more than 10%: an a-SiC/a-SiGe cell yielded 10.5% and an a-SiC:H/a-Si:H structure yielded 10.2%. Stacked-junction cells showed far less susceptibility to light-induced degradation.

2306 (SERI/STR–211-3585) **High-efficiency large-area CdTe modules: Annual subcontract report, 1 July 1988–30 June 1989.** Albright, S.P.; Ackerman, B. Solar Energy Research Inst., Golden, CO (USA). Oct 1989. 32p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009498. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This annual technical progress report covers Photon Energy Inc. (PEI) work to produce a small solar cell with an efficiency of 12.3%. The high efficiency of this device was largely due to improving the window layer. Analyzing the diode characteristics of this cell indicates that the largest potential for fill-factor improvement lies in reducing the diode quality factor. Through outdoor life-testing of encapsulated modules and accelerated lifetesting of laboratory cells, the CdS/CdTe structure has demonstrated the long-term stability

necessary for photovoltaic products. Also described is a preformed metal backcap, which is fitted with hermetic feed-through tubes and used for encapsulization. Using the results of these studies, PEI produced sample modules with efficiencies very close to the original objectives, including a $l\text{-}ft^2$ module with an output of 6.1 W and an active area of 754 cm^2. For this module, the active-area efficiency was 8.1% and the aperture efficiency was 7.3%. 9 refs., 12 figs., 3 tabs.

2307 (SERI/STR–211-3586) **Thin film cadmium telluride, zinc telluride, and mercury zinc telluride solar cells: Annual subcontract report, 1 July 1988–30 June 1989.** Chu, T.L. Solar Energy Research Inst., Golden, CO (USA); University of South Florida, Tampa, FL (USA). Oct 1989. 31p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. XL-8-18091-1. Order Number DE89009499. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report covers the first year of a program to investigate (1) the deposition of CdTe films by various techniques, (2) the deposition of transparent conducting semiconductor (TCS) films by various techniques, (3) the preparation and evaluation of thin-film CdTe solar cells, and (4) the deposition and characterization of ZnTe films and heterojunctions. CdTe films were deposited on glass and SnO_2/glass substrates by metal-organic chemical vapor deposition (MOCVD) by reacting dimethylcadmium (DMCd) with diisopropyltellurium (DITe) in H_2. The optical bandgap was 1.50 eV. The conductivity type of the films could be controlled by controlling the DMCd/DITe molar ratio in the reaction mixture. This is a promising technique for the preparation of thin-film CdTe homojunction solar cells. CdS films were deposited from aqueous solutions by reacting thiourea and cadmium acetate in an ammonical solution. The films show good optical transmission in the above-bandgap region but are porous and impure. The photovoltaic characteristics of cells employing solution-grown CdS films are therefore inferior to those employing vacuum-evaporated CdS films. Films of ZnO, ZnS, and ZnTe were deposited, via MOCVD, on glass and SnO_2/glass substrates, and ZnO/ZnTe heterojunctions were produced. Open-circuit voltages of 0.6–0.7 V were measured for ZnS/ZnTe heterojunctions. 14 refs., 21 figs., 3 tabs.

2308 (SERI/TP–211-3595) **US polycrystalline thin film solar cells program.** Ullal, H.S.; Zweibel, K.; Mitchell, R.L. Solar Energy Research Inst., Golden, CO (USA). Nov 1989. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-891119–5: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE89009506. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Polycrystalline Thin Film Solar Cells Program, part of the United States National Photovoltaic Program, performs R&D on copper indium diselenide and cadmium telluride thin films. The objective of the Program is to support research to develop cells and modules that meet the US Department of Energy's long-term goals by achieving high efficiencies (15%-20%), low-cost ($50/$m^2$), and long-time reliability (30 years). The importance of work in this area is due to the fact that the polycrystalline thin-film $CuInSe_2$ and CdTe solar cells and modules have made rapid advances. They have become the leading thin films for PV in terms of efficiency and stability. The US Department of Energy has increased its funding through an initiative through the Solar Energy Research Institute in $CuInSe_2$ and CdTe with subcontracts to start in Spring 1990. 23 refs., 5 figs.

2309 (UCRL–21227-89) **Carbohydrate translocation and branch autonomy of Pinus ponderosa.** Houpis, J.L.J.; Benes, S.E. Lawrence Livermore National Lab., CA (USA). Mar 1989. 4p. Sponsored by University of California. DOE Contract W-7405-ENG-48. Order Number DE90001655. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We are testing the degree of mature branch autonomy in P. ponderosa using $^{14}CO_2$. Determination of the level of branch autonomy involves four elements that are based on pulsing one branchlet with $^{14}CO_2$: (1) determine if the canopy position of a branch in the canopy, of which one branchlet is pulsed with $^{14}CO_2$, affects the amount of $^{14}CO_2$ found in other types of tissue (stems, needles, buds) located on the same branch; (2) determine if the position (apical or lateral) of a branchlet that is pulsed with $^{14}CO_2$, affects the amount of $^{14}CO_2$ found in other tissue across different branchlets located on the same branch; (3) determine if the position of a branchlet in relation to the pulsed branchlet affect the amount of $^{14}CO_2$ that is traced into the target branchlet; and (4) determine if the length of time between pulsing and sampling of trace tissue affects the detection of $^{14}CO_2$. 2 refs.

2310 Low temperature diffusivity for aluminum and silver in amorphous silicon. Berry, W.B. (Notre Dame Univ., IN (USA)); Emery, K.A.; Swartzlander, A.B.; Nelson, A.J. pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC02-83CH10093. (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

This paper presents experimental results which determine the diffusivities for aluminum and silver in amorphous silicon using segments cut from test coupons and a fabricated module. The data extend the literature to a temperature range of 50^0C-300%C. The results agree with the relative order of magnitude of previously published work on aluminum over the temperature range of that data. The activation energy differs significantly.

2311 PC-1D version 2: Enhanced numerical solar cell modeling. . Basore, P.A. (Sandia National Labs., Albuquerque, NM (USA)); Rover, D.T.; Smith, A.W. pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC04-76DP00789. (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

PC-1D is a finite-element program for modeling semiconductor devices in one dimension on personal computers. Significant improvements have been made to the program, resulting in a new version. This paper describes the enhancements and their application to modern crystalline cells, including new provisions for heterostructures, anti-reflection coatings and light trapping, an upgraded user interface, and unattended operation for optimization studies.

2312 Useful life prediction for first generation a-Si photovoltaic modules using outdoor test data. Mrig, L.C. (Solar Energy Research Inst., Golden, CO (USA)); Berry, W.B. pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC02-83CH10093. (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

The design lifetime/performance goal for photovoltaic modules is 30 years. This paper presents an analysis of field test data for first generation a-Si modules under SERI's on-going field test and performance evaluation program. The program goal is to establish baseline data against which future development can be compared. To that end, models are discussed which represent the data and which begin to correlate basic cell and material studies to module field performance.

2313 Crystalline silicon photovoltaic cell technology: Meeting the challenge for utility power. . Arvizu, D.E. (Sandia National Labs., Albuquerque, NM (USA)). pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC04-76DP00789. (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

This paper discusses the recent progress in U.S. crystalline silicon photovoltaic cell technology for both one-sun and concentrating applications. The progress in crystalline silicon technology has manifested itself in improved efficiency and in lower costs of processing and production. The new developments in crystalline silicon photovoltaic technology have prompted an optimistic assessment of its potential for utility applications. The status of the current research efforts and the direction of the U.S. Department of Energy sponsored crystalline silicon research program is discussed.

2314 An empirical investigation of the InP shallow-homojunction solar cell. Wanlass, M.W. (Solar Energy Research Inst., Golden, CO (USA)); Gessert, T.A.; Emery, K.A.; Coutts, T.J. pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). DOE Contract

AC02-83CH10093. (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

In this paper an experimental study of the performance of epitaxially grown InP shallow-homojunction solar cells as a function of the thickness and carrier concentration in the base and emitter layers is presented. An identification of improvements to cell design leading to higher performance is emphasized. As a result, using a near-optimum set of design parameters, cells with conversion efficiencies of 20.3% (global) and 17.6% (AMO) have been achieved. Discrepancies between the results of the present study and earlier modeling efforts are also outlined.

2315 **High volume processing of point contact solar cells.** Miner, G.E. (SERA Solar Corp., Santa Clara, CA (US)); Christel, L.A. pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

Point contact solar cells have achieved the highest efficiencies recorded to data for silicon cells, reaching 28.2% at 10 Watts/cm^2, and have been shown to be capable of achieving efficiencies of over 30%. While this technology offers several advantages over conventional bifacial cells, it demands special process techniques to optimize cell efficiency. Point contact cells require a thin base, high bulk lifetime, low surface recombination velocities, effective light trapping, and effective heat sinking. This work addresses some of these production issues in implementing a point contact cell process using standard, high volume, semiconductor manufacturing equipment. Modifications to equipment and procedures are described which increase process yield and cell efficiency. Improvements are suggested which are expected to yield still higher efficiencies.

2316 **Safety considerations for high-efficiency crystalline-silicon solar cell fabrication.** Ruby, D.S. (Sandia National Labs., Albuquerque, NM (USA)). pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC04-76DP00789. (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

The fabrication of high-efficiency crystalline-silicon solar cells involves the use of hazardous chemicals which must be handled carefully and disposed of properly. This can be done in a facility that has been designed to minimize the probability of having an accident and which mitigates the damage of those that do occur. An analysis of such safety features is presented here for a facility designed to fabricate crystalline-silicon solar cells of the types shown to exhibit record-high efficiencies, both under concentrated and one-sun illumination. For comparison, the analogous safety measures that need to be taken in a thin-film solar cell production facility are also noted.

2317 **Hybrid solar cells based on DC magnetron sputtered films of n-ITO on APMOVPE grown p-InP.** Coutts, T.J. (Solar Energy Research Inst., Golden, CO (USA)); Li, X.; Wanlass, M.W.; Emery, K.A.; Gessert, T.A. pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

Hybrid indium tin oxide (ITO)/InP solar cells are discussed. The cells are constructed by DC magnetron sputter depositing ITO onto high quality InP films grown by atmospheric pressure metal organic vapor phase epitaxy. A record efficiency of 18.9%, measured under standard SERI reporting conditions, has been obtained. A discussion of associated quantum efficiencies and capacitance/voltage measurements is also presented from which it is concluded that further improvements in efficiency will result from better control over the type conversion process.

2318 **22.8% efficient silicon solar cell.** Blakers, A.W. (Solar Photovoltaic Laboratory, Joint Microelectronics Research Centre, University of New South Wales, Kensington 2033, Australia (AU)); Wang, A.; Milne, A.M.; Zhao, J.; Green, M.A. *Applied Physics Letters (USA)*, 55(13): 1363-1365 (25 Sep 1989).

A new silicon solar cell structure, the passivated emitter and rear cell, is described. The cell structure has yielded independently confirmed efficiencies of up to 22.8%, the highest ever reported for a silicon cell.

2319 **GaSb booster cells for over 30% efficient solar-cell stacks.** Fraas, L.M. (Boeing High Technology Center, Seattle, Washington 98124-6269 (US)); Girard, G.R.; Avery, J.E.; Arau, B.A.; Sundaram, V.S.; Thompson, A.G.; Gee, J.M. *Journal of Applied Physics (USA)*, 66(8): 3866-3870 (15 Oct 1989).

The fabrication of GaSb infrared-sensitive photovoltaic cells designed to boost the energy-conversion efficiency in tandem solar cell stacks is reported. Located behind GaAs solar-cells in 50× concentrated light configurations, these GaSb cells will boost the stack efficiency by 6.5 percentage points for space (AM0) and 7.0 percentage points for terrestrial (AM1.5D) applications. Assuming a GaAs cell efficiency of 26.7% (AM1.5D, 50×) as recently reported, the GaAs on GaSb stack efficiency will be 33.7%. Reduced series resistance in future GaSb cells will allow tandem-stack energy-conversion efficiencies over 35%.

2320 (N–89-27256) **Thermal evaluation of advanced solar dynamic heat receiver performance. Final report, January-December 1988.** Crane, R.A. University of South Florida, Tampa, FL (USA). Mar 1989. 131p. (NASA-CR–185117;NAS–1.26:185117). Available from NTIS, PC A07/MF A01.

The thermal performance of a variety of concepts for thermal energy storage as applied to solar dynamic applications is discussed. It is recognized that designs providing large thermal gradients or large temperature swings during orbit are susceptible to early mechanical failure. Concepts incorporating heat pipe technology may encounter operational limitations over sufficiently large ranges. By reviewing the thermal performance of basic designs, the relative merits of the basic concepts are compared. In addition the effect of thermal enhancement and metal utilization as applied to each design provides a partial characterization of the performance improvements to be achieved by developing these technologies.

2321 **Potential of advanced-design solar central receiver power systems.** Tracey, T.R. (Sandia National Labs., Albuquerque, NM (USA)); Tyner, C.E.; Weber, E.R. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

Criteria for the analysis, design, and operation of solar central receiver (SCR) power systems using molten salt working fluids have been developed based on many years of experience. Important among these criteria are eliminating high stresses in receiver tubes, minimizing trace heating and the number of valves, reducing system pressure, using simple and reliable pumps, simplifying control and startup, and minimizing scaleup risk. In this paper the authors discuss how a system using a falling film direct absorption receiver (DAR) and other advanced-design concepts may meet these criteria better than more conventional designs. In addition to the receiver, they examine potential areas for simplification and improvement in the areas of the steam generator system (SGS), trace heating, valves, pumps, and piping. They re-examine the potential benefits of system modularization, taking into account unique features of the DAR. Implementation of the many potential advanced-design concepts available from a DAR-based system will require substantial changes in conventional molten salt SCR designs. In this paper, they discuss the potential of these design changes and barriers to their implementation.

2322 **The economic potential of a photovoltaic central receiver power plant.** Menicucci, D. (Sandia National Labs., Albuquerque, NM (USA)); Kolb, G. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

The concept of a photovoltaic central receiver system has existed for about ten years, but was not seriously considered because of the high cost and marginal quality of the photovoltaic (PV) cells. Recent breakthroughs in PV cell efficiency and quality coupled with the design of low-cost heliostats have justified reconsideration of the concept. This paper compares the economic potential of a photovoltaic central receiver (PVCR) plant with molten salt central receivers and with a Fresnel lens photovoltaic concentrator system. The systems are compared by analyzing the costs and efficiencies of the subsystems and components. By applying a common set of economic assumptions, this information is used to estimate both installed and levelized energy costs for each of the systems. The paper also outlines some of the significant technical problems that must be solved before a PVCR system can be cost-effective. An experimental program designed to address these problems is described, and some preliminary results are presented.

2323 **Internal film receiver design and systems assessment.** Anderson, J. (Solar Energy Research Inst., Golden, CO (USA)); Buna, T. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

The internal film receiver (IFR) concept involves flowing a film of fluid (molten nitrate salt in this case) over one side of a sloped plate with concentrated solar radiation is focused on the other side. This paper documents a preliminary design study and system assessment effort carried out by the Solar Energy Research Institute. The project included a conceptual design engineering assessment and a systems analysis. The objective of this effort was to compare the IFR concept with conventional salt-in-tube receivers and with the direct absorption receiver (DAR). Major outputs from this effort included assessment of the performance and economic potential of the IFR and identification of the major technical issues associated with this concept. In general, the IFR concept displays many of the same technical advantages and technical issues anticipated for the DAR. The systems assessments results indicate that the IFR has the potential for levelized energy cost (LEC) reductions of 5%-8% over conventional salt-in-tube receivers.

2324 **Drop ejection in molten-salt direct absorption central receivers.** Bohn, M.S. (Solar Energy Research Inst., Golden, CO (USA)); Stern, C.H. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

Although the molten-salt direct absorption receiver concept promises significant improvements in central receiver system cost and efficiency, several technical issues remain before successful commercial implementation can be expected. One such issue is the possibility that the flowing molten-salt film can eject salt droplets into the area surrounding the receiver tower. This paper presents measurements of droplet ejection from a 5 m long by 0.27 m wide panel with a flowing film of molten nitrate sale. Measurements of the rate at which mass is ejected at various locations along the panel height were made for various flow rates and salt temperatures. Local measurements of film thickness were also made for various flow rates and salt temperatures. Besides quantifying the problem, the data suggest mechanisms for the droplet ejection phenomenon and possible methods to ameliorate the problem.

2325 **Improved operational performance of the Shenandoah Solar Total Energy Project.** Nelson, R.F. (Georgia Power Co., Shenandoah, GA (USA)); Heckes, A.A. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

This paper presents the results of selected design modifications to the Shenandoah Solar Total Energy Project (STEP) at Shenandoah, Georgia. The manpower required to operate the plant was significantly reduced, the loss rate of heat transfer fluid was slowed, and the system reliability improved so that the plant currently performs as originally intended. The items that brought about the improved operation include a new control system, a steam superheater, a larger boiler tube sheet, and a pressurized expansion tank for the heat transfer fluid. The aluminized film on five solar collectors was replaced with silvered film to improve the reflectivity and to field test its survivability.

2326 **Comparison of a cavity solar receiver numerical model and experimental data.** Hogan, R.E. (Sandia National Labs., Albuquerque, NM (USA)); Diver, R.B.; Stine, W.B. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

A numerical model which predicts the thermal environment in axisymmetric solar cavity receivers is described. The computed energy transfer rates and temperatures are compared to experimental data for tests of a novel test bed receiver in the Sandia National Laboratories solar furnace. In general, the numerical model captures the trends observed in the experimental data. Sensitivity analyses show that the total solar energy input rate and the convective heat loss coefficient have a significant effect on the thermal performance and that the input solar flux distribution has a significant effect on the receiver temperature distribution in these experiments.

2327 **Design considerations for heat-pipe solar receivers.** Adkins, D.R. (Sandia National Labs., Albuquerque, NM (USA)). pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

Heat pipes are being developed to transfer solar energy from the focal point of a parabolic dish concentrator to the working fluid of Stirling engines. With these receivers, concentrated solar energy that is absorbed on the concave surface of a dome is removed by the evaporation of liquid sodium on the convex side of the dome. Vaporized sodium then condenses on an engine's heater tubes and transfers energy to the working fluid of the engine. The condensed sodium returns to the absorber surface where it is redistributed across the dome by the capillary action of a wick. Issues concerning the flow of sodium in a heat-pipe solar receiver are investigated in this paper. A comparison is made between various wick options, and general issues concerning the design of heat pipe receivers are also discussed.

2328 **An assessment of the optical performance of stretched-membrane mirror modules.** Alpert, D.J. (Sandia National Labs., Albuquerque, NM (USA)); Houser, R.M. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

The United States Department of Energy's solar thermal program is developing an innovative concept for the heliostats used in a solar central-receiver power plant: replacing the familiar glass mirrors with stretched-membrane reflectors. This paper presents Sandia's assessment of first- and second-generation mirror modules made of stretched membranes. The first prototype mirror modules were built in 1986 by two contractors to Sandia. Sandia completed an evaluation of the optical performance of the two mirror modules in 1988. Using the experience gained with the first prototypes, and incorporating the results of Sandia's evaluation, the same two contractors designed improved stretched-membrane heliostats. A prototype of one design has been installed at the Central Receiver Test Facility, and Sandia's preliminary assessment shows the quality of its beam to be as good as current glass-mirror heliostats. The second prototype will be installed in early 1989.

2329 **Structural integrity studies of an external direct absorption solar central receiver.** Narayanan, T.V. (Foster Wheeler Corp., Livingston, NJ (USA)); Wu, S.F. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical

Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

In a joint SNL/SERI 3-year Direct Absorption Receiver (DAR) research and development program to determine concept feasibility, Foster Wheeler Solar Development Corporation conducted a design study of a commercial-size DAR. This paper summarizes the structural integrity considerations of that study. After extensive preliminary analyses and trade-off studies, an integral shell DAR design was adopted for the 320-MWt external receiver. Unlike the conventional tubular receiver, the major failure modes of concern in the DAR receiver are buckling and vibration. This problem was overcome by precompressed spring supports, which do not restrain the radially outward movement of the shell. The pretensioned bottom springs not only introduce a prestress in the shell, helping to counteract the compressive thermal stresses, but also help reduce wind-induced deflections and vibrations. Extensive large-displacement finite-element analyses were performed to evaluate the effect of varying critical design parameters such as shell thickness, pretension, length of spring, spring offset, and bottom ring beam sizes. This paper describes these analyses and the optimization of the various parameters.

2330 **Integration and optimization of the gas removal system for hybrid-cycle otec power plants.** Rabas, T.J. (Argonne National Lab., IL (USA)); Panchal, C.B.; Stevens, H.C. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract W-31-109-ENG-38. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

A preliminary design of the noncondensible-gas removal system for a 10 MWe, land-based, hybrid-cycle OTEC power plant has been developed and is presented herein. This gas removal system is very different from that used for conventional power plants because of the substantially larger and continuous noncondensible-gas flow rates and lower condenser pressure levels which predicate the need for higher-efficiency components. Previous OTEC studies discussed the need for multiple, high-efficiency compressors with intercoolers; however, no previous design effort was devoted to the details of the intercoolers, integration and optimization of the intercoolers with the compressors, and the practical design constraints and feasibility issues of these components. A computerized calculation method was developed for the performance analysis and subsystem optimization. For a specified number of compressor units and the stream arrangement, the method is used to calculate the dimensions, speeds, power requirements, and costs of all the components.

2331 **Operational experience of the OC-OTEC experiments at NELH.** Link, H. (Solar Energy Research Inst., Golden, CO (USA)). pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

The Solar Energy Research Institute, under funding and program direction from the U.S. Department of Energy, has been operating a small-scale test apparatus to investigate key components of an open-cycle ocean thermal energy conversion (OC-OTEC). The apparatus started operations in October 1987 and continues to provide valuable information on heat- and mass-transfer processes in evaporators and condensers, gas sorption processes as seawater is depressurized and repressurized, and control and instrumentation characteristics of open-cycle systems. This is the largest apparatus of its kind to use seawater since Georges Claude's efforts in 1926. The information obtained from experiments conducted in this apparatus is being used to design a larger scale experiment in which a positive net power production is expected to be demonstrated for the first time with OC-OTEC. This paper describes the apparatus, the major tests conducted during its first 18 months of operation, and the experience gained in OC-OTEC system operation.

2332 (DOE/SF/16306–18) **Colorado State University program for developing, testing, evaluating and optimizing solar heating and cooling systems: Project status report for the months of September and October 1989.** Colorado State Univ., Fort Collins, CO (USA). Solar Energy Applications Lab. Nov 1989. 18p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG03-86SF16306. Order Number DE90002536. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The objective is to develop and test various integrated solar heating, cooling and domestic hot water systems, and to evaluate their performance. Systems composed of new, as well as previously tested, components are carefully integrated so that effects of new components on system performance can be clearly delineated. The program for 1989-90 is separated into seven tasks. There are tasks for each of the three solar houses, a project to build and test several generic solar water heaters, a task involving development of an improved evacuated tube collector, a management task, and a task under which an international workshop will test IEA Task VI models. The objectives and progress in each task are described in this report. 2 figs.

2333 (ECN-PB–89-4) **Experiences with the application of a solar boiler on a camping-site in Sint Maartenszee, Netherlands.** Bakema, G.F.; Schuurman, J.J. Netherlands Energy Research Foundation, Petten (Netherlands). Jun 1989. 42p. (In (In Dutch)). Order Number DE90722428.

In 1987 a solar hot-water system, consisting of a flat-plate collector with an area of 99 m^2 and a 10,000 liter storage-tank, has been installed at camping-site Sint Maartenszee near the North Sea coast in North-Holland (the Netherlands). From April to September 1988 this system has been monitored by the Netherlands Energy Research Foundation (ECN). Descriptions are given of the camping-site, the sanitary, the solar boiler and the measuring setting up. The measuring results for the period April-September 1988 are presented. Then an evaluation is given of the working of the system during two totally different days as to the weather conditions. Finally it has been examined what energy yield can be realized by the system for optimal conditions. Also an economical evaluation has been given of the system in 1988 and of an improved system. 13 figs., 3 refs., 4 tabs., 1 app.

2334 **Space heating performance of the ghost ranch sundwellings.** Johnson, B.K. (Battelle Pacific Northwest Lab., Richland, WA (USA)); Kreider, J.F. pp. 515 of Proceedings of Solar 88, the 13th national passive solar conference. American Solar Energy Society, New York, NY (1988). (CONF-8806384–: 13. national passive solar conference, Cambridge, MA (USA), 20-24 Jun 1988).

Space heating performance of four buildings is presented. Solar radiation and temperature data were collected through a short-term monitoring program. A macrodynamic approach is used to extract building parameters from the data, with which long-term performance is determined. A particular macrodynamic method, Building Element Vector Analysis (BEVA), is demonstrated.

2335 **Determination and application of bidirectional solar-optical properties of fenestration systems.** Papamichael, K. (Lawrence Berkeley Lab., CA (USA)); Klems, J.; Selkowitz, S. pp. 515 of Proceedings of Solar 88, the 13th national passive solar conference. American Solar Energy Society, New York, NY (1988). DOE Contract AC03-76SF00098. (CONF-8806384–: 13. national passive solar conference, Cambridge, MA (USA), 20-24 Jun 1988).

Accurate determination of the luminous and thermal performance of fenestration systems that incorporate optically complex components requires detailed knowledge of their radiant behavior. The authors describe a large scanning radiometer used to measure the bidirectional transmittance and reflectance of fenestration systems and components. They present examples of measured data obtained for simple non-specular samples. They describe a method of obtaining the overall properties of fenestration systems by calculation from scanning radiometer measurements of fenestration components. Finally, they describe the application of bidirectional

solar-optical properties of fenestration system to determine their luminous and thermal performance with respect to building energy consumption and occupants' comfort. They also discuss the advantages and limitations of the method, which appears to be promising.

2336 Effect of non-absorbable gas on the performance of a falling film absorber for open-cycle absorption solar cooling system. Habib, H.M. (Arizona State Univ., Tempe, AZ (USA)); Wood, B.D.; Murthy, J.Y. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

Numerical solutions are presented for the effect of a non-absorbable gas on the heat and mass transfer rates during the absorption of water vapor by a falling laminar smooth films of an aqueous lithium bromide or aqueous lithium chloride solution (absorbent). The geometry consists of a vertical channel with two walls, one of which is isothermal and the other adiabatic. The liquid film of an absorbent flows down over the isothermal wall, while a mixture of water vapor and air flows between the liquid free-surface and the adiabatic wall. The whole system is kept under vacuum pressures. Water vapor is absorbed by the film and air is the non-absorbable gas. The momentum, energy, and concentration equations are written with a set of interfacial and boundary conditions and solved numerically for the two phases. Variable property effects are included, as well as the interfacial shear. Heat and mass transfer results are presented over a wide range of inlet air concentrations.

2337 Heat transfer and pressure drop measurements in an air/molten salt direct-contact heat exchanger. Bohn, M.S. (Solar Energy Research Inst., Golden, CO (USA)). pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

This paper presents a comparison of experimental data with a recently published model of heat exchange in irrigated packed beds. Heat transfer and pressure drop were measured in a 150 mm (ID) column with a 610-mm bed of metal Pall rings. Molten nitrate salt and preheated air were the working fluids with a salt inlet temperature of approximately 440^{0}C and air inlet temperatures of approximately 230^{0}C. A comparison between the experimental data and the heat transfer model is made on the basis of heat transfer from the salt. For the range of air and salt flow rates tested, 0.3 to 1.2 kg/m^2 s air flow and 6 to 18 kg/m^2 s salt flow, the data agree with the model within 22% standard deviation. In addition, a model for the column pressure drop was validated, agreeing with the experimental data within 18% standard deviation over the range of column pressure drop from 40 to 1250 Pa/m.

2338 Spectral model for instantaneous advanced window performance. Soule, D.E. (Solar Energy Research Inst., Golden, CO (USA)). pp. 515 of Proceedings of Solar 88, the 13th national passive solar conference. American Solar Energy Society, New York, NY (1988). (CONF-8806384–: 13. national passive solar conference, Cambridge, MA (USA), 20-24 Jun 1988).

A spectral model is developed for advanced windows with high spectral selectivity. The local instantaneous incident solar spectrum is introduced from the Bird and Riordan atmospheric parametric mode. Hemispherical spectral reflection from typical ground covers is added. A series of advanced double-pane windows including the vacuum window is investigated with spectral selectivity and transmittance half-width. The influence of spectrally selective low-E (SSLE) films is emphasized. Performance of vertical windows facing N, S, E, W is evaluated for specific window tasks: daylighting, ultraviolet load avoidance, summer cooling load avoidance, and winter solar heating. Typical day 24 hour integrations of the window's net energy throughput are projected to establish overall seasonal window performance.

2339 Field survey of 259 active solar DHW systems. Carlisle, N. (Solar Energy Research Inst., Golden, CO (USA)); Farrington, R. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

To obtain information on the reliability of active solar domestic water heating (SDHW) systems installed since 1985, the Solar Energy Research Institute (SERI) contracted with local organizations to perform site inspections and collect repair data from homeowners in 4 geographic locations. This paper provides data resulting from 259 site inspections and homeowner surveys. Survey results are presented on system types, installation quality, problems identified by component, system repair costs and incidence of repair. A significant result of this study is that it did not reveal systematic failures of particular components. The major problems were ones common to all types of solar systems and not a result of particular system designs.

2340 Facilities for testing desiccant materials and geometries of dehumidifiers for solar-regenerated desiccant cooling systems. Pesaran, A.A. (Solar Energy Research Inst., Golden, CO (USA)); Bingham, C.E. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

Four experimental test facilities for characterizing the performance of solid desiccant materials and dehumidifier matrices which have the potential to be used in solar-regenerated desiccant cooling systems are reviewed. The water equilibrium capacity and sorption rates of desiccant materials, depending on their form, can be either measured with a quartz crystal microbalance or a desiccant sorption test facility. Pressure drop, heat- and mass-transfer rates and transient equilibrium dehumidification capacity of a dehumidifier matrices are measured in a desiccant heat and mass transfer test facility. The performance and steady state dehumidification capabilities of prototype dehumidifier components under realistic conditions are measured in a desiccant cyclic test facility. The description of the test apparatus, experimental procedure, measurement errors, and typical results for the four test facilities are presented here.

2341 Measurement uncertainty of adsorption testing of desiccant materials. Bingham, C.E. (Solar Energy Research Inst., Golden, CO (USA)); Pesaran, A.A. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

The technique of measurement uncertainty analysis as described in the current ANSI/ASME standard is applied to the testing of desiccant materials in SERI's Sorption Test Facility. This paper estimates the elemental precision and systematic errors in these tests and propagates them separately to obtain the resulting uncertainty of the test parameters, including relative humidity (+-.03) and sorption capacity (+-.002 g/g). Errors generated by instrument calibration, data acquisition, and data reduction are considered. Measurement parameters that would improve the uncertainty of the results are identified. Using the uncertainty in the moisture capacity of a desiccant, the design engineer can estimate the uncertainty in performance of a dehumidifier for desiccant cooling system with confidence.

2342 Window 3.1: A computer tool for analyzing window thermal performance. . Reilly, S. (Lawrence Berkeley Lab., CA (USA)); Arasteh, D. pp. 515 of Proceedings of Solar 88, the 13th national passive solar conference. American Solar Energy Society, New York, NY (1988). (CONF-8806384–: 13. national passive solar conference, Cambridge, MA (USA), 20-24 Jun 1988).

WINDOW 3.1 is a public-domain computer program developed by the Windows and Daylighting Group at Lawrence Berkeley Laboratory for analyzing heat transfer through window systems. The program uses an iterative technique to calculate the one-dimensional temperature profile across a user-defined window system. From this data, window system performance indices (e.g., U-value, shading coefficient) are calculated. WINDOW 3.1, a major update to WINDOW 2.0, incorporates several technical additions and many new user-friendly features, and provides a consistent and versatile means for heat transfer analysis as did WINDOW 2.0.

WINDOW 3.1 can vary environmental conditions, window tilt, number of glazing layers, layer properties (thermal infrared, solar and visible optical properties, and thermal conductance), gap widths, composition of gap gas fill, and spacer and frame materials. This paper presents an overview of the computational methodology, describes the capabilities of the program, and discusses the applications of WINDOW 3.1 for standardizing window heat transfer calculations and in designing new insulating window systems.

2343 **Short-time-scale measurements of fenestration thermal performance under realistic springtime conditions.** Klems, J.H. (Lawrence Berkeley Lab., CA (USA)); Keller, H. pp. 515 of Proceedings of Solar 88, the 13th national passive solar conference. American Solar Energy Society, New York, NY (1988). (CONF-8806384–: 13. national passive solar conference, Cambridge, MA (USA), 20-24 Jun 1988).

The thermal performance of several simple fenestrations closely approximating the assumptions of ASHRAE heat-transfer calculation model was measured in both south-facing and north-facing orientations under realistic field conditions using the new MoWiTT field test facility. The time-dependent net heat flow through each fenestration was found to be consistent with the predictions of the model, provided that an angle-dependent solar factor was used and diffuse solar gain was included in the calculation. Summer-condition average U-values were derived for each glazing type and were found to agree with the expected values for both clear and low-emissivity double glazing. The measured U-value for single glazing was lower than predicted.

2344 **Metal substrates and the photodegradation of polymers. Pt. 2. An FTIR study of polyethylene terephthalate and polyvinyl fluoride.** Smith, D.M. (Denver Univ., CO (USA). Dept. of Chemistry); Welch, W.F.; Graham, S.M.; Chughtai, A.R.; Schissel, P. *Solar Energy Materials (Netherlands),* 19(1/2): 111-120 (Sep 1989). Grant MPS-75-0620;ATM-83-00524. (CONF-8708236–: 6. conference on optical materials technology for energy efficiency and solar energy conversion, San Diego, CA (USA), 18-19 Aug 1987).

The effect of several metal substrates (Al, Cu, Ag, and Au) on the photodegradation of polyethylene terephthalate (PET) and polyvinyl fluoride (PVF) films has been examined. The effect of M on M/PET systems under both oxidative and non-oxidative conditions shows that the orders of photodegradation are: Cu/PET>>Al/PET>PET>Au/PET>Ag/PET (non-oxidative) and Cu/PET>>PET>Al/PET>Au/PET>Ag/PET (oxidative). The effect of M on M/PVF films when irradiated under non-oxidative conditions shows that all metals have an adverse effect on the photodegradation of these films. Under oxidative conditions, Cu/PVF shows extreme photodegradation while the other M/PVF films show far less photodegradation than under the non-oxidative conditions. The trends in photodegradation are as follows: Al/PVF>>Cu/PVF>Au/PVF>Ag/PVF>PVF (non-oxidative) and Cu/PVF>>PVF>Al/PVF>Au/PVF>Ag/PVF (oxidative). (orig.).

1410 Solar Collectors and Concentrators

Refer also to citation(s) 2313

2345 (DTH-LV–87-11) **Plastic foil absorbers for solar collectors.** Oestergaard Jensen, S. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varmeisolering. Aug 1987. 40p. (In Danish). Order Number DE90719270. Available from NTIS (US Sales Only), PC A03/MF A01.

A solar absorber made of transparent foils consisting of a polyamide and polyethylene laminate was investigated. Because of the transparency of the layers, the fluid between them is absorbant and, in this case, runs between them. It was shown that the laminate could not sufficiently withstand the sun's ultraviolet rays, but it could possibly be utilized in connection with solar collecters without a protective covering (for example where they are used to heat swimming pools) because in this case the stagnation temperature does not present a problem. It was proved possible to achieve a satisfactory flow profile regarding the fluid running between the plastic foil layers. It was concluded that economically these foils may not be able to compete with absorbers made of metal because of the problems related to ultraviolet radiation. (AB).

2346 (ETDE-mf–0721861) **Radiation-physical properties of selective solar absorbers.** Gindele, K.J. Stuttgart Univ. (Germany, F.R.). Fakultaet 4 - Elektrotechnik. 22 Jun 1988. 117p. (In German). Order Number DE90721861. Available from NTIS (US Sales Only), PC A06/MF A01.

An optical measurement method is presented which allows to measure the radiation-physical properties of surfaces, especially of selective solar radiation absorbing layers, both as spectral and as total radiation quantity and to cover both the solar and the thermal radiation range. In detail, the report deals with selective layers and their characterization as well as with radiation-physical quantities and measurements of radiation-physical properties (radiometry, backscatter method, thermal and spectral measurements). Furthermore, details are given about the spectrometer (optics, noise) and the measurements of the spectral emissivity in the infrared range by means of the backscatter method, as well as about characteristics of the IR backscatter technique. Finally, applications of the measurement techniques and results are presented (contribution to the understanding of the interaction between electromagnetic radiation and matter in the case of metal/dielectric layers as well as rough surfaces). (HWJ).

2347 (NEI-DK–225) **Development of solar collector modules.** Forman, T.; Christensen, H.J. Aidt Miljoe, Hadsten (Denmark). Mar 1989. 24p. (In Danish). Order Number DE90719264. Available from NTIS (US Sales Only), PC A03/MF A01.

Description of 3 solar collector modules, a self-circulating, low-flow and a larger 12m2 module, initiated by Denmark's Technical University in collaboration with Esbensens, The Danish firm of consulting engineers. The article also provides an explanation of construction methods, installation instructions, and a discussion of performance efficiency and properties of the materials utilized. Diagrams illustrate the text. (AB).

2348 **Optical properties of one and two-stage concentrator systems with non-paraboloidal and non-axisymmetric primaries.** O'Gallagher, J. (Chicago Univ., IL (USA)); Winston, R.; Lewandowski, A. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

A two-stage maximally concentrating optical system consists of a point focus primary combined with an optimized nonimaging secondary of the CPC or "trumpet" type. In previous work, such configurations have been shown to have significant advantages over conventional single stage designs for solar thermal applications. In this work, an optical and thermal model for the analysis of point focus thermal concentrators with and without secondaries has been generalized and improved. The main feature of the improved model is a procedure for tracing rays reflected off surfaces whose radial profile is not analytic, but instead is defined by discreet point co-ordinates. This new technique for analyzing arbitrary, well behaved, optical shapes, uses a cubic spline interpolation procedure and a modified Newton-Raphson method to trace a large number of rays reflected off the primary. It provides a versatile method for studying a variety of primary shapes.

2349 **Maintenance of brine transparency in salinity gradient solar ponds.** Hull, J.R. (Argonne National Lab., IL (USA)). pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract W-31109-ENG-38. (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

Experience with maintenance of brine transparency during the more than eight years of operation of the 1000-m^2 Research Salinity Gradient Solar Pond (RSGSP) at Argonne National Laboratory suggests that, in many sodium chloride brines, algal growth may be readily curtailed by minimizing the phosphate content of the brine. The addition of modest amount of aluminum sulfate (< 5 g m^{-2} yr^{-1}) to precipitate soluble phosphate in the RSGSP has resulted in a reduction of the amount of chlorine used from 13 g m^{-2} yr^{-1} to 2.8 g m^{-2} yr^{-1}, while still maintaining good transparency in the pond brine.

2350 **LANSIR: An instrument for measuring the light-scattering properties of laminate membrane mirrors.** . Wendelin, T.J. (Solar Energy Research Inst., Golden, CO (USA)); Wood, R.L. pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

This paper describes a large aperture, near-specular imaging reflectometer, (LANSIR), designed and built for performing optical surface quality tests on laminate mirror specimens. LANSIR can quantify the extent of reflective light-scattering from the surface of mirrors whose radii of curvature range from infinite (i.e., flat) down to approximately 15m in length. LANSIR has been used to investigate metalized polymer film reflective surfaces laminated to structural metal, polymer, and composite material substrates such as those used in stretched-membrane heliostats and dishes. Mirror samples from DOE-sponsored membrane heliostat and dish research and development efforts have exhibited scatter within the acceptable limits for moderate temperature applications as determined by solar thermal systems analyses. In addition, prolonged membrane stress appears to have little effect on the light-scattering properties of these samples. Using LANSIR to study the near-specular scattering properties of these mirrors, the authors have pointed out the need for continued attention to new materials and to new forming and joining processes for membrane mirrors.

1420 Heat Storage

Refer also to citation(s) 2566

2351 (CTH-JVG–27) **Sunclay clay plant at Kungsbacka. Technical follow-up of the thermal storage.** Rhen, I. Chalmers Inst. of Tech., Goeteborg (Sweden). Earth Heat Pump Group. May 1988. 46p. (In Swedish). Order Number DE90719416. Available from NTIS (US Sales Only), PC A03/MF A01.

The Lindaelv school at Kungsbacka is supplied with solar heating from a system with heat pumps and a heat storage in clay. The storage is arranged on post-glacial clay which contains sulfide and shell rests at some levels and is slightly overconsolidated. The heat storage consists of 612 U-tubes of PEH, arranged vertically to a depth of 35 m below the ground surface. Totally installed tube length is 42000 m and the distance between tubes c. 2 m. The storage occupies a ground area of 38x65 m^2, which supplies a storage volume of 87000 m^3. The mean temperature of the heat storage increased from c. +8 deg C in 1980 to c. +12 deg C in 1984. During 1984 the lowest and highest mean temperature of the storage was 9 deg C and 15 deg C respectively. Because of the low hydraulic conductivity of the clay the water expansion in the storage causes an increased pore water pressure and a ground heaving.

2352 (DTH-LV–88-18) **Pilot project for a larger solar heating system with seasonal heat storage. Further documentation of borehole storage yield and economy.** Andersen, S.; Ussing, V. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varmeisolering. Oct 1988. 29p. (In Danish). Order Number DE90718971. Available from NTIS (US Sales Only), PC A03.

Further documentation of borehole heat storage yield and economy in connection with seasonal heat storage for terrace houses with a collective solar heating system. The system was found to be considerably cheaper than other heat storage methods. The energy flow showed a heat loss throughout 4 years of 14% where a heat pump was utilized and about 30% without the use of a heat pump. When it is possible that the boreholes reach a greater depth, the heat loss is less. It is considered that a mixture of sand, fly ash and water used to surround the underground tubes in the boreholes increases heat conducting capacity. The construction of the boreholes is described. A number of illustrative charts and graphs are also presented. (AB).

15 GEOTHERMAL ENERGY

1505 Economic and Financial Aspects

Refer also to citation(s) 2353, 2647

1508 Geothermal Power Plants

2353 (DOE-tr–89-18) **On economics of hot dry rock geothermal power station.** USDOE, Washington, DC (USA). 1989. 30p. Translation source information not available. Sponsored by U.S. DOE Management & Administration. Order Number DE90002697. Available from NTIS, PC A03/MF A01 - OSTI.

In order to clarify resources and economics of hot dry rock geothermal power stations in Japan, the Hot Dry Rock Geothermal Power Station Cost Study Committee was established. The Committee made a standard hot rock model based on Japanese geothermal core structures, drilling technology, and hydraulic fracturing technology with various investigations and estimated overall cost of the geothermal power station.

2354 (EGG-EP–8708) **Aspects of the Kalina technology applied to geothermal power production.** Bliem, C.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). 21 Sep 1989. 63p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE90002028. Available from NTIS, PC A04/MF A01 - OSTI.

This report contains the results of studies conducted at the Idaho National Engineering Laboratory (INEL) concerning the applicability of the Kalina technology to geothermal (hydrothermal) power production. This report represents a correction and addition to that report. The Heat Cycle Research Program (HCRP) has as its primary goal the cost-effective production of electric power from moderate temperature hydrothermal resources. Recent work has included the study of supercritical cycles with counterflow condensation which utilize mixtures as working fluids. These advanced concepts are projected to give a 20 to 30% improvement in power produced per unit geofluid flow rate (geofluid effectiveness, w hr/lb). The original Kalina cycle is a system which is similar to the cycles being studied in the Heat Cycle Research program and it was felt that this new cycle should be studied in the geothermal context. 15 refs., 9 figs., 2 tabs.

1509 Geothermal Engineering

Refer also to citation(s) 2353, 2359, 2360

2355 (LBL–26612-Vol.1) **The Ahuachapan geothermal field, El Salvador: Reservoir analysis: Volume 1, Text and main figures.** Aunzo, Z.; Bodvarsson, G.S.; Laky, C.; Lippmann, M.J.; Steingrimsson, B.; Truesdell, A.H.; Witherspoon, P.A. Lawrence Berkeley Lab., CA (USA). Aug 1989. 201p. Sponsored by U.S. Agency for International Development; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90003119. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

The Earth Sciences Division of Lawrence Berkeley Laboratory (LBL) is conducting a reservoir evaluation study of the Ahuachapan geothermal field in El Salvador. This work is being performed in cooperation with the Comision Ejecutiva Hidroelectrica del Rio Lempa (CEL) and the Los Alamos National Laboratory (LANL). This report describes the work done during the first year of the study (FY 1988–89), and includes the (1) development of geological and conceptual models of the field, (2) evaluation of the initial thermodynamic and chemical conditions and their changes during exploitation, (3) evaluation of interference test data and the observed reservoir pressure decline, and (4) the development of a natural state model for the field. The geological model of the field indicates that there are seven (7) major and five (5) minor faults that control the fluid movement in the Ahuachapan area. Some of the faults act as a barrier to flow as indicated by large temperature declines towards the north and west. Other faults act as preferential pathways to flow. The Ahuachapan Andesites provide good horizontal permeability to flow and provide most of the fluids to the wells. The underlying Older Agglomerates also contribute to well production, but considerably less than the Andesites. 84 refs.

2356 (LBL–26612-Vol.2) **The Ahuachapan geothermal field, El Salvador: Reservoir analysis: Volume 2, Appendices A through E.** Aunzo, Z.; Bodvarsson, G.S.; Laky, C.; Lippmann, M.J.; Steingrimsson, B.; Truesdell, A.H.; Witherspoon, P.A. Lawrence Berkeley Lab., CA (USA). Aug 1989. 426p. Sponsored by U.S. Agency for International Development; U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002528. Available from NTIS, PC A19/MF A01 - OSTI; GPO Dep.

These are appendices A thru E of the Ahuachapan geothermal field reservoir analysis. The volume contains: mineralogy contours, ionic chlorine and silicon dioxide contours, well summaries, and temperature and pressure effects. (JEF)

1510 Direct Energy Utilization

2357 (EGG-M–88264) **Geothermal direct use projects in the United States: Status and trends.** Lunis, B.C.; Lienau, P.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. (CONF-881013–5: JIGASTOCK '88: international conference on applied geothermal energy and thermal energy storage, Versailles (France), 18-21 Oct 1988). Order Number DE90002012. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Prior to about 1973, geothermal most direct use projects in the United States involved pool/spa applications and limited district and space heating systems. The oil price shocks of the 1970's revived interest in the use of geothermal energy as an alternative energy source. Accordingly, the US Department of Energy initiated numerous programs that caused significant growth of this industry. These programs involved technical assistance to developers, the preparation of project feasibility studies for potential users, cost sharing of demonstration projects (space and district heating, industrial, agriculture, and aquaculture), resource assessments, loan guarantees, support of state resource and commercialization activities, and others. Also adding to the growth were various federal and state tax credits. The use of groundwater-source heat pumps contributed to the growth, starting in 1980. The growth of direct use project development was quite closely monitored during the late 1970's and early 1980's when the USDOE program activities were extensive. Periodic updating of the status of the projects has been occasional but limited since that time. In order to obtain a better understanding of the current geothermal direct use market, the Oregon Institute of Technology Geo-Heat Center (OIT), under contract to the US Department of Energy, launched an extensive data-gathering effort in the spring of 1988. The results of that effort are incorporated into this paper. The Idaho National Engineering Laboratory (INEL) (also funded by the Department of Energy) and OIT, through their continuing contacts with the geothermal industry, including state energy offices, are familiar with development trends and concerns; this information is also presented. 3 tabs.

1520 Geothermal Data and Theory

2358 (DOE/ER/13711–1) **Anisotropic yielding of rocks at high temperatures and pressures: Technical progress report No. 1, April 15, 1987–April 14, 1988.** Kronenberg, A.K.; Russell, J.E.; Handin, J.; Gottschalk, R.R.; Shea, W.T. Texas A and M Univ., College Station, TX (USA). Center for Tectonophysics. Dec 1987. 44p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER13711. Order Number DE90003047. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Results to date are: All of the starting materials for the three year project have been collected. Included in our collection are relatively fine-grained, fresh, oriented blocks of schist, gneiss, and micaceous quartzite with well-defined foliations and lineations as well as granite blocks oriented with respect to the principal quarrying orientations, the rift, grain, and hardway. A suite of samples has also been collected from an exposed granite stock and surrounding country rocks in order to evaluate the strengths and distribution of fabrics which may be encountered while drilling. These fabrics appear to be directly related to the forceful emplacement of the pluton. The literature on the mechanics of intrusion has been reviewed with regard to strain gradients and foliation development associated with diapiric flow. This information will be used to evaluate flow of varying fabrics on yield criteria within and surrounding magma chambers. Twenty-three successful experiments have been performed on samples of gneiss cored along six different orientations at temperatures ranging from 25° to 700°C. These experiments include extension tests, unconfined compression tests, and compression tests performed at P_c = 100 MPa. Theoretical yield conditions for anisotropic materials have been reviewed and the assumptions upon which they are based probed. These yield conditions will ultimately be used to fit our data on gneiss, and the other foliated rocks under investigation. Two abstracts have been published and oral presentations made at the 1987 Fall Meeting of the American Geophysical Union, based upon our previous DOE-sponsored work on tensile fracturing of quartzite and related work on semi-brittle deformation of granitic rocks. 21 refs., 12 figs., 2 tabs.

2359 (ETDE-mf–0717911) **Reactions and interactions of the reservoir rock with heat exchange media in the hot dry rock process: A case study in the Falkenberg granite.** Althaus, E.; Herold, G. Karlsruhe Univ. (T.H.) (Germany, F.R.). Mineralogisches Inst. [1985]. 31p. (In German). BMFT 03E-6077-A. Order Number DE90717911. Available from NTIS (US Sales Only), PC A03/MF A01.

Mineral and rock, which are the energy carriers of heat storage in hot dry rock systems (HDR), do not behave chemically inertly towards aqueous heat exchange media. Solid-liquid-reactions, which take place in such systems, on the one hand, load the fluids with dissolved substances and, on the other hand, change the rock surfaces serving for the heat exchange. These conditions were investigated by systematic parameter variations in a rock complex with the aim to study the effect and significance of chemical processes in the framework of the overall system. The principal minerals of a granite (quartz, alkali feldspar, plagioclase, biotite) as well as the interaction of several solids (mineral combination) and the reaction conditions (temperature, pH value, concentration of solution, acidity influence, time dependence) were investigated. Conclusions are drawn for the installation and operation of an HDR system in granite. (HWJ).

2360 (SAND–89-0567) **Magma energy extraction: Annual report for FY88.** Dunn, J.C. (ed.). Sandia National Labs., Albuquerque, NM (USA). Aug 1989. 58p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. Order Number DE90002627. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Thermal energy contained in magmatic systems represents a huge potential resource. In the US, useful energy contained in molten and partially-molten magma within the upper 10 km of the crust has been estimated at 50,000 to 500,000 Quads. The objective of the Magma Energy Extraction Program is to determine engineering feasibility of locating, accessing and utilizing magma as a viable energy resource. Engineering feasibility will depend on size and depth of the resource; extraction rates; and material life times. 11 refs., 29 figs., 1 tab.

2361 (RISO-R–568) **Meteorology and Wind Energy Department annual progress report 1 January - 31 December 1988.** Petersen, E.L.; Skrumsager, B. (eds.). Risoe National Lab., Roskilde (Denmark). May 1989. 48p. Order Number DE90718922. Available from NTIS (US Sales Only), PC A03/MF A01.

The research in the Meteorology and Wind Energy Department is directed towards two major applications: wind energy and modelling air pollution dispersion. In order to maintain a high level of technical competence within these applications, the department has carried

out both theoretical and experimental basic studies. The subjects range from surface energy balance research of the general spatial and temporal structure of atmospheric turbulence to wind engineering investigations of dynamic loads on buildings, bridges, and other structures. Very important parts of the applied work are the testing and licensing of wind turbines for the Danish market and providing consultative services for Danish wind turbine manufactues. (author).

Stall-regulation for medium scale wind turbine generators has been studied. The study scope included design and construction of a rotor for installation on the existing MS2 wind turbine generator (WIG) at Ilfracombe. Certain advantages and technical uncertainties associated with stall-regulation have been investigated. Blade design is discussed and the monitoring during commissioning, operation of the rotor, and overspeed protection testing, are reported. (author).

2363 (ETSU-WN–5098) **Adaptive pitch control for power regulation of the MS-2 wind turbine.** Wind Energy Group Ltd., Southall (UK); Department of Energy, London (UK); UKAEA Harwell Lab. (UK). Energy Technology Div. 1989. 107p. (WEG-T–4119). Order Number DE90722759. Available from NTIS (US Sales Only), PC A06/MF A01.

The effectiveness of a previously developed advanced control algorithm, when incorporated into the control system of an actual wind turbine, has been investigated. The purpose of the control algorithm was to improve the action of the pitch control system of a constant speed, full span pitch regulated wind turbine. The pitch control system is used to limit the power output in high winds. The work involves: (a) specifying and selecting an appropriate microprocessor based hardware system on which to implement the control algorithm; (b) programming the new system to enable it to carry out all the functions of the old controller safely and reliably, and installing, commissioning and testing it on the MS2 wind turbine near Ilfracombe, Devon; (c) programming the new system with the new control algorithm, after modifying it to cope with various constraints imposed by the hardware; and (d) testing and monitoring the performance of the new algorithm, analysing the results, and using them to develop and improve the algorithm. (author).

Draft project.** Hoffmann (H.) og Soenner A/S, Gentofte (Denmark); Havnecon Consulting A/S, Lemvig (Denmark); Vind-Syssel A.M.B.A., Jerslev (Denmark). May 1989. 83p. (In Danish). Order Number DE90718986. Available from NTIS (US Sales Only), PC A05.

A feasibility study produced by a Danish firm that manufactures windmills, an entreprenour/civil engineering firm, and a consulting civil engineering firm in collaboration, relating to the possible construction of a wind turbine array on an offshore site. The geological, wave force and ice conditions are investigated and the construction proceedures are described in detail. A cost-benefit analysis is presented and a detailed description of the wind turbines design has been contributed by the manufacturer in question. The text is illustrated with diagrams, maps, tables and charts. (AB).

IEA, R and D, WECS.

As part of the joint action on Aerodynamics, which is one of the activities covered by Annex XI to the IEA; R and D, WECS implementing agreement, a two day symposium on the Aerodynamics of Wind Turbines has been organized. These proceedings are the outcome of this second symposium, which was held in Denmark 21. and 22. November 1988. The symposium was attended by 20 researchers from 7 of the signatory countries, and 15 presentations were given. The attendance was restricted to people actively doing research within the field, hence assuring active participation in the presentations and discussions. In the invitation to the symposium the following topics were suggested, calculational methods and experimental results for rotors in yaw, new airfoil sections, status and prospects and 3-d flow through rotors. Calculational methods and experimental results, flow at or near stall conditions in particular. It was apparent, that the first topic was of most interest, and that several parties were going to embark on projects addressing that problem. It was agreed that participating institutions should try to inform each other on ongoing and planned projects, in order to enhance coordination and collaboration. (AB).

(CONF-8811284–: 2. symposium on aerodynamics of wind turbines, Lyngby (Denmark), 21-22 Nov 1988). In *Joint action on aerodynamics of wind turbines*. Order Number DE90719162. Available from NTIS (US Sales Only), PC A12.

IEA, R and D, WECS.

In the paper the problem of determining the influence of rotation on the boundary layer of blades of wind turbines is addressed. To distinguish this problem from other factors which may alter the airfoil characteristics, we assume the blade be infinite and the inflow steady. In fact, such a problem is not feasible in nature, but can be treated analytically or numerically on a computer. Equations defining the mathematical problem are shown, and some physical interpretations of the terms which may alter the two-dimensional characteristics of airfoils submitted to rotation are given. A rotating flat plate and a blade rotating with constant incidence on which the boundary layer everywhere is separated from the upper surface are analytically investigated. A brief description of mathematical and numerical features of the boundary layer equations in order to establish the basis for general viscous-inviscid calculation procedures is given. Finally, a short description and some results of the viscous-inviscid interaction model developed by the author (Soerensen, 1986) is presented. (AB) 32 refs.

2367 (NEI-DK–221, pp. 38-55) **Actuator disc edge singularity. The key to a revised actuator disc concept and momentum theory.** Kuik, G.A.M. van (The Wind Energy Group of the Technical University Eindhoven (NL)). Danmarks Tekniske Hoejskole, Lyngby (Denmark). Afdelingen for Fluid Mekanik; International Energy Agency, 75 - Paris (France). 1989. (CONF-8811284–: 2. symposium on aerodynamics of wind turbines, Lyngby (Denmark), 21-22 Nov 1988). In *Joint action on aerodynamics of wind turbines*. Order Number DE90719162. Available from NTIS (US Sales Only), PC A12.

IEA, R and D, WECS.

Since the beginning of rotor aerodynamics the actuator disc momentum theory occupies a prominant place in almost any textbook on this subject. Specially in axial flow the theory provides an easy and rather accurate performance prediction. The results first obtained by Lanchester for the induced power of a hovering rotor and the maximum power of a wind turbine are still used as guidelines for complicated calculations. On the other hand, experimental results for propellers are known to deviate systematically (some 10%) from the momentum theory results. This is commonly attributed to the differences between a real rotor and an actuator disc. However, some actuator disc- and actuator strip (the 2-dimensional version) experiments are described in literature, showing the same deviations from momentum theory results. Therefore, apart from the question how representative an actuator disc is for a real rotor, the actuator disc concept itself may be inadequate. This problem is the subject of the work describe here. It will be shown that the classical actuator disc concept ignores discrete forces resulting from a flow singularity at the edge of the disc. The (extended) momentum theory, applied to this actuator strip model, shows a shift of the results

towards the experimental data, and for the static case (hover) even a quantitative agreement is obtained. (author) 12 refs.

2368 (NEI-DK–221, pp. 56-70) **Performance methods (again—).** Montgomerie, B. (The Aeronautical Research Institute of Sweden (SE)). Danmarks Tekniske Hoejskole, Lyngby (Denmark). The possibilities are examined of being able to continue using the type of method for performance/force calculation that is now generally being applied, with modifications. The attraction in blade element/momentum theory lies in the simplicity and speed of calculation. This should be viewed in comparison with vortex wake representation, which take up considerable computer time. The measurements were conducted in a low speed wind tunnel at KTH, The Royal Institute of Technology, in Stockholm. The models had a diameter of 25 cm suggesting that extreme care should be taken when Reynold's number (Re) effects are important and the data is to be used for larger machines. The shaft torque was absorbed by a small generator with a controllable dump load device allowing the desired RPM and/or power extraction. In the cases studied here the power coefficient was about 0.35. The wake was traversed with hot wire probes allowing the wake cross section to be mapped in detail concerning velocity and turbulence intensity. The main purpose of the investigation at KTH was to assess the wake speed deficiency for wind turbine clusters where the important issue is wake speed recovery and turbulence. In performance calculations the so called tip correction factor depends strongly on the helix angle assumed. T.Theodorsen, in this "Theory of Propellers", McGraw-Hill 1948, suggests that all geometry pertinent to be propeller can more conveniently be referred to the "Trefftz' Plane". Applying this idea to a wind turbine means that the apparent tip speed ratio (or helix angle) in the wake be used in place of the nominal tip speed ratio. The conclusion from some numerical exercises suggests that the tip speed ratio taken at the disk, gives better agreement with measurements. The singular tip vortex may be used, rather than some screw surface form which induction emanates. (AB).

It was shown that the aerodynamic damping as predicted by the momentum-blade element theory, depends substantially on the implementation (frozen wake or equilibrium wake). It was also argued that this theory is not easily adaptable to unsteady inflow calculations. Two simple models are proposed for the dynamic inflow of a windturbine, one in integral, one in differential form. Both models are made to have the same steady solution as the momentum-blade element method. Neither model has been tested by the author. They are proposed as food for thought at the IEA Symposium on HAWT aerodynamics. (author).

Stall regulated windturbines in the Netherlands are often equiped with Stork WPS blades, or a similar design, using NACA 4412 to NACA 4424 aerofoils. In a study to improve the characteristics of stall regulated windturbines a search has been made towards sections having a laminar flow over a larger portion of the aerofoil. Laminar flow will diminish the drag coefficient and therefore improve the lift to drag ratio. Little is known of the characteristics of aerofoil having a relative thickness of above 18%. Based upon a classical series of laminar aerofoils, also used already in the windturbine industry, a thick aerofoil has been designed and tested. The results were quite astonishing. They gave the impression that the scant material available on thick aerofoils is seldom measured correctly. Measured values for the maximum lift coefficient using pressure holes in the model were larger than expected. Roughness turned out to be fatal for the aerofoil tested. (AB).

IEA, R and D, WECS.

It is well-known that the direct use of 2D wind tunnel airfoil data as input to an ordinary strip theory performance code does not yield results in satisfactory agreement with experiment. Combined with the standing requirement of operational tools for rotor design, this has led to the development of different synthesizing techniques, during which so-called 3D airfoil data are derived on an experimental/emperical basis. At The Test Station for Windmills, Risoe, such a synthesizing technique has been developed and now used on more rotors. An experimental data base for the NACA 63_n-2nn airfoil, originating from measurements on rotors with diamters 17 m, 19 m, and 22 m, show considerable deviations when compared with 2D data. The trend of the deviations are (1) increased maximum lift CL_{max} close to the hub; (2) reduced slope of the lift curve for the sections close to the tip and (3) reduced CD at high angle of attack. (author).

2373 (NEI-DK–221, pp. 160-167) **Location of flow separation on an 11 m wind turbine blade by means of flow visualization and a two dimensional airfoil code.** Friis Pedersen, T. IEA, R and D, WECS.

The lack of knowledge about the nature and behaviour of the three-dimensional airflow past a stalled wind turbine blade has led to the present study. An 11 m wind turbine blade was fitted with tufts, which were visualized with the use of a video camera, mounted on the root of the blade. Pictures at wind speeds from 12 to 18 m/s were recorded together with recordings of blade bending moments in four different radii. The video pictures show that the tufts clearly respond on the local flow separation. The development

of the stall in radial direction as a function of the wind speed is not clearly detectable, but some general patterns are found. A pronounced parameter dominating the flow separation is the blade azimuth position. During one rotor revolution the separation point can move from positions close to the trailing edge to the leading edge and back again. The visualized flow separation is compared with calculations by a strip theory/blade element code and a two dimensional profile code. For a specific rotor rotation good correlation was found between visualized and calculated separation. In general, though, the observed chordwise movement of the separation points was greater than calculated. (author).

2374 (NEI-DK–221, pp. 168-178) **On the usefulness of surface pressure calculations with a panel method for wind turbines.** Meijer, S. (FFA, Bromma (SE)). Available from NTIS (US Sales Only), PC A12.

IEA, R and D, WECS.

In a recent paper on three-dimensional calculations of wind turbine surface pressures it was stated that the discrepancies between measured blade forces and forces calculated with so called Blade-Element Theory (BET) are due to inviscid effects. The use of BET gave too small blade forces even at low angles of attack while the use of a panel method gave blade forces that were in better agreement with experiments. The wake geometry in the panel method was prescribed. In order to demonstrate the effects of different assumptions about the wake geometry I have carried out calculations with a panel program for a wind turbine with two blades at three different tip speed ratios (TSR), 4, 8 and 16. The blade profiles are from the NACA44 series. The results are compared with results from the program WINRO, which is based on BET and uses Prandtl's correction for the tip loss. Calculated invicid two-dimensional profile data were used in WINRO. (AB).

IEA, R and D, WECS.

At present wind turbines use conventional aircraft aerofoils. The most common are old NACA sections 44xx, 230xx and 64_3 series. More recently the general aviation aerofoils, now known as LS-1 and LS-1 Mod, have received a great deal of attention and are increasingly used on new blades. The flow encountered by a wind turbine is sufficiently different to that encountered by a fixed wing aircraft to merit consideration of the design of aerofoils specifically for wind energy use. The work reported here is taken from a project undertaken on a UK Department of Energy project, E/5A/CON/5107/1843, aimed at performing that task for horizontal axis, pitch regulated machines. The only data published on this topic is the work undertaken by Tangler and Somers in the USA. Their remit was different from ours in that their work was aimed directly at small, stall regulated machines. (author).

Available from NTIS (US Sales Only), PC A12.

IEA, R and D, WECS.

The main subject of the paper, is an extension of the plane actuator-disc concept to comprise an actuator surface of arbitrary shape as proposed by MADSEN (1985). The starting point of the derivation will be based on the physical conditions in a real rotor, thus revealing the relationship that was missing in the original definition of the actuator disc. On the basis of the general actuator surface it is shown that the Betz limit is not unique for different types of wind turbines. A numerical example for a straight-bladed vertical-zxis wind turbine shows that the Betz limit can probably be exceeded. The governing system of equations for the three-dimensional flow through an actuator surface is described and a possible method of solution is sketched. Results from the solution of the two-dimensional flow problem are then shown for two different actuator surfaces, the original plane actuator disc and an actuator cylinger. For the former, only the linear solution is outlined together with the classical and commonly used momentum theory solutions. We address the limitations of the momentum theory and their consequences as we deal here with a calculation method widely used in industry and research. The results from applications of actuator surface theory on wind turbine rotors illustrated by a number of graphs. (AB).

The periodically changing flow field in the rotor plane and in the wake of the rotor were measured on the GROWIAN wind turbine model (scale 1:25) as well as the circulation distribution of the blades. To this end an ultrasonic traveltime measuring device was developed with a maximum sample rate of 1250 per second. The measured flow fields are shown as 3-D-pictures allowing detailled insight into the time/space behaviour of the flow. The direct measurement of circulation is used to evaluate the lift distribution of the rotating blade. These results show good agreement with theoretically calculated lift distributions. Prepared for ELKRAFT.

The nature and causes of noise pollution from larger windmills are discussed in special relation to generators, gears, and hydraulic and ventilation systems. Following this the construction of the tower and the machine housing are described and a specific example of a Danish-produced wind turbine is presented in detail. (AB) 12 refs.

2381 (PNL-SA–17250) **Detailed analysis of the wake and free-flow characteristics at the Goodnoe Hills MOD-2 site.** Elliott, D.L.; Barnard, J.C. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. (CONF-890981–4: Windpower '89, San Francisco, CA (USA), 24-27 Sep 1989). Order Number DE90002725. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Wind data collected on meteorological towers at the Goodnoe Hills MOD-2 wind turbine site were analyzed to characterize the free wind turbine wakes over the site. Free-flow characteristics examined were the variability of wind speed and turbulence intensity across the site as a function of wind direction. Scattered areas of trees upwind of the site caused pronounced variations in the wind flow over the site. A substantial increase in the turbulence, as well as a considerable decrease in the mean wind speed, was observed when a tower was downwind of the trees. Wind turbine wake characteristics analyzed included the average velocity deficits, wake turbulence, and the vertical profile of the wake. Wake behavior downwind of the turbines was analyzed at distances from 2 to 10 rotor diameters (D). The relationship between velocity deficit and downwind distance was surprisingly linear. Largest deficits were at low wind speeds and low turbulence intensities. Wake turbulence was greatest along the flanks of the wake, and the vertical variation of deficits was greater below hub height than above. 1 ref., 6 figs.

2382 (RISO-M–2795) **Generation of fatigue loads on Windane 40/2.** Voelund, P.; Rasmussen, F. Risoe National Lab., Roskilde (Denmark). Jun 1988. 49p. (In Danish). Order Number DE90718936. Available from NTIS (US Sales Only), PC A03/MF A01.

The report contains a new calculation method for generation of dynamic load spectra for wind turbines. The deterministic and stochastic loads are calculated separately and added in the time domain. The load spectra are found by rainflow-counting on the generated time series. Based on the load spectra calculation of fatigue life are carried through according to the Palmgreen-Miner's rule of damage accumulation. In the report the method is exemplified by calculation of the dimensioning fatigue loads in flapwise direction in the blade root of a pitch-regulated Windane 40/2 for the Masnedoe Windfarm. Equivalent analysis of a limited amount of data measured on the Masnedoe wind turbines are carried through. The measurements confirms the calculated results. (author) 33 ills., 4 refs.

2383 (SERI/STR–257-3479) **Computer simulation of wind/diesel system operation.** Solar Energy Research Inst., Golden, CO (USA); AeroVironment, Inc., Monrovia, CA (USA); Integral Technologies, Inc., Westmont, IL (USA). Sep 1989. 100p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE89009445. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This document reports on a computer code, SOLSTOR W/D, that determines — for a site's wind energy resources, load requirements, and economic constraints — the components and sizes for a wind/diesel system that result in the lowest cost of energy. Wind diesel systems are defined here as electricity generation stations in the 50-kW to 1-MW range that (1) are not connected to another electricity network, (2) use wind energy as the first source of supply to meet demand, and (3) contain sufficient energy storage and/or backup diesel electric generators to compensate for lapses in wind energy. The computer code also determines, for the same input load, the requirements and economics that are the best number and size for an isolated diesel(s) system so that comparisons for wind/diesel systems and diesel-only systems can be made. SOLSTOR W/D provides a systematic method to show whether wind-diesel systems can be an attractive means of saving fossil fuel without significantly affecting electricity quality or production cost. 12 refs., 66 figs., 5 tabs.

2384 (SERI/TP–257-3591) **An initial look at the dynamics of the microscale flow field within a large wind farm in response to variations in the natural inflow.** Kelley, N.D. Solar Energy Research Inst., Golden, CO (USA). Oct 1989. 5p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-890981–3: Windpower '89, San Francisco, CA (USA), 24-27 Sep 1989). Order Number DE89009501. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper discusses some early results from a study to examine the influence of the natural inflow structure on the internal microscale turbulence environment of a large wind farm. Two fully equipped, high-resolution boundary layer measurement systems were employed to document the alteration of the turbulent structure as the flow entered and left a wind park consisting of 41 rows of turbines. These systems collected data continuously for a period of several weeks during the peak wind season in San Gorgonio Pass. In addition, statistical summaries of the inflow and outflow characteristics from a hub-height elevation were recorded prior to, during and after the detailed measurement period. Results of these hub-height summaries will be discussed and interpreted in this paper. 11 figs.

2385 (SL–1251-85195-20) **Power mesurements on a 99 kW "Smedemoelle" wind turbine, erected at Hasle, Bornholm.** Jensen, S.A.; Kristensen, J.W. Skibsteknisk Laboratorium, Lyngby (Denmark). Apr 1986. 45p. (In Danish). Order Number DE90719284. Available from NTIS (US Sales Only), PC A03/MF A01.

This project contains results from field measurements carried out on a 99 kW "Smedemoelle" wind turbine. The hub height is 24 m. The 99 kW "Smedemoelle" is a horizontal axis turbine with a 3-bladed, upwind rotor. The diameter of the rotor is 21 m. The test programme has given information about the electrical power output from the wind turbine as a function of the wind speed at the hub height, the total efficiency of the wind turbine as a function of the wind speed at hub height and the annual energy production of the wind turbine under different wind conditions. The power curve and the total efficiency curve are shown in the form of graphs. Some further measurements were carried out with the purpose of investigating the power curve for different cut-in and cut-out wind speeds for the generators. These further measurements have given information about the electrical power output from the wind turbine as a function of the wind speed at hub height with only the large generator in operation and the electrical power output from the wind turbine as a function of the wind speed at hub height with only the small generator in operation. The power curve with the large generator in operation and the efficiency curve with only the large generator in operation are illustrated by graphs. (AB).

2386 (STEV-VIND–89-17) **Evaluation of the relation (coherence) between wind speed and various set parameters at the Naesudden wind power plant.** Thor, S.E.; Ahlin, K. Statens Energiverk, Stockholm (Sweden); Flygtekniska Foersoeksanstalten, Stockholm (Sweden). 15 Nov 1988. 22p. (In Swedish). (FFAP-A–778). Order Number DE90719438. Available from NTIS (US Sales Only), PC A03/MF A01.

Three long-range campaigns at the Naesudden wind power plant were evaluated in order to study in what frequency region there is good agreement (coherence) between wind velocity and power. The coherence exceeds 0.50 at frequencies lower than ca. 0.03Hz (33

seconds). Similar results are obtained for the other signals. By frequencies above ca. 0.1Hz the load upon the plant is on the whole dependent on the dynamic properties of the structure. Loads from wind shear will however produce higher frequencies than 1 Hz.

2387 Proceedings of the eighth ASME wind energy symposium. SED-Vol. 7. Berg, D.E. Klimas, P.C. 302p. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

This book is composed of the proceedings of the Eighth ASME Wind Energy Symposium. Topics covered include: Wind inputs, wakes and array effects; Aerodynamics; Structural dynamics, Power systems I and II; Systems and system dynamics; and Testing of wind systems and components.

2388 Advances in three-dimensional turbulence measurement capability. Connell, J.R. (Pacific Northwest Lab., Richland, WA (USA)); Morris, V.R. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Requirements for three-dimensional turbulence velocity measurements for wind turbine purposes have recently led to advances in anemometer accuracy and resolution, particularly for situation when the angle of the wind relative to the anemometer axis is large. New precision calibration data for a complete three-dimensional UVW propeller anemometer are presented. Repeatability of calibration data and comparison with previous calibrations are shown. Special attention is given to the calibration of the crosswind components, V and W.

2389 Estimation of turbulence variance and scale, simplified for wind turbine applications. Powell, D.C. (Pacific Northwest Lab., Richland, WA (USA)). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

A simplified method is presented for estimating onsite turbulence variance within the wind turbine layer for horizontal wind speed. The method is based principally on estimating the probability distribution of wind speed and assigning a variance to each mean wind speed based on surface roughness estimates. A revision of the Kaimal neutral u-component spectrum is suggested to apply to the mix of the stabilities occurring during operational winds. Values of integral length scale calculated from data analysis are shown to contradict the length scale model implicit in turbulence power spectra. Also, these calculated values are shown to be extremely sensitive to the length of the time series and the detrending method used.

2390 Effect of turbulence scale on VAWT aerodynamic response. Homicz, G.F. (Sandia National Labs., Albuquerque, NM (USA). Aerodynamics Dept.). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The size of the DOE/Sandia 34 m VAWT Test Bed recently erected in Bushland, Texax necessitates that variations in turbulence in the crossflow planes, i.e., across the face of the rotor, be included in any simulation. Accordingly, the earlier model had been modified to incorporate a full 3-D turbulence simulation. The incorporation of flow retardion effects, i.e., the fact that the reduction in mean flow velocity across the rotor reduces the rate at which the turbulence is convected through it, will also be discussed. The aerodynamic response model is the same as that used earlier, and includes the effects of Reynolds' number variation, discontinuous changes in airfoil section/chord, and the numerical results are presented to illustrate the effects of varying the ratio of turbulence scale (both streamwise and transverse) to rotor size. Preliminary comparisons between the model's predictions and data from the 34 m Test Bed are discussed. Finally, a simple formula is postulated for predicting the influence of turbulence on average output power, which does not require use of a full stochastic simulation.

2391 Finite difference analysis of the three dimensional flow field of a vertical axis wind turbine. Rajagopalan, R.G. (Iowa State Univ. of Science and Technology, Ames, IA (USA). Dept. of Aerospace Engineering); Klimas, P.C. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The performance of a three dimensional vertical axis wind turbine in laminar flow field is analyzed using an elliptic finite difference procedure known by the name SIMPLER. The conservation equations of mass and momentum are solved using a primitive variable approach wherein the primitive variable p (static pressure), u (component of velocity in the i-direction), and w (component of velocity in the k-direction) are solved for directly. The motion of the blades are time averaged and introduced through the source terms of the momentum equations. Performance characteristics such as power coefficient and normal and tangential force coefficients are computed and compared with experimental results and other theoretical methods.

2392 Prediction of stochastic blade responses using measured wind speed data as input to the FLAP code. Wright, A.D. (Solar Energy Research Inst., Golden, CO (USA)); Thresher, R.W. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The objective of this paper is to show FLAP code predictions compared to measured blade loads, using actual anemometer array data and a curve-fitting routine to form series expansion coefficients as the turbulence input to FLAP. Three 10-min data cases are used to compare FLAP predictions to measured results. Each case represents a different mean wind speed and turbulence intensity. The time series of coefficients in the expansion of the turbulent velocity field are input to the SLAP code. Time series of predicted flapbending moments at two blade radial stations are obtained, and power spectra of the predictions are compared to power spectra of the measured blade bending moments. Conclusions are drawn about the FLAP code's ability to predict the blade loads for these data cases. Recommendations for future work are made.

2393 Prediction of stochastic blade responses using a filtered noise turbulence model in the FLAP code. Thresher, R. (Solar Energy Research Inst., Golden, CO (USA)); Wright, A.D.; Holley, W.E. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The time-domain model described in this paper uses a random number generator to construct a whit-noise time series with uniform spectral density over the frequency range of interest. This signal is then filtered to obtain the various wind fluctuations, which are used as input to the FLAP code. This requires as input only the mean wind speed, the turbulence intensity, and an estimate for the integral scale. The modeling is based on the assumptions that the velocity fluctuations are statistically stationary, homogeneous, and isotropic, and satisfy Taylor's frozen field hypothesis. The von Karman model is used to characterize the correlation between velocities of points separated in space. To gain insight into the usefulness of this turbulence simulation for predicting stochastic turbine loads, the Flap code was used to model three data cases from the 1986 testing done on the Howden 330-kw turbine.

2394 VAWT dynamic stall models revisited. Berg, D.E. (Sandia National Labs., Albuquerque, NM (USA)). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Many VAWT aerodynamic loads codes incorporate the Gormont (or Boeing-Vertol) dynamic stall model. The model is relatively simple and easy to implement, and (in conjunction with the Masse' correction), it produces results which quite accurately predict the overall performance of a variety of VAWTs. The Gormont model, however, was developed for helicopter applications and was based on data from thin airfoils that underwent relatively small oscillations in angle of attach about the static-stall angle of attack. In the VAWT application, it is used to model the behavior of thick airfoils (15-21%) undergoing large oscillations (+/- 30-40^0) about zero angle of attack. All of us who have used this model have had some reservations about using it in this context. However, its use produced good agreement with measured data and little or no dynamic data have been available for appropriate airfoil sections with time histories approximating those experienced by VAWT blades. Ohio State University has developed a database of static and dynamic lift data for the NACA 0021 (with and without vortex generators) and SAND 0018/50 airfoils, both of which are used on VAWTs. They are in the process of analyzing this data and attempting to develop a semi-empirical dynamic stall correlation that will yield a relatively accurate representation of that data without requiring excessive amounts of computer time or storage. This presentation presents comparisons of the Gormont model predictions and measured data and discusses the progress that has been made in achieving an improved dynamic-stall correlation for VAWT application.

2395 **Three-dimensional wind simulation.** Veers, P.S. (Sandia National Labs., Albuquerque, NM (USA)). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

A method for numerically simulating a three-dimensional field of turbulent wind-speed (the "Sandia method") for use in the aerodynamic and structural analyses of wind turbines is presented. The required inputs are single point power spectral densities (PSDs) and the coherence function. Suggestions for appropriate inputs and an example calculation are included. The simulation method is used to obtain "rotationally sampled" PSDs, which are compared with measurements obtained by Pacific Northwest Laboratories. The results show that the Sandia method is capable of producing simulations that agree with the measurements, especially when the coherence function is augmented from the usual form to include the ratio of spatial separation over height, raised to the 0,25 power. The method is specialized for horizontal axis wind turbine analysis.

2396 **Fatigue characterization of a VAWT blade material.** VanDenAvyle, J.A. (Sandia National Labs., Mechanical Metallurgy Div., Albuquerque, NM (US)); Sutherland, H.J. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The fatigue analysis of Wind Energy Conversion System blades has been limited by the lack of fatigue data for typical blade materials, including 6063 aluminum, an alloy commonly used for Vertical Axis Wind Turbine (VAWT) blades. This paper reports results to date of a testing program to establish a fatigue properties database for this alloy. Two types of fatigue response data were measured: stress versus number of cycles to failure (S-n) and fatigue crack growth rates. S-n experiments have been conducted on 6063 aluminum blade extrusion material using approximately 100 bend specimens cycled at five alternating stress amplitudes and at four mean stress levels. Data have been analyzed using an equivalent alternating stress based on Goodman's rule to describe mean stress effects on fatigue life. Cyclic crack growth rates have been measured using three loading ratios.

2397 **Simplified fatigue damage and crack growth calculations for wind turbines.** Veers, P.S. (Sandia National Labs., Wind Energy Research Div., Albuquerque, NM (US)). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Estimating fatigue life of wind turbine components, where the loading and structural response are random, can be a difficult task. The life estimate is sensitive to rare large loads and can be influenced by the sequence of load applications. Sequence effects in fatigue crack initiation and crack growth are outlined. A simplified model for sequence effects in crack growth is presented along with model predictions of an American Society for Testing and Materials (ASTM) crack growth test series. The relative importance of including these effects in fatigue calculations is discussed. Analytical solutions for the time to crack initiation and crack growth provide quick estimates of fatigue life by approximating the loading as a narrow-band Gaussian process and by neglecting sequence effects. This approximation is both conservative and within the usual scatter in fatigue life estimates due to material variability. It is therefore a useful tool in estimating fatigue life, especially when turbine response data is limited.

2398 **Crack propagation analysis of WECS components using the LIFE2 computer code.** Sutherland, H.J. (Sandia National Labs., Wind Energy Research Div., Albuquerque, NM (US)); Schluter, L.L. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The LIFE2 code is a fatigue/fracture analysis code that is specialized to the analysis of wind energy conversion system components. The code was originally developed by Sutherland, Ashwill and Naassan. It is a PC-compatible Fortran code that is written in a top-down, modular format. This paper discusses the additions to the code that permit WECS components to be analysed using linear fracture mechanics. To illustrate the capabilities of the numerical techniques employed here, two example problems are presented.

2399 **Development of the University of Massachusetts wind/diesel simulator.** Stein, W. (Massachusetts Univ., Amherst, MA (USA). Dept. of Mechanical Engineering); Manwell, J.; McGowan, J.; Rogers, T.; Jones, M.; Jeffries, W. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

A description of the wind/diesel simulator recently developed at the University of Massachusetts is presented in this paper. This system consists of a wind turbine simulator, a phase controlled rectifier DC drive, a simulated load, a frequency controlled dump load, a 15 KW synchronous generator driven by a 40 hp diesel engine, and associated controls and instrumentation. Details of the wind turbine simulator control dynamics are given including the governing analytical relationships for the systems control schemes. The analytical results include a discussion of the system validation including power curve testing plus a determination of the dynamic response of the system. The dynamic response validation included a step test as well as the calculation of the power spectral density for an input wind speed series and the wind turbine generator. In addition, a summary of the experimental results for an initial simulation run of the wind/diesel simulator system is given.

2400 **A case study of a no storage wind/diesel system: Block Island.** . Manwell, J.F. (Massachusetts Univ., Amherst, MA (USA). Dept. of Mechanical Engineering); McGowan, J.G.; Jeffries, W.; Kirchhoff, R. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Recent worldwide interest in wind/diesel hybrid systems has generated a need for reliable data sets from full-sized operational systems. One of the configurations of practical interest, especially for larger sized applications, is the no storage type system. This paper presents a summary of the work from a recent research program carried out using previously unpublished work from the NASA/DOE MOD-OA wind turbine installation with the diesel powered grid

of the Block Island Power Company. In addition to a general overview of the Block Island project and the operations of the Block Island Power Company, this paper reviews the experimental results published in previous technical reports/papers on the subject. In addition to technical conclusions from this analysis, the paper also contains recommendations for future analysis work using this unique set of wind/diesel system data.

2401 Time domain structural response calculations for vertical axis wind turbines. Dohrmann, C.R. (Sandia National Labs., Albuquerque, NM (USA). Applied Mechanics Div. III); Veers, P.S. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Structural response of Vertical Axis Wind Turbines (VAWTs) during transient events such as starting and stopping or during variable speed operation cannot be estimated with existing frequency domain techniques. Time domain simulation is presented, including the effects of changes in rotation speed on turbine response. The method for predicting the structural response of VAWTs during variable speed events differs from that used to analyze constant speed operation in two ways: the equations of motion no longer have constant coefficients and additional terms contribute to the stiffness matrix and loading vector. The structural matrices are obtained at several discrete rotor speeds using NASTRAN and interpolated for intermediate speeds. The equations of motion are then numerically integrated in a separate program. Results for constant speed operation in turbulence-free winds agree favorably with those from a frequency domain analysis.

2402 Aerodynamic pressure and flow-visualization measurement from a rotating wind turbine blade. Butterfield, C.P. (Solar Energy Research Inst., Golden, CO (USA)). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Aerodynamic, load, flow-visualization, and inflow measurements have been made on a 10-m, three-bladed, downwind, horizontal-axis wind turbine (HAWT). One objective of this comprehensive research program was to study the effects of blade rotation on aerodynamic behavior below, near, and beyond stall. To this end, flow patterns are presented here that reveal the dynamic and steady behavior of flow conditions on the blade. Pressure distributions are compared to flow patterns and two-dimensional wind tunnel data. Separation boundary locations are shown that change as a function of spanwise location, pitch angle, and wind speed.

2403 Liquid-crystal, shear-stress-visualization experiments on a horizontal axis wind turbine. Reda, D.C. (Sandia National Labs., Albuquerque, NM (USA)); Butterfield, C.P. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

A diagnostic technique capable of visualizing the instantaneous surface shear stress pattern in dynamic flow fields, in a continuous and reversible manner, would prove to be a valuable research tool. The potential of liquid crystals to meet this objective has been under investigation at Sandia National Laboratories. A description of the technique and results obtained to date are given. This paper discusses a cooperative research effort was jointly conducted by Sandia National Laboratories and the Solar Energy Research Institute to investigate the feasibility of applying the liquid crystal technique to horizontal axis wind turbines operating in field environments. These liquid-crystal tests were conducted on a three-bladed, downwind, variable-pitch, zero-yaw machine which incorporated the SERI-S809 constant-chord/zero-twist airfoil. In this paper, the technical feasibility and viability of the liquid-crystal technique in WECS field environments is further demonstrated.

2404 A comparison of results from dynamic-response field tests. Hock, S.M. (Solar Energy Research Inst., Golden, CO (USA)); Thresher, R.W.; Wright, A.D. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC02-83CH10093. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The dynamic response of Howden's 330-kW horizontal-axis wind turbine (HAWT) and the Northern Power Systems 100-kW North Wind 100 HAWT has been measured. This paper presents the results from each of these test programs in an effort to compare the dynamic response of each turbine. The analysis focuses on rotor bending loads in terms of both time domain and frequency response. The FLAP code is used to explore sensitivity to teeter stiffness and natural frequency placement to provide a better understanding of the differences in behavior caused by configuration alone. The results are presented in the form of normalized azimuth-average plots of the deterministic loads, and spectral density plots of the stochastic responses. This presentation of the results contrast major response differences due to design configurations.

2405 Preliminary results from the fatigue testing of northern power systems 100KW wind turbine. Osgood, R.M. (Solar Energy Research Institute, Wind Energy Research Center, Golden, CO (US)). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Preliminary results from the 1988 wind season fatigue test of Northern Power systems' 100KW wind turbine are summarized in this report. The wind turbine is a two-bladed upwind teetering hub configuration with passive blade pitch control. Data presented for both teetering hub and locked-out teeter (rigid rotor) furnishes a comparison of cyclic loads developed for both hub configurations. Preliminary results are given. These results provide a preliminary view of steady operating loads and cyclic loads required for fatigue damage predictions and a comparison of rigid rotor and teetering rotor dynamic response to random inflow conditions.

2406 Initial structural response measurements for the Sandia 34-meter VAWT test bed. Ashwill, T.D. (Sandia National Labs., Wind Energy Research Div., Albuquerque, NM (US)). vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Sandia National Laboratories has designed and constructed a 34-meter diameter vertical axis wind turbine (VAWT) Test Bed. The machine will be used to advance research in aerodynamics and structural dynamics, improve fatigue life prediction capabilities, and investigate control algorithms and system concepts. The Test Bed has extensive instrumentation including 70 strain gauges to measure blade and tower response. Immediately after the blades were mounted, blade gravity stresses were measured and a modal analysis on the stationary rotor was performed to determine zero rpm modal frequencies. Assembly and start-up tests have been completed, and testing is in the machine characterization phase. Resonance surveys are underway to fully characterize the modal frequencies and mode shapes of the rotor, drive train and support cables. Measured gravity stresses, centrifugal stresses, and modal frequencies are compared to predicted values.

2407 Aerodynamic performance of the Sandia National Laboratories 34-meter-diameter vertical axis wind turbine test bed. Klimas, P.C. (Sandia National Labs., Albuquerque, NM (USA)); Stephenson, W.A. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

Sandia National Laboratories (SNL) is currently operating its Department of Energy (DOE) -funded 34-M-diameter Vertical Axis

Wind Turbine (VAWT) Test Bed on a Department of Agriculture (USDA) site near Amarillo, Texas. This versatile VAWT, rated at 500 kW in a 12.4 m/s (28 mph) wind, has been designed to demonstrate aerodynamic, structural dynamic, and control strategies intended to improve the effectiveness of VAWT systems.

2408 **Model validation of the Sandia 34-meter test bed turbine using substructured modal-testing.** Carne, T.G. (Sandia National Labs., Albuquerque, NM (USA)); Lauffer, J.P.; Gomez, A.J.; Ashwill, T.D. vp of Proceedings of the eighth ASME wind energy symposium. Berg, D.E. Klimas, P.C. American Society of Mechanical Engineers, New York, NY (1989). DOE Contract AC04-76DP00789. (CONF-890102–: 12. ASME annual energy-sources technology conference and exhibition, Houston, TX (USA), 22-25 Jan 1989).

The Sandia 34-Meter Test Bed Turbinre is a vertical-axis wind turbine, thirty-four meters in diameter, designed to provide a test-bed for research in aerodynamics, structures and control. In order to design a large wind turbine, knowledge of the modal frequencies and mode shapes is essential for predicting structural response. During the design, analytical or finite element models are utilized for estimates of these modal parameters. However, when hardware becomes available, modal testing can be used to verify or update the models. The concept of substructure modal testing was developed for the Sandia 34-Meter Test Bed in order to more fully evaluate the accuracy of the finite element model. Instead of performing only one test on the entire turbine, separate tests and analyses were performed on major substructures of the turbine, including three separate blade sections, the tower supported by the guy cables, and the entire turbine. The results are compared to analytical predictions from the finite element models of the substructures and the entire turbine.

2409 (CONF-891113–6) **Comparison of advanced power generation technologies using computer simulations.** Rodgers, B.R.; Maude, C.M. Oak Ridge National Lab., TN (USA). [1989]. 17p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC05-84OR21400. From American Institute of Chemical Engineers annual meeting; San Francisco, CA (USA); 5-10 Nov 1989. Order Number DE90002494. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The intent of this report was to evaluate 'advanced technologies' for power generation by comparing examples from each generic type on a common basis. Due to the diversified nature of these technologies, computer process simulations were found to be the only suitable means for obtaining a common basis. A large number of process options significantly effected the performance of the advanced technologies. Independent measurements were made to determine the efficacy of the most important ones, namely, plant size, hot gas cleaning, supercritical steam cycle, air blown versus oxygen blown gasifiers, high sulphur coal, integrated oxygen plant, and advanced high temperature gas turbines. The results are summarized. 3 refs., 2 figs., 3 tabs.

2410 (EPRI-CS–5588-Vol.3) **Remaining-life estimation of boiler pressure parts: Volume 3, Base metal model: Final report.** Roberts, B.W.; Askins, M.C. Electric Power Research Inst., Palo Alto, CA (USA); Combustion Engineering, Inc., Chattanooga, TN (USA); Central Electricity Research Labs., Leatherhead (UK). c Nov 1989. 137p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

One of the objectives of EPRI contact 2253-1, "Estimating the Remanent Life of Boiler Pressure Parts", was the development of a metallographic approach relating microstructural degradation of parent material to remaining life. This Report describes the work undertaken in completion of this objective. A cast of 1Cr1/2Mo steel has been creep tested in argon at stresses in the range 34–80 MPa and temperatures between 590–630°C in various heat treatment states, including normalized and tempered, and overaged. Various metallurgical techniques have been used and parameters measured on the ex-creep tested specimens, for assessment of their use in remanent life evaluations. These include hardness, bulk extraction of carbides and x-ray examination of the phases present, determination of matrix solute content, x-ray determination of the matrix lattice parameter and carbide extraction replication of the structure and measurement of various interparticle spacing parameters. In application to plant the interparticle spacing can be determined from a small sample removed from the component. Either cast-to-cast bounds on the constants required by the model can be used or determinations of the cast specific constants made on the sample. Of the other metallurgical parameters examined it is concluded that the current technique of bulk extraction does not allow useful determination of matrix composition nor carbide phases present. 60 refs., 80 figs., 18 tabs.

2411 (EPRI-EL–6483) **Knowledge-based system: Voltage and VAR [volt-ampere-reactive] dispatch: Final report.** Tweed, E.D. Electric Power Research Inst., Palo Alto, CA (USA); Union Electric Co., St. Louis, MO (USA). c Oct 1989. 85p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The objective of this research project is to develop a demonstration volt/VAR dispatch knowledge-based system that develops strategies to achieve a predetermined voltage profile and to relieve overloaded devices. This knowledge-based system utilizes a realistic model of an electrical utility and its interconnections. It produces results that can be compared and evaluated with respect to the procedures that would be followed in a control center if a similar problem occurred. A realistic simulation was created to model an electric utility system in normal and abnormal states. The knowledge-based system examines the difference between the normal and abnormal states of the electrical network, identifies the problems that have occurred and develops a diagnosis of the probable cause. 4 refs., 1 fig., 25 tabs.

2412 (EPRI-GS–5949) **Guidelines for the prevention of economizer inlet header cracking in fossil boilers: Final report.** Stephenson, G.G. Electric Power Research Inst., Palo Alto, CA (USA); Ontario Hydro, Toronto, ON (Canada). c Nov 1989. 188p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

A large number of utilities are experiencing cracking of the inlet headers of economizers in fossil boilers. The first evidence of its occurrence is generally a pinhole leak in the header/stub tube attachment weld. Inspection of the tube bore hole in the header will reveal numerous longitudinally oriented cracks which may propagate across the ID ligament spacing between bore holes. The mechanism is associated with the introduction of relatively cold feedwater to the hot header during start-up and off-line drum top-up periods producing thermal fatigue damage. State-of-the-art techniques for the prevention and control of economizer inlet headers have been identified from utilities' and boiler manufacturers' experience. This data has been used to produce a comprehensive and practical guideline for utility use. The guideline has been set-up to lead the user through a step-by-step process, indicating what information needs to be obtained at each step, how it should be analyzed, and the conclusions to draw. Inspection techniques to determine the extent of the damage and temperature monitoring tests to correlate the damage with operating parameters are important first steps in the analysis. Operating procedure modifications to reduce thermal stresses are discussed which will alleviate the problem. 20 refs., 53 figs.

2413 (EPRI-GS–6253) **The TVA moving-manifold targeted-chlorination system: Second field demonstration: Final report.** Moss, R.D.; Gautney, S.P.; Johnson, J.T.; Bain, J.W. Jr.; Scrudder, R.O.; Vigon, B.W.; Reichenbach, N.G. Electric Power Research Inst., Palo Alto, CA (USA); Battelle Columbus Div., OH (USA). c Nov 1989. 147p. Sponsored by Electric Power Research Institute.

Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The Tennessee Valley Authority has pioneered the use of a novel technique, called "Targeted Chlorination," to control biological fouling in utility condensers. In 1983 and 1984, TVA made the first field evaluation of a targeted chlorination system at the Kingston Fossil Plant. This report describes the design, operations, and results of a second field demonstration conducted during 1985 at the John Sevier Fossil Plant. System design, operation, and data collection were performed by TVA; data analysis and interpretation were provided by Battelle-Columbus Division. Specific evaluations address the effect of targeted chlorination on the unit's thermal performance, the unit heat rate, the unit's chlorine usage, the system's operational dependability, and the impact on plant manpower requirements. An evaluation comparing the costs of a targeted chlorination system to a dechlorination system is also included. 24 refs., 49 figs., 30 tabs.

2414 (EPRI-GS–6544) **Gas turbine blade life assessment and repair guide: Final report.** Swaminathan, V.P.; Lowden, P. Electric Power Research Inst., Palo Alto, CA (USA); Southwest Research Inst., San Antonio, TX (USA); Liburdi Engineering Ltd., Hamilton, ON (Canada). Nov 1989. 188p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Combustion turbine hot section rotating blades are fabricated from nickel-base superalloys and operate at high temperatures. Both metallurgical and mechanical property degradation of the blading material occurs during service which can limit the useful service life of blades. It is important to assess the condition of blades periodically and remaining life estimated to provide guidelines for replacement or reconditioning of the blades. Sections 1 through 7 of this report present the necessary background for the user of this guidebook to understand the various aspects of the superalloys. Sections 8 and 9 provide step-by-step guidelines for remaining life assessment, repair and refurbishment of blades. Initially, this report provides a background on the metallurgy of the superalloys and how service aging changes the microstructural features and adversely affect the mechanical properties. A thorough review of methodologies available in the literature to estimate the life of blades under foreign object damage, creep and thermal-mechanical fatigue conditions is presented in the next section. How engine operating conditions affect blade life and the various destructive and non- destructive testing methods to evaluate the condition of blades are discussed next. Various repair and refurbishment procedures available to restore service damaged blades are then presented. Finally, general guidelines are presented for blade life assessment and for repair and refurbishment of service-run blades. 94 refs., 87 figs., 6 tabs.

2415 (EPRI-GS–6574) **Model validation: Cooling-tower performance: Final report.** Miller, P.B.; Starnes, G.L. Electric Power Research Inst., Palo Alto, CA (USA); Pacific Gas and Electric Co., San Ramon, CA (USA). Technical and Ecological Services. c Nov 1989. 45p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The purpose of the fill performance validation project is to examine the accuracy of the cooling tower computer models and fill performance data that have recently been made available through EPRI. This project compares actual full scale tower performance test results to those predicted by the tower models. The cooling tower models used in this project include: FACTS/FACTR, developed by the Tennessee Valley Authority (TVA); VERA2D-86/VERAT, developed by CHAM of North America; and TEFERI, developed by Electricite de France. All full scale cooling tower performance test data used to validate the models were collected at PG&E's Full Scale Crossflow Testing Facility. Three different fills have been tested in this facility during this project. Test results for one of the fill types (Type 'T') are directly compared to predictions based on results from the EPRI Small Scale Test Facility. The other full scale test results are used to validate the hybrid fill modeling capabilities of the FACTS computer code. 9 refs., 6 figs., 7 tabs.

2416 (N–89-27702) **Development and refinement of test bed simulations.** Dravid, N.V.; Miller, D.R.; Patterson, A.G.; Gombos, F.J. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Aug 1989. 8p. (NASA-TM–102335;E–5043;NAS–1.15:102335;CONF-8908177–: 24. intersociety energy conversion engineering conference, Washington, DC (USA), 6-11 Aug 1989). Available from NTIS, PC A02/MF A01.

Lewis Research Center of NASA, with support from Rocketdyne, was engaged in non-real time computer simulation effort for the Space Station Freedom Electric Power System (EPS) EASY5, a simulation package, is used as the primary tool for this activity. Early in the design of the EPS, two test beds were set up at Lewis. The Integrated Test Bed (ITB), that combines and upgrades these test beds, is in the planning stage. The test beds are designed to functionally represent many of the components of the EPS and their interconnections. The simulation effort is primarily directed towards these test beds. Model verification is performed using test bed data.

2417 (PB–89-229421/XAB) **Advanced gas-turbine steam-injection program water treatment for steam-injected gas-turbine systems. Topical report, October 1987-March 1989.** Ayala, R.E.; Thames, J.M. General Electric Co., Cincinnati, OH (USA). Aircraft Engines. Mar 1989. 314p. Available from NTIS, PC A14/MF A01.

Portions of this document are not fully legible.

Water availability, treatment costs, and resultant water quality to ensure technical reliability and economic feasibility of a power plant were determined to define options for reliable, yet cost-effective, water-treatment processes for advanced cogeneration cycles. A review of corrosion and deposition principles for both combustion and steam systems was conducted to identify the most detrimental contaminants causing corrosion and deposition in gas-turbine systems. Specifications for the maximum levels of these contaminants were established for turbine combustion gases and steam boiler (i.e., blowdown) water, and treatment process product water. A Base Case water treatment process recommended for the water treatment system by the water treatment companies contacted includes multimedia and carbon filtration, reverse osmosis, and demineralization.

2418 (PB–89-231609/XAB) **Analysis of the national and regional potential for gas use in electric-utility emissions control. Topical report, December 1988.** Hollander, S.; Makovich, L. DRI/McGraw-Hill Energy Service, Lexington, MA (USA). Dec 1988. 195p. Available from NTIS, PC A09/MF A01.

This study first examined the total maximum potential for gas use in coal-fired electric power plants. In the next phase of the study, the economics of using natural gas reburn with sorbent injection was compared with flue-gas desulfurization systems and switching to low-sulfur coal in each coal-fired plant to determine which might be the lowest cost option for reducing SO_2 emissions. The study finds that the potential US natural gas demand from the environmental control market in competition with other SO_2 control technologies ranges from 200 to 750 billion cubic feet, depending on the cost of natural gas to the plant and the amount (in dollars per tonnage emission reduction) the plant is willing to pay for emissions control. The study is an attempt to analyze the potential amount of gas that may be used to meet emissions control requirements placed on coal-fired electric generating units.

2419 (POEF-M–19) **Power circuit breaker test system.** Deck, J.W.; Kidder, J.S. Martin Marietta Energy Systems, Inc., Piketon, OH (USA). Mar 1988. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-76OR00001. (CONF-880379–2: DOE maintenance management conference, New Orleans, LA (USA), 28 Mar - 1 apr 1988). Order Number DE90002230. Available from NTIS, PC A03/MF A01 - OSTI.

The intended use of this instrument is to make timing and velocity measurements on switchyard power circuit breakers. Previous systems used for this task utilized a controller to actuate the breaker, condition the pole closure and position transducer inputs, and operate a high speed speed visicorder oscillograph that recorded the input responses: the timing and velocity measurements were done manually using the visicorder output. The system developed at Martin Marietta is designed around a ruggedized IBM PC/XT compatible computer and a monochrome CRT display. The computer acts on the operator commands to actuate the breaker and then acquires the pole closure and transducer data during the operation. The computer then serves as the display controller to present the graphical results on the CRT. The operator can now make automated

timing and velocity measurements from the on screen display. A dot matrix printer is provided for a hard copy record of the CRT display. 5 figs., 1 tab.

2420 (CONF-8903173–1) **Fluid/particle separation and coal cleaning: Progress, potential advances, and their effects on FGD [flue-gas desulfurization].** Livengood, C.D.; Doctor, R.D. Argonne National Lab., IL (USA). [1989]. 8p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. From Annual conference on filtration and separation; Pittsburgh, PA (USA); 27-29 Mar 1989. Order Number DE90002249. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Argonne National Laboratory (ANL) has been investigating several approaches to SO_2 and NO_x control that could play significant roles in future emission-control strategies. These techniques include greater application of an existing technology, physical coal cleaning (PCC), as a precombustion complement to FGD, and the combined removal of NO_x and SO_2 in flue-gas cleanup (FGC) systems based on spray drying (a wet/dry process) or in-duct injection of dry sorbents. This paper discusses the results of some of that research with particular attention to the beneficial role of fabric filtration in the dry and wet/dry FGC processes. 7 refs., 5 figs.

2421 (CONF-8904289–1) **Combined NO_x/SO_2 control technology.** Harkness, J.B.L.; Livengood, C.D. Argonne National Lab., IL (USA). 1989. 25p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. From Solutions '89 international conference; Pine Mountain, GA (USA); 30 Apr - 3 may 1989. Order Number DE90002272. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Commercially available control technology for NO_x and SO_2 typically involves separate systems for each pollutant, thereby greatly increasing system complexity. Research and development programs are currently working on a number of integrated technologies that offer the promise of removing both pollutants from boiler flue gases in a single system. This paper will review the commercially available processes and will then describe those integrated systems under development in terms of operational principles, the hardware required, byproducts, costs (if available), and developmental status. 26 refs., 15 figs.

2422 (DOE/PC/79796–T7) **Enhancing the use of coals by gas reburning-sorbent injection: Quarterly report No. 7, December 1, 1988–February 28, 1989.** Energy and Environmental Research Corp., Irvine, CA (USA). 23 Mar 1989. 68p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-87PC79796. Order Number DE90002869. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The objective of this project is to evaluate and demonstrate a cost effective emission control technology for acid rain precursors, oxides of nitrogen (NO_x) and sulfur (SO_x), on three coal fired utility boilers in Illinois. The units selected are representative of pre-NSPS design practices: tangential, wall, and cyclone fired. The specific objectives are to demonstrate reductions of 60 percent in NO_x and 50 percent in SO_x emissions, by a combination of two developed technologies, gas reburning (GR) and sorbent injection (SI). With GR, about 80–85 percent of the coal is fired in the primary combustion zone. The balance of the fuel is added downstream as natural gas to create a slightly fuel rich environment in which NO_x is converted to N_2. The combustion process is completed by overfire air addition. SO_x emissions are reduced by injecting dry sorbents (usually calcium based) into the upper furnace, at the superheater exit or into the ducting following the air heater. The sorbents trap SO_x as solid sulfates and sulfites. 8 figs., 15 tabs.

2423 (DOE/PC/88868–T3) **Characterization and modification of particulate properties to enhance filtration performance: Quarterly technical progress report, December 1988–February 1989.** Snyder, T.R.; Vann Bush, P. Southern Research Inst., Birmingham, AL (USA). 20 Mar 1989. 39p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88868. (SRI-ENV–89-208-6666). Order Number DE90001947. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An abstract search and review of pertinent articles were completed as part of activity 3.1. A summary of the review is included in this report. Testing procedures have been established for the turbulent mixing and combination of two types of fly ash in the mixing and conditioning chamber that was designed and fabricated under activity 3.2. Additional analyses of unconditioned ashes have occurred this quarter under activity 3.3. Relatively cohesive ash from Gulf Power's Plant Scholz in Sneads, Florida, was obtained during this quarter under Task 2, and has been analyzed in the laboratory. Some additional tests of the noncohesive Monticello ash were also performed. Several potential conditioning agents have been identified and include fine powders such as talc, silica, calcium hydrogen phosphate, colloidal aluminum oxide, and selected fly ashes. Several grades of finely ground silica powders have been obtained for conditioning studies. The evaluation of conditioning agents has proceeded this quarter with the analyses of ammonium sulfate products, unconditioned ashes resuspended and collected in the mixing and conditioning chambers, ashes conditioned with ammonium sulfate, and two dissimilar ashes mixed at various ratios. 7 figs., 3 tabs.

2424 (DOE/PC/88874–T6) **Theoretical approach for enhanced mass transfer effects in-duct flue gas desulfurization processes: Quarterly report No. 5, July 1–September 30, 1989.** Acurex Corp., Research Triangle Park, NC (USA). Environmental Systems Div. 26 Oct 1989. 43p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88874. Order Number DE90002757. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During this reporting period, July 1, 1989 through September 30, 1989, bench-scale experiments have been conducted to measure the mass transfer and kinetic rates at simulated duct injection conditions. Section 2 summarizes the tank reactor test results. The stirred tank reactor (Task 2.1) was found to be able to simulate a droplet having a diameter of 180 μm if a 1 s contact time were specified. Experiments were run with different lime types. Tests with 0.1 M Mississippi hydrate and 0.1 M Mississippi slaked lime were run for comparison with 0.1 M reagent $Ca(OH)_2$ slurry. No significant differences in reactivity were measured among these 3 limes. Additional tests with Mississippi hydrate were run to evaluate the effect of slurry solids content on SO_2 removal. Clear solution saturated with $Ca(OH)_2$ was tested as the baseline followed by tests with 0.1 M and 0.4 M $Ca(OH)_2$ slurry. Section 3 reports the status of differential reactor (Task 2.2) tests. The differential reactor apparatus and methods are being modified to determine the effect of initial water content on the sorbent reactivity. Section 4 describes the status of short-time differential reactor (STDR) tests for Task 2.3. Several sorbents were produced using Mississippi CaO with surface area ranging from 29–75 m^2/g and porosity ranging from 29–49 percent. 24 figs., 4 tabs.

2425 (EPRI-EN–6518-Vol.2) **EMDEX [Electric and Magnetic Field Digital EXposure] system manuals: Volume 2: Technical reference manual.** Electric Power Research Inst., Palo Alto, CA (USA); Enertech Consultants, Campbell, CA (USA). c Oct 1989. 140p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The EPRI Electric and Magnetic Field Digital EXposure (EMDEX) system consists of hardware and software for characterizing electric and magnetic field exposures. The EMDEX meter is a computer-based portable unit that samples, at a user-programmable rate, the three vector components of magnetic flux density, a measure of the average electric field acting on the torso of the wearer (if an optional sensor is worn) and a measure of rotational motion of the meter in the earth's magnetic field. Modules of the DATACALC software package are used to program the EMDEX, retrieve data at the end of a measurement session, analyze EMDEX data, and prepare tabular and graphical data summaries. The User Manual is designed to provide instruction on the use of the exposure system hardware and software. The Technical Reference Manual provides additional, detailed descriptions of the hardware, software and methodologies used in the EMDEX system.

2426 (ETDE-mf–0717865) **Flue gas denitrification processes using tissue filters. Final report.** Technische

Universitaet Muenchen, Lehrstuhl fuer Thermische Kraftanlagen mit Heizkraftwerk. Bericht. Geppert, D. Technische Univ. Muenchen (Germany, F.R.). Lehrstuhl fuer Thermische Kraftanlagen mit Heizkraftwerk; Deutsche Forschungsgemeinschaft, Bonn (Germany, F.R.). Jul 1988. 101p. (In German). DFG Th 249/7-1. Order Number DE90717865. Available from NTIS (US Sales Only), PC A06/MF A01.

For clarifying the role of fly ashes as catalysts for the reduction of nitric oxides with ammonia, there was an investigation of fly ashes from power stations fired with lignite or hard coal as well as from refuse incineration plants. First, the measurement of the NO_x separation efficiency took place in a fixed bed reactor and then in a laboratory scale fluidized bed reactor at temperatures of 100-450$_0$C. The degree of nitrogen removal in the fixed bed was very low. Some of the tested fly ashes did not show any reaction in the fluidized bed. Others showed considerable degrees of NO_x separation only at temperatures of 300-400^{0}C. The separation efficiency of these fly ashes rose up to the limit of the temperature range used for testing. In some special cases, a separation efficiency of 40% or more than 90% at temperatures of 450^{0}C was measured. The other fly ashes reached a separation efficiency of 10-30%. The NO_x separation observed is mainly due to a reduction of the NO by the unburnt elements of the fly ashes. A catalytic effect with regard to the reaction between NO and NH_3 could not be proved. The ammonia concentration has, an influence on the dentrification degree in the upper temperature range only in a few fly ashes. (orig./EF).

2427 (ETDE-mf–0717889) **The DESONOX flue gas purification process.** Ohlms, N. Stadtwerke Muenster G.m.b.H. (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). [1989]. 16p. (In German). BMFT 0326564A. Order Number DE90717889. Available from NTIS (US Sales Only), PC A03/MF A01.

The DESONOX method is a combined method for the of removal of sulphur and nitrogen from flue gases from power stations, which provides as final product a sulphuric acid that can be used in industry. It was fully developed by Degussa (Frankfurt) in cooperation with Lentjes (Duesseldorf) and Lurgi (Frankfurt) as well as the Stadtwerke Muenster. The first large-scale DESONOX pilot plant for the purification of the waste gases from block 3 of the combined heat and power station of the Stadtwerke Muenster was realized in a construction time of only 14 months. This pilot plant, which is promoted by the Federal Minister for Research and Technology (BMFT), is presently being put into operation. The article reports on first operational experiences. (orig.).

2428 (NEI-DK–218) **Measurements of gas concentrations and temperature in a boiler room.** Energiministeriets Varmepumpeforskningsprogram. Rapport, 68. Boll Illerup, J.; Dam-Johansen, K. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Kemiteknik. Jul 1989. 31p. (In Danish). Order Number DE90719047. Available from NTIS (US Sales Only), PC A03/MF A01.

Energiministeriets Varmepumpeforskningsprogram. Rapport, 68.; EFP-86.

The most significant sources of air pollution by nitrogen oxides are coal-fired power stations and cars. In Denmark, a law has been past which forces power staions to reduce NOx emission by legally determining a quota of allowed content of nitrogen oxides in flue gasses. Emission of this chemical can be reduced with the help of combustion control techniques. This method is much cheaper than desulphurization of flue gasses and is therefore currently of considerable interest. The method is based upon the reduction of oxygen concentration in, and the temperature of, the flame. In connection with design and optimization of these techniques interest currently centres on methods for measuring the local temperature and gas concentrations in the boiler's combustion chamber. The project concentrates on temperature and gas concentration measurements (CO, NOx, SO2 and CO2) in relation to excess of air and boiler load and emphasis is laid on the evaluation of the actual measuring methods. (AB) 10 refs.

2429 (ORNL/FTR–3473) **[US Agency for International Development–Government of India collaborative coal projects]: Foreign trip report, October 21, 1989–November 2, 1989.** Krishnan, R.P. Oak Ridge National Lab., TN (USA). 17 Nov 1989. 28p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE90003286. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Under the Phase II, Alternative Energy Resources Development (AERD) project, of the United States Agency for International Development (USAID) and the Government of India (GOI), five collaborative coal projects have been initiated in the areas of: (1) NO_x/SO_2 control from coal-fired power plants, (2) slagging combustor development for high-ash Indian coals, (3) characterization of Indian coals for combustion and gasification, (4) diagnostic studies for prediction of power plant life expectancy, and (5) environmental and natural resource analysis of coal cycle. The Pittsburgh Energy Technology Center (PETC) has the implementation responsibility for these projects. The Oak Ridge National Laboratory (ORNL) is providing cross-cut technical coordination and support for these five projects.

2430 (PB–89-218218/XAB) **Development of the advanced utility simulation model. Report for May 1985-September 1988.** Capone, R.L.; Jones, L.G. Science Applications International Corp., McLean, VA (USA). 1989. 17p. Available from NTIS, PC A03/MF A01.

This paper discusses the development of the Advanced Utility Simulation Model (AUSM), developed for the National Acid Precipitation Assessment Program, to forecast air emissions of pollutants from electric utilities. AUSM integrates generating unit engineering detail with dynamic strategic decisions made by utility planners and coal miners. Decisions about capacity additions and emissions control strategies for one unit, state, and year influence (and are influenced by) decisions made for other units, states, and years. Emissions control economics are controlled by unit-specific factors and by market factors. Designed as a cost-minimization model, AUSM integrates decisions about each unit with decisions about other units through competition for coal, interstate electricity transmission, intrastate system dispatch, and power pool, state, and unit-level emissions limits.

2431 **Environmental issues associated with coal-fired power plants in India.** Ravindram, M. *Transactions of the American Nuclear Society (USA),* 57: 82-83 (1988). (CONF-881011–: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

Per capita energy consumption has come to be regarded as an index of a country's economic development. Impressive strides have been made in the capacity to generate electricity. Increasing industrialization and rapid urbanization appear to be the two primary factors responsible for this tremendous spurt in energy demand. Electricity is the most preferred form of energy because of its versatility, convenience, and cleanliness. A major share of electricity generation comes from the use of fossil fuels, particularly coal. While electricity is clean energy at the point of consumption, its generation through coal-fired thermal power plants is beset by severe environmental concerns. In facts, coal-based thermal power plants constitute a formidable source of solid, liquid, and gaseous emissions into the environment. Many of these environmental problems are inherent in the technology itself with no easy solutions. Consequently, proper siting, choice of appropriate control technology, and an in depth analysis of environmental impact are essential to ensure a healthy development and to minimize concomitant environmental deterioration.

2432 (ANL–88-37) **Practical superconductor development for electrical power applications: Annual report for FY 1988.** Poeppel, R.B. Argonne National Lab., IL (USA). Feb 1989. 54p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. Order Number DE90001804. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Development of useful high-temperature superconductors (HTSCs) requires synthesis of the various superconducting oxide compounds; fabrication of wires, tapes, and thin films from these

compounds; capability of forming composite structures that incorporate integral insulators or stabilizers; and design of efficient components and systems. This report documents research efforts aimed at producing superconducting components based on the oxide systems Y–Ba–Cu–O, Bi–Sr–Ca–Cu–O, and Tl–Ca–Ba–Cu–O. Topics discussed are synthesis of compounds from each system; fabrication of monolithic tapes, wires, and castings; effects of silver additions on mechanical and electrical properties; fabrication of composite tapes that incorporate silver or ceramic substrates; use of pressure or electrochemical bonding to connect the superconductors to high-conductivity metals; fabrication of thin films for electronic devices; optimization of heat treatment schedules; the microstructural, mechanical, and electrical properties of the forms produced; and studies on the thermomagnetic stabilities of HTSCs and the implications for system design. Collaborations in this research between Argonne National Laboratory, universities, industrial partners, and other national laboratories are identified and results from the collaborations are presented. The report closes with an assessment of the status of the research efforts as of September 1988. 53 refs., 37 figs., 1 tab.

2433 (PB–89-872360/XAB) **Lightning, surge, and transient protection. December 1982-September 1989 (Citations from the NTIS data base). Report for December 1982-September 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 142p. Available from NTISPC N01/MF N01.

Supersedes PB–88-867775.

This bibliography contains citations concerning techniques and devices for the protection of electronic and electrical equipment from lightning and electrical surges, and data and protective devices for lightning strikes on structures, ships, and aircraft. The citations include research on suppressors, limiters, lightning arresters, electromagnetic pulse protection devices, and overvoltage protectection networks. Excluded are references to electromagnetic shielding, which are found in a separate published search. (This updated bibliography contains 260 citations, 20 of which are new entries to the previous edition.)

21 NUCLEAR POWER PLANTS

2434 (IAEA-TECDOC–507) **Power reactor information system (PRIS). Reference and on-line access manual.** International Atomic Energy Agency, Vienna (Austria). Jun 1989. 83p. Order Number DE90608683. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Since the very beginning of commercial operation of nuclear power plants, the nuclear power industry worldwide has accumulated more than 5000 reactor years of experience. The IAEA has been collecting Operating Experience data for Nuclear Power Plants since 1970 which were computerized in 1980. The Agency has undertaken to make Power Reactor Information System (PRIS) available on-line to its Member States. The aim of this publication is to provide the users of PRIS from their terminals with description of data base and communication systems and to show the methods of accessing the data.

2435 (INIS-mf–12011) **Development of methods for the evaluation and reduction of risk factors for the maintenance of nuclear power plants.** Preuss, W.; Ogurek, K.H. Technischer Ueberwachungs-Verein Rheinland e.V., Koeln (Germany, F.R.). Inst. fuer Unfallforschung und Ergonomie (IfU); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). 1988. 203p. (In German). Contract BMFT 1500 735/3. Order Number DE90722065. Available from NTIS (US Sales Only), PC A10/MF A01.

The maintenance of a nuclear power plant is an essential requirement for its safe operation. Recent experience has however revealed increasingly more deviations and disturbances associated with maintenance work - in particular related to human error. The investigations should contribute to the further improvement of the conditions for safe and optimal maintenance procedures and thus minimize the risk of disturbances arising from them. The first step of the investigation is presented here, in which the methodological preliminary work was carried out and a suitable procedure developed. A basis was provided by means of extensive literature research and analysis. Additional information was obtained through discussions with experts (research workers as well as plant operational management). In particular suitable techniques of investigation and analysis are presented in detail, the problem structure of the field of investigation bas been worked out, and a methodology for the evaluation of data has been developed. Furthermore criteria have been formulated with which nuclear power plants and maintenance processes can be choosen for an economic way of investigation, and a procedure is presented which serves the investigator to check and to improve the methodology. Finally, proposals for further investigations are given. (orig.).

2436 (YJT–89-08) **Recent decommissioning experiments - a literature survey. Quarterly report 3. quarter 1987.** Salonen, Pentti. Voimayhtioeiden Ydinjaetetoimikunta, Helsinki (Finland). Jun 1989. 55p. (In Finnish). Order Number DE90608689. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

The decommissioning plans of the Finnish nuclear power plants shall be dated every five years. Therefore it is important to follow the international scientific and technological progress in the field and to utilize the practical experiences. This study is a general survey of the decommissioning projects of foreign nuclear power plants. The best documented and reported decommissioning projects, Shippingport (USA), JPDR (Japan), KKN (FRG) and WAGR (UK) are dealt with greater detail. The types and operations histories of the nuclear facilities are described and the considerations affecting decommissioning choices (immediate or deferred dismantlement) are also related. These considerations are not generally applicable, but they are always determined in accordance with the national policy and regulations as well as the design of the nuclear facility. The activity estimates are facility specific and depending on the reactor type and operating history and not directly on rated power. The radiation doses to the workers depend mainly on dismantling techniques and radiological protection measures used in decommissioning. Generally the doses remain below estimates.

2437 (CONF-8910222–5) **Human factors survey of advanced instrumentation and controls.** Carter, R.J. Oak Ridge National Lab., TN (USA). 1989. 22p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 17. water reactor safety information meeting; Rockville, MD (USA); 23-25 Oct 1989. Order Number DE90002477. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A survey oriented towards identifying the human factors issues in regard to the use of advanced instrumentation and controls (I&C) in the nuclear industry was conducted. A number of United States (US) and Canadian nuclear vendors and utilities were participants in the survey. Human factors items, subsumed under the categories of computer-generated displays (CGD), controls, organizational support, training, and related topics, were discussed. The survey found the industry to be concerned about the human factors issues related to the implementation of advanced I&C. Fifteen potential human factors problems were identified. They include: the need for an advanced I&C guideline equivalent to NUREG-0700; a role change in the control room from operator to supervisor; information overload; adequacy of existing training technology for advanced I&C; and operator acceptance and trust. 11 refs., 1 tab.

2438 (EGG-M–89186) **In-core thermal hydraulic and fission product calculations for severe fuel damage analyses.** Suh, K.Y.; Sharon, A.; Hammersley, R.J. EG and G Idaho, Inc., Idaho Falls, ID (USA); Fauske and Associates, Inc., Burr Ridge, IL (USA). May 1989. 33p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-891103–38: Winter meeting of the American Nuclear Society, San Francisco, CA (USA), 26-30 Nov 1989). Order Number DE90002068. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Best-estimate calculations of realistic source terms are presented which reduce uncertainties in predicting fission product release from the UO_2 fuel over the temperature range between 770 K and 3000 K. The proposed method of correlation includes such fuel morphology effects as equiaxed fuel grain growth and fuel-cladding interaction. The method correlates the product of fuel release rate and equiaxed grain size with the inverse fuel temperature to yield a bulk mass transfer correlation. It was found that less and slower releases are predicted utilizing the bulk mass transfer correlation than such conventional literature correlations as the steam oxidation model and the NUREG-0956 correlation. A Severe Fuel Damage (SFD) analysis code was developed to perform the thermal hydraulic and fission product calculations needed to analyze the Power Burst Facility SFD tests. The predictions utilizing the bulk mass transfer correlations overall followed the experimental time-release histories during the course of the heatup, power hold and cooldown phases of the transients. Good agreements were achieved for the integral releases both in timing and in magnitude. The proposed bulk mass transfer correlations can be applied to both current and advanced light water reactor fuels. 17 refs., 8 figs., 3 tabs.

2439 (JAERI-M–89-070) **BWR plant dynamic analysis code BWRDYN user's manual.** Yokobayashi, Masao; Yoshida, Kazuo; Fujiki, Kazuo. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 99p. (In Japanese). Order Number DE90719541. Available from NTIS (US Sales Only), PC A05/MF A01.

Computer code BWRDYN has been developed for thermal-hydraulic analysis of a BWR plant. It can analyze the various types of transient caused by not only small but also large disturbances such as operating mode changes and/or system malfunctions. The verification of main analytical models of the BWRDYN code has been performed with measured data of actual BWR plant. Furthermore, the installation of BOP (Balance of Plant) model has made it possible to analyze the effect of BOP on reactor system. This report describes on analytical models and instructions for user of the BWRDYN code. (author).

2440 (PNL–6732) **Design and operation of gamma scan and fission gas sampling systems for characterization of irradiated commercial nuclear fuel.** Knox, C.A.; Thornhill, R.E.; Mellinger, G.B. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 31p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC06-76RL01830. Order Number DE90001862. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

One of the primary objectives of the Materials Characterization Center (MCC) is to acquire and characterize spent fuels used in waste form testing related to nuclear waste disposal. The initial steps in the characterization of a fuel rod consist of gamma scanning the rod and sampling the gas contained in the fuel rod (referred to as fission gas sampling). The gamma scan and fission gas sampling systems used by the MCC are adaptable to a wide range of fuel types and have been successfully used to characterize both boiling water reactor (BWR) and pressurized water reactor (PWR) fuel rods. This report describes the design and operation of systems used to gamma scan and fission gas sample full-length PWR and BWR fuel rods. 1 ref., 10 figs., 1 tab.

2441 (CNEN-DR–88/80/A) **Determination of the protection set-points lines for the Angra-1 reactor core.** Furieri, E.B. Comissao Nacional de Energia Nuclear, Rio de Janeiro, RJ (Brazil). Dept. de Reatores. Mar 1980. 193p. (In Portuguese). (GNT–02/80). Order Number DE90608697. Available from NTIS (US Sales Only), PC A09/MF A01 - OSTI; INIS.

In this work several thermo-hidraulic calculation were performed to obtain Protection set-points lines for the Angra-1 reactor core in order to compare with the values presented by the vendor in the FSAR. These lines are the locus of points where $DNBR_{min}$= 1,3 and power = 1,18 x $P_{nominal}$ as a function of ΔT_m and T_m, the temperature difference and the average coolant temperature between hot and cold legs. A computation scheme was developed using COBRA-IIIF as a subroutine of a new main program and adding new subroutines in order to obtain the desired DNBR. The solution is obtained through a convergentce procedure using parameters estimated in a sensivity study. (author).

2442 (CONF-8910274–2) **Irradiation embrittlement of the shippingport neutron shield tank.** Chopra, O.K.; Shack, W.J. Argonne National Lab., IL (USA). Aug 1989. 23p. Sponsored by Nuclear Regulatory Commission. DOE Contract W-31109-ENG-38. From 15. MPA seminar on safety and reliability of plant technology; Stuttgart (Germany, F.R.); 5-6 Oct 1989. Order Number DE90001942. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The irradiation embrittlement of the Shippingport neutron shield tank material has been characterized. The results indicate embrittlement of the A212 grade B steel from low-temperature, low-flux environment. However, the shifts in Charpy transition temperature are lower than those for the HFIR surveillance samples. The data agree well with results from high flux test reactors. Annealing studies indicate complete recovery of embrittlement after a 2-h anneal at 400°C. 10 refs., 12 figs., 1 tab.

2443 (EPRI-NP–5708-Vol.1-Rev.1) **Determination of thermodynamic data for modeling corrosion: Volume 1, Sulfates (Revision 1): Final report.** Izatt, R.M.; Christensen, J.J.; Oscarson, J.L.; Gillespie, S.E. Electric Power Research Inst., Palo Alto, CA (USA); Brigham Young Univ., Provo, UT (USA). c Nov 1989. 125p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The aqueous reactions, $H^+ + SO_4^{2-} = HSO_4^-$, $Na^+ + SO_4^{2-} = NaSO_4^-$, and $H^+ + HSO_4^- = H_2SO_4(aq)$, were studied as a function of ionic strength (I) at 150, 175, 200, 250, 300, and 320°C using a flow calorimetric procedure. Log K, ΔH, ΔS, and ΔC_p values at I = O were derived from the data at each temperature. Using these experimental values, equations describing log K, ΔH, ΔS, and ΔC_p at I = O and temperatures from 150 to 320°C were derived for each system. The use of equations containing identical numbers of positive and negative charges on both sides of the equal sign (isocoulombic reaction principle) was evaluated as a technique for the extrapolation of log K values valid below 100°C to temperatures above 150°C. This evaluation indicated that the principle gives good estimates up to 320°C. 9 refs., 15 figs., 8 tabs.

2444 (EPRI-NP–5708-Vol.2) **Determination of thermodynamic data for modeling corrosion: Final report, Volume 2: Chlorides and acetates.** Izatt, R.M.; Christensen, J.J.; Oscarson, J.L.; Gillespie, S.E. Electric Power Research Inst., Palo Alto, CA (USA); Brigham Young Univ., Provo, UT (USA). c Nov 1989. 163p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The aqueous reactions, $H^+ + Cl^- = HCl$, $H^+ + Ac^- = HAc$, and $Na^+ + Ac^- = NaAc$ ($Ac = C_2H_3O_2^-$), were studied as a function of ionic strength at 275, 300, and 320°C using a flow calorimetric procedure. Log K, ΔH, and ΔS were determined from the fits of the calculated and experimental heats while ΔC_p values were calculated from the variation of ΔH values with temperature. The log K and ΔH values for the first two reactions agree well with literature values at these temperatures. No previous results have been reported for the third reaction. The use of equations containing identical numbers of positive and identical numbers of negative charges on both sides of the equal sign (isocoulombic reaction principle) was applied to the log K values determined in this study. The resulting plots of log K for the isocoulombic reactions vs 1/T were approximately linear, which demonstrates that the ΔC_p values for these reactions are approximately zero. 65 refs., 20 figs., 8 tabs.

2445 (EPRI-NP–6528) **Deposition of cobalt on surface-treated stainless steel under PWR conditions.** Lister, D.H.; Anderson, P.G.; Barry, B.J.; Lavoie, R.G. Electric Power Research Inst., Palo Alto, CA (USA); Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. c Oct 1989. 60p.

Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

As part of an on-going program aimed at reducing radiation exposures in light water reactors, the modification of surfaces to minimize their propensity to pick up radioactivity under reactor conditions has been studied. This report describes how stainless steel specimens, surface-treated with a variety of processes, picked up Co-60 from high-temperature water under PWR conditions in a high-pressure loop. The build-up of activity was monitored on-line with a movable gamma spectrometer. Off-line counting at the end of the experiment established the absolute activity levels, and selective examinations with SEM and metallography characterized the surface condition of the exceptional specimens. The effectiveness of the surface treatments was gauged by fitting simple parabolae to the activity build-up data and comparing the coefficients with those obtained from untreated control specimens. 10 refs., 23 figs., 4 tabs.

2446 (INIS-BR–1713) **Considerations about the uncertainty propagation in the probabilistic safety analysis.** Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia. 1982. 39p. (In Portuguese). Order Number DE90608701. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Considerations about uncertainties propagation in the probabilistic safety analysis of nuclear power plants.

2447 (INIS-BR–1714) **Event tree for the Angra 1 big LOCA.** Oliveira, L.F.S. de. Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia. 1982. 42p. (In Portuguese). Order Number DE90608702. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The detailed discussion of event tree for the big LOCA in Angra 1 is presented. The emphasis is given to the qualitative analysis of the tree.

2448 (INIS-BR–1715) **Reliability study of low pressure recirculation system of Angra 1.** Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia. 1989. 57p. (In Portuguese). Order Number DE90608703. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

The reliability analysis of Low Pressure Recirculation System (LPRC) for Angra-1 reactor is presented.

2449 (Juel-Spez–488) **Program of research and development on the thorium utilization in PWRS. Final report (1979-1988).** Bilateral seminars of the International Bureau, Kernforschungsanlage Juelich GmbH. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Internationales Buero. 1988. 235p. Order Number DE90722226. Available from NTIS (US Sales Only), PC A11/MF A01.

Detailed investigations performed for a standard 1,300 MW_e PWR show that $(Th,U)O_2$ and $(Th,Pu)O_2$ fuels can be inserted in 3 and 4 cycle operating schemes without modifications in the fuel assembly or core design. The most important aspects of the fuel cycle have been covered. Ex-gel pelletizing of $(Th,U)O_2$ fuel making use of available LWR and HTR fuel manufacturing technology was demonstrated. The most promising application for Th-based fuels at present was proved to be the use of recycle plutonium in extended burnup once-through fuel cycle. The program was performed in a cooperative way between Brazilian and German partners. (orig.).

2450 (STUK-A–86) **Studies of potential severe accidents in Finnish nuclear power plants. Quarterly report 3. quarter 1987.** Aro, Ilari. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland); Helsinki Univ. of Technology, Otaniemi (Finland). Jul 1989. 38p. Order Number DE90608737. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This thesis is based on six publications dealing with severe accident studies in Finnish nuclear power plants. Main emphasis has been put on general technical bases and methodologies applied in severe accident evaluation in Finland. As an example of the use of the analysis and evaluation methods, the analysis of one representative accident sequence, 'otal loss of AC power' has been presented for both Finnish power plant types. This accident sequence is required to be analyzed in the Finnish safety guide YVL 2.2 which deals with transient and accident analyses as a basis of technical solutions at nuclear powr plants. Two different analysis methods, MAAP 3.0 and MARCH 3/STCP have been used for receiving as complete a picture as possible of the flow of events and for verifying the models to some extent. Besides the use of the two different models, the method of sensitivity analysis has been used for evaluating the effects of some important technical parameters on the accident flow. Finally, conclusions of the applicability of the two methods for analyzing severe accident sequences in Finnish plants have been discussed.

2451 (STUK-B-YTO–54) **Operation of Finnish nuclear power plants. Quarterly report, 2. quarter 1988.** Koponen, H. and others. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Dept. of Nuclear Safety. Dec 1988. 23p. Order Number DE90608738. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Same report published in Finnish as STUK-B-YTO–50.

This general review of the operation of the Finnish nuclear power plants concentrates on such events and discoveries related to nuclear and radiation safety as the regulatory body, the Finnish Centre for Radiation and Nuclear Safety, regards as noteworthy. The report also includes a summary of the radiation safety of the personnel and the environment, as well as tabulated data on the production and load factors of the plants. In the report period, no event essentially degraded plant safety nor posed a radiation hazard to the personnel or the environement.

2452 (STUK-B-YTO–56) **Operation of Finnish nuclear power plants. Quarterly report, 3. quarter 1988.** Koponen, H. and others. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Dept. of Nuclear Safety. Feb 1989. 24p. Order Number DE90608739. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Same report published in Finnish as STUK-B-YTO–53.

This general review of the operation of the Finnish nuclear power plants concentrates on such events and discoveries related to nuclear and radiation safety as the regulatory body, the Finnish Centre for Radiation and Nuclear Safety, regards as noteworthy. The report also includes a summary of the radiation safety of the personnel and the environment, as well as tabulated data on the production and load factors of the plants. In the report period, no event essentially degraded plant safety nor posed a radiation hazard to the personnel or the environment.

2453 (JAERI–1318) **Heat and momentum transfer in a gas coolant flow through a circular pipe in a high temperature gas cooled reactor.** Ogawa, Masuro. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1989. 49p. (In Japanese). Order Number DE90719604. Available from NTIS (US Sales Only), PC A03/MF A01.

In Japan Atomic Energy Research Institute (JAERI), a very high temperature gas cooled reactor (VHTR) has been researched and developed with a purpose of attaining a coolant temperature of around 1000degC at the reactor outlet. In order to design VHTR, comprehensive knowledge is required on thermo-hydraulic characteristics of laminar-turbulent transition, of coolant flow with large thermal property variation due to temperature difference, and of heat transfer deterioration. In the present investigation, experimental and analytical studies are made on a gas flow in a circular tube to elucidate the thermo-hydraulic characteristics. Friction factors and heat transfer coefficients in transitional flows are obtained. Influence of thermal property variation on the friction factor is qualitatively determined. Heat transfer deterioration in the turbulent flow subjected to intense heating is experimentally found to be caused by flow laminarization. The analysis based on a k-kL two-equation model of turbulence predicts well the experimental results on friction factors and heat transfer coefficients in flows with thermal property variation and in laminarizing flows. (author).

2454 (JAERI-M-89-064) **Study on shaft vibration of gas circulators with gas-bearings for HENDEL helium test facility.** Shimomura, Hiroaki; Kawaji, Satoshi; Fujisaki, Katsuo; Ihizuka, Takayuki. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 96p. (In Japanese). Order Number DE90719510. Available from NTIS (US Sales Only), PC A05/MF A01.

The gas circulator is a very important component in Gas-Cooled Reactor system. As the coolant helium gas of HTGR is low density, multi-stage compression or high-speed driving are required for the coolant circulator to produce the required head. The gas circulators for large scale HTGRs with mechanical and buffer-gas sealing in the shaft penetration had encountered troubles at the part more or less. On the other hand, smaller scale electric driven gas circulators with gas bearings as used for HENDEL and former DRAGON reactor enable fully encased construction and provide easier maintainability, however, those types of the circulator need highly precise machining, adjustment and superior operational techniques. Moreover, practical rotor weight seems to be limited up to around 150kg for the gas-bearing machinery. The fine dynamic mass-balancing of the rotor becomes extremely difficult in the large gas-bearing machine. The whirling phenomena of the journal tend to originate and to grow approaching the rotating frequency to the first bending natural frequency or the third critical speed of the rotor. In spite of many efforts and works on instability of the gas-bearing system, concrete or practical condition and countermeasure to the instability have not clarified. Present report describes the experimental result on shaft vibration and bearing characteristics of typical gas circulators among the five machines which have gas-bearings and are largest class in those types. It is clarified through the experiments that the fine dynamic balancing of the rotor, dynamic response of the bearing pads and gas-film thickness in the bearing clearance are extremely important to suppress the instability. However, it is also found that too much difficulties make them impractical in these machines. So one might conclude that the countermeasure with fine sensing technique of the half-speed whirling must be practical and useful. (author).

2455 (ORNL/FTR-3420) **[Safety related reactor physics calculation for HTGR type reactors]: Foreign trip report, October 3, 1989–October 7, 1989.** Cleveland, J.C. Oak Ridge National Lab., TN (USA). 21 Oct 1989. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90002154. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

To address certain needs for validation data for gas-cooled reactors, a series of criticals are being planned at the PROTEUS facility at the Paul Scherrer Institute (PSI) in Wuerenlingen, Switzerland. The International Atomic Energy Agency is establishing a Coordinated Research Program (CRP) to provide a means for interested member countries to participate in the PROTEUS review.

2456 (PB-89-215453/XAB) **Environmental radionuclide concentrations in the vicinity of the peach bottom atomic power station: 1985-1986. Data report.** Domotor, S.L.; McLean, R.I. Maryland Power Plant Research Program, Annapolis, MD (USA). Jul 1989. 69p. (PPRP/PPER-R-11). Available from NTIS, PC A04/MF A01.

See also PB-88-192521.

High-resolution gamma spectroscopy was used to determine radionuclide concentrations in over 450 biota and sediment samples collected from the Susquehanna River-Chesapeake Bay system in the vicinity of the Peach Bottom Atomic Power Station (PBAPS) during 1985-1986. Low concentrations of PBAPS-related radionuclides (Zn65, Cs-134, and Cs-137) were detected in finfish, mussels, and crayfish. These PBAPS-related radionuclides and Co-60 were also detected in sediments. I-131 attributable to the Chernobyl reactor accident (April 26, 1986) was detected in environmental samples collected in May 1986. PBAPS-related radionuclide concentrations in biota and sediments represent small increments to the Susquehanna River-Chesapeake Bay system relative to natural and weapons test levels; radionuclide releases by PBAPS, and radiation doses to man, are well within regulatory limits.

2457 (BNL-43367) **Tensile and impact testing of an HFBR [High Flux Beam Reactor] control rod follower.** Czajkowski, C.J.; Schuster, M.H.; Roberts, T.C.; Milian, L.W. Brookhaven National Lab., Upton, NY (USA). Aug 1989. 92p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC02-76CH00016. Order Number DE90002310. Available from NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

The Materials Technology Group of the Department of Nuclear Energy (DNE) at Brookhaven National Laboratory (BNL) undertook a program to machine and test specimens from a control rod follower from the High Flux Beam Reactor (HFBR). Tensile and Charpy impact specimens were machined and tested from non-irradiated aluminum alloys in addition to irradiated 6061-T6 from the HFBR. The tensile test results on irradiated material showed a two-fold increase in tensile strength to a maximum of 100.6 ksi. The impact resistance of the irradiated material showed a six-fold decrease in values (3 in-lb average) compared to similar non-irradiated material. Fracture toughness (K_I) specimens were tested on an unirradiated compositionally and dimensionally similar (to HFBR follower) 6061 T-6 material with K_{max} values of 24.8 $\pm$ 1.0 Ksi$\sqrt{in}$ (average) being obtained. The report concludes that the specimens produced during the program yielded reproducible and believable results and that proper quality assurance was provided throughout the program. 9 figs., 6 tabs.

2458 (CONF-8909141-3) **Conversion feasibility studies for the Grenoble high flux reactor.** Mo, S.C.; Matos, J.E. Argonne National Lab., IL (USA). [1989]. 23p. Sponsored by U.S. Arms Control and Disarmament Agency; U.S. DOE Management & Administration. DOE Contract W-31109-ENG-38. From 12. international meeting on reduced enrichment for research and test reactors; Berlin (Germany, F.R.); 10-13 Sep 1989. Order Number DE90001442. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Feasibility studies for conversion of the High Flux Reactor (RHF) at Grenoble France have been performed at the Argonne National Laboratory in cooperation with the Institut Laue-Langevin (ILL). The uranium densities required for conversion of the RHF to reduced enrichment fuels were computed to be 7.9 g/cm^3 with 20% enrichment, 4.8 g/cm^3 with 29% enrichment, and 2.8 g/cm^3 with 45% enrichment. Thermal flux reductions at the peak in the heavy water reflector were computed to be 3% with 45% enriched fuel and 7% with 20% enriched fuel. In each case, the reactor's 44 day cycle length was preserved and no changes were made in the fuel element geometry. If the cladding thickness could be reduced from 0.38 mm to 0.30 mm, the required uranium density with 20% enrichment would be about 6.0 g/cm^3 and the thermal flux reduction at the peak in the heavy water reflector would be about 7%. Significantly higher uranium densities are required in the RHF than in heavy water reactors with more conventional designs because the neutron spectrum is much harder in the RHF. Reduced enrichment fuels with the uranium densities required for use in the RHF are either not available or are not licensable at the present time. 6 refs., 6 figs., 3 tabs.

Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 13. annual TRADE conference; Baltimore, MD (USA); 22-25 Oct 1989. Order Number DE90002775. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This document describes the process used by Argonne National Laboratory (ANL) Training/Procedures personnel at Experimental Breeder Reactor 2 (EBR-II) to develop a Self-Evaluation Report for the Nuclear Power Plant Operator training program. The document also describes problems encountered and lessons learned during development of the Self-Evaluation Report. 5 refs., 2 tabs.

2461 (JAERI-M–89-060) **Fabrication of uranium-plutonium mixed carbide fuel pins for JMTR irradiation capsules, 84F-10A, 84F-12A and 87F-2A.** Arai, Yasuo; Iwai, Takashi; Maeda, Atsushi and others. Japan Atomic Energy Research Inst., Tokyo (Japan). May 1989. 19p. (In Japanese). Order Number DE90719473. Available from NTIS (US Sales Only), PC A03/MF A01.

Five uranium-plutonium mixed carbide fuel pins were fabricated for the irradiation tests of JMTR in order to demonstrate performance of advanced fuels for FBR. Mixed carbide pellets with low densities (81-86 %TD) were packed in the cladding tubes of 316-type stainless steel having 9.4 mmD in outer diameter with one atmosphere of He gas. The characteristics of the fuel pellets prepared were well clarified. The performance of the fuel pins was confirmed by the inspections such as leak test, X-ray radiography, microscopy of welded section and check of surface contamination. (author).

2462 (JAERI-M–89-069) **Design study of high breeding fast reactor. FP gas purge/tube-in-shell metallic fuel fast reactor.** Hiraoka, Toru; Sako, Kiyoshi; Takano, Hideki; Osakabe, Masahiro; Ishii, Takeshi; Sato, Mitsuru; Hirota, Koichi; Konishi, Takao. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 214p. (In Japanese). Order Number DE90719530. Available from NTIS (US Sales Only), PC A10/MF A01.

Aiming to increase fuel breeding capability as the most essential feature of fast breeders, an idea of the FP gas purge/tube-in-shell type metallic fuel assembly is proposed. It makes volume fraction of fuel high as more than 50% and realizes a very hard neutron spectrum in the core. The structure of the fuel assembly, its fabrication and the FP gas purging mechanism were assessed and it is clarified that the new concept of the fuel assembly is engineeringly feasible. FP gas purging does not affect shielding structure and can be managed by a small scale cover-gas treatment system because of good trapping characteristics of bonding sodium in the assembly as expected. The fuel handling system without forced cooling is possible. Other reactor components such as IHX were also evaluated. Thus, a concept of the total reactor system of a fast breeding reactor of 670 MWe with the ultra-high breeding ratio of 1.84 and the short reactor doubling time of 6.7 years was obtained. (author).

2463 **Fuel/sodium reaction product formation in breached mixed-oxide fuel.** Bottcher, J.H.; Lambert, J.D.B.; Strain, R.V.; Ukai, S.; Shibahara, S. *Transactions of the American Nuclear Society (USA)*, 57: 86-88 (1988). (CONF-881011–: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

The run-beyond-cladding-breach (RBCB) operation of mixed-oxide liquid-metal reactor fuel pins has been studied for 6 yr in the Experimental Breeder Reactor II (EBR-II) as part of a joint program between the US Department of Energy and the Power Reactor and Nuclear Fuel Development Corporation of Japan. The formation of fuel-sodium reaction product (FSRP), Na_3MO_4, where $M = U_{1-y}Pu_y$, in the outer fuel regions is the major phenomenon governing RBCB behavior. It increases fuel volume, decreases fuel stoichiometry, modifies fission product distributions, and alters thermal performance of a pin. This paper describes the morphology of Na_3MO_4 observed in 5.84-mm-diam pins covering a variety of conditions and RBCB times up to 150 effective full-power days (EFPDs).

2465 (GKSS–89/E/13) **Irradiation programs to establish the safety margins of German licensing rules related to RPV steel embrittlement.** Ahlf, J.; Bellmann, D.; Schmitt, F.J. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). 1989. 17p. Available from Reprint from ASTM STP 1011, L.E. Steele (ed.), American Society for Testing and Materials, Philadelphia, 1989, p. 115-129.

Under German licensing rules, irradiation-induced embrittlement of a reactor pressure vessel (RPV) in the core belt region is taken into account basically by determining the shift of the 41-J transition temperature of the Charpy impact energy versus temperature curve and then adjusting either the exclusion line of the modified Porse diagram, or the K_{IR} curve, by this 41-J shift. The accuracy limits of $T_{41\ J}$ and $\Delta T_{41\ J}$ determination are discussed and quantified. The transition temperature concept is shown to be conservative in the validity range of the respective licensing rules because of the uncertainties in $\Delta T_{41\ J}$ determination. Investigations with respect to irradiation effects on fracture toughness deserve high priority in current programs. Results from a A 533-B^2 steel (HSST03) are presented, and the shift of the K_{Ic} curve is evaluated for two fluence levels. Experiments related to the question of whether neutron flux density has an influence on embrittlement are briefly reported. (orig.).

22 NUCLEAR REACTOR TECHNOLOGY

2201 Theory and Calculation

Refer also to citation(s) 2488, 3186, 4121

2470 (CEA-N–2605) **Parallel algorithms for solving the diffusion equation by finite elements methods and by nodal methods.** Coulomb, F. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques. Jun 1989. 382p. (In French). Order Number DE90721137. Available from NTIS (US Sales Only), PC A17/MF A01.

The aim of this work is to study methods for solving the diffusion equation, based on a primal or mixed-dual finite elements discretization and well suited for use on multiprocessors computers; domain decomposition methods are the subject of the main part of this study, the linear systems being solved by the block-Jacobi method. The origin of the diffusion equation is explained in short, and various variational formulations are reminded. A survey of iterative methods is given. The elemination of the flux or current is treated in the case of a mixed method. Numerical tests are performed on two examples of reactors, in order to compare mixed elements and Lagrange elements. A theoretical study of domain decomposition is led in the case of Lagrange finite elements, and convergence conditions for the block-Jacobi method are derived; the dissection decomposition is previously the purpose of a particular numerical analysis. In the case of mixed-dual finite elements, a study is led on examples and is confirmed by numerical tests performed for the dissection decomposition; furthermore, after being justified, decompositions along axes of symmetry are numerically tested. In the case of a decomposition into two subdomains, the dissection decomposition and the decomposition with an integrated interface are compared. Alternative directions methods are defined; the convergence of those relative to Lagrange elements is shown; in the case of mixed elements, convergence conditions are found.

2471 (JAERI-M–89-091) **Thermal-hydraulics of actinide burner reactors. Conceptual study of actinide burner reactors, (3).** Takizuka, Takakazu; Mukaiyama, Takehiko; Takano, Hideki; Ogawa, Toru; Osakabe, Masahiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1989. 43p. (In Japanese). Order Number DE90719606. Available from NTIS (US Sales Only), PC A03/MF A01.

As a part of conceptual study of actinide burner reactors, core thermal-hydraulic analyses were conducted for two types of reactor concepts, namely (1) sodium-cooled actinide alloy fuel reactor, and (2) helium-cooled particle-bed reactor, to examine the feasibility of high power-density cores for efficient transmutation of actinides within the maximum allowable temperature limits of fuel and cladding. In addition, calculations were made on cooling of actinide fuel assembly. (author).

2472 (ORNL/tr–89/40) **Horizontal cold source: Fluid dynamics tests on the moderator model in water and air current.** Hoffman, H.; Astruc, J.M. Oak Ridge National Lab., TN (USA). 1989. 37p. Translation of Re 972 N(p) 002, July 1982. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002281. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In addition to the vertical cold source, the high flux reactor is to have another cold source with a deuterium moderator level of 5 liters. At temperature levels of 25 K it produces neutrons in an energy range of < 5 MeV (velocities $\approx$ 600 m/s, wave lengths 6Å) for a variety of experiments. The position of the source must of necessity be horizontal. Inside it a quantity of heat of approximately 3 kW is released, a third of which comes from the moderator itself and two-thirds of which from the enclosure wall. It causes evaporation of the moderator fluid. The D_2 vapor released in this way ($\approx$ 10 g/s) is evacuated from the moderator cell and transported to a helium-cooled condenser, then returned to the source. The condenser is located approximately 4 m above the moderating cell. The D_2 circuit will operate according to the principle of a thermosiphon, which means that the fluid density differences are used to circulate the deuterium. 9 refs., 11 figs.

2473 (ORNL/tr–89/46) **Horizontal cold source friction losses of D_2 model with separate tubes comparison of calculated values to experimental results in D_2.** Hoffmann, H. Oak Ridge National Lab., TN (USA). 1989. 31p. Translation of Re 972 N(p) 031, March 1984. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002282. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Horizontal Cold Source will be located in the H5 channel and produces a quantity of heat of ca. 3 kW, a third of which comes from the moderator and two-thirds of which from the cell walls. Horizontal placement and the available space allow heat evacuation only by evaporation of the moderator, deuterium (saturation pressure: 1.5 bars, saturation temperature: 25 K). The D_2 vapor is transported in a monophase state or in a diphase mixture to the condenser, cooled by helium gas. The condensate and the liquid part of the diphase mixture are recirculated in the cell according to the principle of a thermosiphon. The condenser must be positioned at a sufficiently high level compared to the cell to produce a driving force (liquid column) in order to allow good circulation in the thermosiphon. 8 refs., 15 figs.

2474 **An S_2 synthetic acceleration scheme for the one-dimensional S_{sta} equations with linear discontinuous spatial differencing.** Lorence, L.J. Jr. (Sandia Labs., Albuquerque, NM (USA)); Morel, J.E.; Larsen, E.W. *Nuclear Science and Engineering (USA)*, 101(4): 341-351 (Apr 1989). DOE Contract AC04-76DP00789.

In this paper an S_2 synthetic acceleration scheme is developed for the one-dimensional S_n equations (slab and sphere) with linear discontinuous spatial differencing. A Fourier analysis shows that the scheme is unconditionally stable for a model problem. Computational results demonstrate the effectiveness of the technique for varying cell thickness and scattering anisotropy.

2475 (INIS-BR–1695) **Computer-aided event tree analysis by the impact vector method.** Lima, J.E.P. Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Posgraduacao de Engenharia. 1984. 248p. (In Portuguese). Order Number DE90608656. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

In the development of the Probabilistic Risk Analysis of Angra I, the ' large event tree/small fault tree' approach was adopted for the analysis of the plant behavior in an emergency situation. In this work, the event tree methodology is presented along with the adaptations which had to be made in order to attain a correct description of the safety system performances according to the selected analysis method. The problems appearing in the application of the methodology and their respective solutions are presented and discussed, with special emphasis to the impact vector technique. A description of the ETAP code ('Event Tree Analysis Program') developed for constructing and quantifying event trees is also given in this work. A preliminary version of the small-break LOCA analysis for Angra 1 is presented as an example of application of the methodology and of the code. It is shown that the use of the ETAP code sigmnificantly contributes to decreasing the time spent in event tree analyses, making it viable the practical application of the analysis approach referred above. (author).

2476 (SAND–89-1755C) **Loss-of-coolant accident (LOCA) testing of aged cables for nuclear plant life extension.** Jacobus, M.J. Sandia National Labs., Albuquerque, NM (USA). [1989]. 12p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (CONF-8910222–2: 17. water reactor safety information meeting, Rockville, MD (USA), 23-25 Oct 1989). Order Number DE90002103. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Sandia National Laboratories is conducting long-term aging research on representative samples of nuclear power plant Class 1E cables. The objectives of this program are to determine the suitability of these cables for extended life (beyond 40-year design basis) and to assess various cable condition monitoring (CM) techniques for predicting remaining cable life. Twelve different cable products have been aged for long times at relatively mild exposure conditions in three test chambers to nominal equivalent lifetimes of 20, 40, and 60 years. Following the aging process, the cables in each chamber were exposed to a sequential accident profile consisting of 110 Mrad of high dose rate gamma irradiation followed by a simulated design basis loss-of-coolant accident (LOCA) steam exposure (except the 20-year chamber, which has not yet been LOCA tested). This paper discusses the results of the LOCA testing on the cables aged to 60 years. Although some of the cables experienced electrical failures, the results of these tests indicate a good life extension potential for a number of popular cable products. 3 refs., 12 figs.

2477 (IAERU–8802, pp. 101-117) **Neutron radiography of the irradiated nuclear fuels.** Tsuruno, Akira (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Mar 1989. (In Japanese). (CONF-8806441–: 4. IAERU seminar, Tokyo (Japan), 18 Jun 1988). In *Proceedings of IAERU seminar-4.* Order Number DE90705939. Available from NTIS (US Sales Only), PC A07/MF A01.

Application of neutron radiography in the post-irradiation nondestructive examination of highly activated materials was realized early 1965. There were some reasons, (1) thermal neutrons penetrate easily heavy metals like uranium, (2) by the transfer method the effect of fogging radiation except neutrons can be avoided, (3) presence of research reactors for thermal neutron source. At JAERI, the post-irradiation non-destructive examination in JRR-3 neutron radiography facility was started at 1975. The highly activated materials which were metal natural uranium spent fuels, uranium oxide pellets and mixed oxide pellets in the irradiated capsules, had been transfered from the hot laboratory to the JRR-3 neutron radiography facility. In this report, some examples in the post-irradiation non-destructive examination are given. (author).

2204 Control Systems

2478 (CONF-890555–23) **Faster-than-real-time simulation for plant control.** Larson, H.A.; Dean, E.M.; Lehto, W.K. Argonne National Lab., Idaho Falls, ID (USA). [1989]. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 7. power plant dynamics, control and testing symposium; Knoxville, TN (USA); 15-17 May 1989. Order Number DE90002195. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

As part of the advanced diagnostic prognostic analysis and control system, a faster-than-real-time simulation of the EBR-II reactor has been developed using the Digital Simulator for Nuclear Power Plants (DSNP). Other elements of the system include an expert system, advanced graphics display, real time data acquisition using the EBR-II plant computer and a data transmission system coupling the control computers with the plant and graphics display. Various plant models have been constructed with even the most complicated being able to run plant transients in less-than-real-time. This paper discusses the plant models, necessary code modifications and the results. Depending on degree of model complexity the plant simulations run from 0.067 to 0.75 of the transient time. 6 refs., 1 tab.

2479 (CONF-8910222–6) **Evaluation of check valve monitoring methods.** Haynes, H.D. Oak Ridge National Lab., TN (USA). [1989]. 31p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 17. water reactor safety information meeting; Rockville, MD (USA); 23-25 Oct 1989. Order Number DE90002482. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Check valves are used extensively in nuclear plant safety systems and balance-of-plant (BOP) systems. Their failures have resulted in significant maintenance efforts and, on occasion, have resulted in water hammer, overpressurization of low-pressure systems and damage to flow system components. Consequently, in recent years check valves have received considerable attention by the Nuclear Regulatory Commission (NRC) and the nuclear power industry. Oak Ridge National Laboratory (ORNL) is carrying out a comprehensive two phase aging assessment of check valves in support of the Nuclear Plant Aging Research (NPAR) program. As part of the second phase, ORNL is evaluating several developmental and/or commercially available check valve diagnostic monitoring methods; in particular, those based on measurements of acoustic emission, ultrasonics, and magnetic flux. These three methods were found to provide different (and complementary) diagnostic information. The combination of acoustic emission with either ultrasonic or magnetic flux monitoring yields a monitoring system that succeeds in providing sensitivity to detect all major check valve operating conditions. All three methods are still under development and should improve in many respects as a result of further testing and evaluation. 10 refs., 19 figs., 1 tab.

2480 (EGG-M–88288) **Where to from here? Future applications of mental models of complex performance.** Hahn, H.A.; Nelson, W.R.; Blackman, H.S. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 2p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-881058–7: Human Factors Society annual meeting, Anaheim, CA (USA), 24-28 Oct 1988). Order Number DE90002091. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The purpose of this paper is to raise issues for discussion regarding the applications of mental models in the study of complex performance. Applications for training, expert systems and decision aids, job selection, workstation design, and other complex environments are considered. 1 ref.

2481 (ORNL/FTR–3451) **[Haiden Reactor Project and DOE's Advanced Controls Program: Foreign trip report, October 16, 1989–October 22, 1989.** White, J.D. Oak Ridge National Lab., TN (USA). 6 Nov 1989. 8p. Sponsored by U.S. DOE Nuclear

Energy. DOE Contract AC05-84OR21400. Order Number DE90002659. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Halden research facility in Norway was visited to discuss whether Halden's research would be useful for the Advanced Controls Program. Human-machine research at the Halden might be used to accelerate progress or to lower the cost of the DOE Advanced Controls Program at ORNL

2482 **Reactor Safety Assessment System.** Sebo, D.E. (Idaho National Engineering Lab., Idaho Falls, ID (US)); Bray, M.A.; King, M.A. pp. 910 of Artificial intelligence and other innovative computer applications in the nuclear industry. Majumdar, M.C.; Majumdar, D.; Sackett, J.I American Nuclear Society, La Grange Park, IL (1987). (CONF-870832–: Topical meeting on artificial intelligence and other innovative computer applications in the nuclear industry: present and future, Snowbird, UT (USA), 31 Aug - 2 sep 1987).

The Reactor Safety Assessment System (RSAS) is an expert system under development for the United States Nuclear Regulatory Commission (USNRC). RSAS is designed for use at the USNRC Operations Center in the event of a serious incident at a licensed nuclear power plant. RSAS is a situation assessment expert system which uses plant parametric data to generate conclusions for use by the NRC Reactor Safety Team. RSAS uses multiple rule bases and plant specific setpoint files to be applicable to all licensed nuclear power plants in the United States. RSAS currently covers several generic reactor categories and multiple plants within each category.

2483 **Incorporating fuzzy data and logical relations in the design of expert systems for nuclear reactors.** Guth, M.A.S. (Oak Ridge National Lab., Oak Ridge, TN (US)). pp. 910 of Artificial intelligence and other innovative computer applications in the nuclear industry. Majumdar, M.C.; Majumdar, D.; Sackett, J.I American Nuclear Society, La Grange Park, IL (1987). (CONF-870832–: Topical meeting on artificial intelligence and other innovative computer applications in the nuclear industry: present and future, Snowbird, UT (USA), 31 Aug - 2 sep 1987).

This paper applies the method of assigning probability in Dempster-Shafer Theory (DST) to the components of rule-based expert systems used in the control of nuclear reactors. Probabilities are assigned to premises, consequences, and rules themselves. This paper considers how uncertainty can propagate through a system of Boolean equations, such as fault trees or expert systems. The probability masses assigned to primary initiating events in the expert system can be derived from observing a nuclear reactor in operation or based on engineering knowledge of the reactor parts. Use of DST mass assignments offers greater flexibility to the construction of expert systems in two important respects. First, DST mass assignments have the advantage over classical probability methods of accommodating when necessary uncommitted probability assignments. Thus the DST probability framework can incorporate expert system inputs from imprecise or fuzzy data. Second, DST applied to the Boolean rules themselves leads to a probabilistic logic, where a given rule may be valid with probability less than unity: fuzzy logical rules.

2484 **Prolgraf-B: A knowledge-based system for the automated construction of nuclear plant diagnostic models. .** Guarro, S.B. (Lawrence Livermore National Lab., Livermore, CA (US)). pp. 910 of Artificial intelligence and other innovative computer applications in the nuclear industry. Majumdar, M.C.; Majumdar, D.; Sackett, J.I American Nuclear Society, La Grange Park, IL (1987). (CONF-870832–: Topical meeting on artificial intelligence and other innovative computer applications in the nuclear industry: present and future, Snowbird, UT (USA), 31 Aug - 2 sep 1987).

Automated diagnosis of undesired operational transients in a nuclear power plant process has been an active subject of research for the last ten years. Examples of different approaches to the solution of this problem are the early research on Disturbance Analysis Systems (DASs) and the more recent developments in the area of Automated Emergency Operating Procedures (AEOPs). The early efforts in the field of automated plant process analysis were hindered by the scarcity of efficient modeling tools suits for self-contained representation of typical target processes. For example, the cause-consequence tree methodology used in the DAS prototypes produced event-oriented models. This type of representation required a separate model development effort for each individual event sequence for which a diagnostic capability was desired. The resulting models often lacked flexibility, in that even relatively small deviations of an actual occurrence from a modeled event sequence could compromise the capability by the model and the associated diagnostic software to match and recognize the sequence. A discrete modeling approach, called the Logic Flowgraph Methodology (LFM) and designed to overcome some of these difficulties, has been developed and interaction to be defined as a function of the combination of the vector states of the influencing variables.

2485 (EGG-M–34487) **Verification of the ORIGEN2 code analysis for the TMI-2 reactor core.** Akers, D.W.; Schnitzler, B.G. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1988. 8p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8806143–10: Nuclear reactor severe accident chemistry symposium, Toronto (Canada), 5-10 Jun 1988). Order Number DE90002017. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Accurate definition of the fission product inventories produced in the TMI-2 reactor prior to the accident on March 29, 1979 are of considerable interest to many organizations including the Department of Energy which is shipping the damage reactor core to the Idaho National Engineering Laboratory and conducting the TMI-2 reactor examination program, and General Public Utilities which is defueling the reactor. Numerous fission product inventory calculations have been performed for the TMI-2 core, including an ORIGEN2 analysis by EG&G which uses 1239 nodes to define burnup in the reactor core. To provide a verification of the predicted fission product inventories, a measurement study was performed using pellets from various core regions. Measurements were performed for transuranics, burnup monitors, noble gases, principal gamma ray emitters, ^{129}I, and ^{90}Sr. Comparisons between the experimental results and the code analyses are presented with an evaluation of the associated uncertainties. Also, a discussion is presented of the probable causes of the observed differences between the code and measured values. 10 refs., 1 fig., 2 tabs.

2486 (EGG-M–88154) **Fission product relocation and behavior in the TMI-2 reactor vessel.** Akers, D.W.; McCardell, R.K. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 21p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-881024–16: TMI-2 accident materials behavior, plant technology and recovery, Washington, DC (USA), 30 Oct - 4 nov 1988). Order Number DE90002009. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The purpose of this paper is to summarize the results of the fission product examinations performed on samples from the TMI-2 reactor vessel and to evaluate the chemistry that resulted in the observed behavior. As part of the TMI-2 core examination program, samples were examined from all regions within the reactor vessel, from leadscrews in the top head to prior molten material relocated to the lower plenum of the reactor vessel during the accident. These results indicated significant variations in fission product behavior that were generally consistent with the volatility and chemical behavior of the fission product species. Low volatility species were retained almost entirely in the fuel material matrix (^{144}Ce), whereas unoxidized species (e.g., ^{125}Sb) were found with the metallic structural materials, and there was a significant release of the high volatile species (^{137}Cs and ^{129}I) from the high temperature portions of the fuel. 15 refs., 1 fig., 5 tabs.

2487 (INIS-BR–1744) **Internal progress report of operational environmental monitoring in the region of Pocos de Caldas, MG, Brazil.** Instituto de Radioprotecao e Dosimetria, Rio de Janeiro, RJ (Brazil). [1989]. 55p. (In Portuguese). Order Number DE90608322. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

The operational environmental monitoring plan, done by Instituto de Radioprotecao e Dosimetria (IRD), for Pocos de Caldas region (CIPC) and used until today is described.

2488 (CONF-8909141–7) **The conversion of the 2 MW reactor at the Rhode Island Nuclear Science Center.** DiMeglio, A.F.; Matos, J.E.; Freese, K.E.; Spring, E.F. Argonne National Lab., IL (USA). [1989]. 11p. Sponsored by U.S. Arms Control and Disarmament Agency; U.S. DOE Assistant Secretary for International Affairs and Energy Emergencies; U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 12. international meeting on reduced enrichment for research and test reactors; Berlin (Germany, F.R.); 10-13 Sep 1989. Order Number DE90001759. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The 2 MW Rhode Island Atomic Energy Commission reactor is required to convert from the use of High Enriched Uranium (HEU) fuel to the use of Low Enriched Uranium (LEU) fuel using a standard LEU fuel plate which is thinner and contains more U-235 than the current HEU plate. These differences, coupled with a desire to upgrade the characteristics and capability of the reactor, have resulted in core design studies and thermal hydraulic studies not only at the current 2 MW but also at the maximum power level of the reactor, 5 MW. In addition, during 23 years of operation, it has become clear that the main uses of the reactor have been neutron scattering and neutron activation analysis. The requirement to convert to LEU presents and opportunity to optimize the core for the utilization and to restudy the thermal hydraulics using modern techniques. This paper presents the current conclusions of both aspects. 2 refs., 9 figs.

2489 (CONF-8909141–8) **Interpretation of gamma-scanning data from the ORR demonstration elements.** Bretscher, M.M.; Snelgrove, J.L.; Hobbs, R.W. Argonne National Lab., IL (USA). [1989]. 34p. Sponsored by U.S. Arms Control and Disarmament Agency; U.S. DOE Assistant Secretary for International Affairs and Energy Emergencies. DOE Contract W-31109-ENG-38. From 12. international meeting on reduced enrichment for research and test reactors; Berlin (Germany, F.R.); 10-13 Sep 1989. Order Number DE90001761. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The HEU and LEU fuel elements used in the ORR whole-core demonstration were gamma-scanned to determine the axial distribution of the ^{140}La and ^{137}Cs activities. Analysis of this data is now complete. From the ^{140}La activity distributions cycle-averaged powers were determined while the ^{137}Cs data provided a measure of the final ^{235}U burnup in the fuel elements. A method for calculating correction factors for activity gradients transverse to the fuel element axis is presented and is applied to the first mixed core used in the demonstration during the gradual transition to an all LEU core. Results based on the gamma-scanning of the LEU fuel followers are also presented. Improved burnup calculations against which the experimental results are to be compared are now in progress. 7 refs., 21 figs., 3 tabs.

2490 (EGG-M–88270) **Neutronics design of the INEL [Idaho National Engineering Laboratory] facility for boron neutron capture therapy clinical trials.** Parsons, D.K.; Wheeler, F.J.; Rushton, B.L.; Nigg, D.W. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-880911–35: International reactor physics conference, Jackson Hole, WY (USA), 18-21 Sep 1988). Order Number DE90002010. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The PBF reactor at INEL has been redesigned for BNCT treatment of Gliobiastoma Multiforme. Analysis indicates that the design goals of 1.0E + 10 n/cm^2·s epithermal neutron flux at the beam port can be met without exceeding the design goals of 2.6E -11 J cGy/(n/cm^2) for the fast neutron KERMA and 2.0E-11 cGy/(n/cm^2) for the gamma KERMA. These design goals result in a 10 minute patient treatment time with low nondesirable doses. 12 refs., 5 figs., 1 tab.

2491 (JAERI-M–89-080) **Stabilities of dimension and thermal-resistance of ASR-ORB carbon for thermal barrier materials of HTTR.** Matsuo, Hideto; Saito, Tamotsu; Imai, Hisashi. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 22p. (In Japanese). Order Number DE90719539. Available from NTIS (US Sales Only), PC A03/MF A01.

Dimensional stability as well as thermal-resistivity is one of the important properties for thermal barrier materials to be used in the High-Temperature Engineering Test Reactor (HTTR). Changes in these properties under the reactor operation condition were estimated on ASR-ORB carbon selected as the thermal barrier material. Stabilities of these properties were evaluated from the experimental results and graphitization behavior of the carbon crystallite by heat-treatment. It is indicated that during the reactor operation the dimension shrinkage of the material will be less than 0.1 per cent and that change in the thermal-resistance will remain within the sample-to-sample variation. (author).

2492 (ORNL/TM–11335) **Job/task analysis for I&C [Instrumentation and Controls] instrument technicians at the High Flux Isotope Reactor.** Duke, L.L. Oak Ridge National Lab., TN (USA). Sep 1989. 41p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001847. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

To comply with Department of Energy Order 5480.XX (Draft), a job/task analysis was initiated by the Maintenance Management Department at Oak Ridge National Laboratory (ORNL). The analysis was applicable to instrument technicians working at the ORNL High Flux Isotope Reactor (HFIR). This document presents the procedures and results of that analysis. 2 refs., 2 figs.

2493 **Space applications of fusion energy.** Roth, J.R. (Tennessee Univ., Knoxville, TN (USA). Dept. of Electrical and Computer Engineering). *Fusion Technology (USA)*, 15(3): 1375-1394 (May 1989).

When more than a few hundred kilowatts of steady-state power are required for space applications, the only feasible choices appear to be nuclear fission or nuclear fusion. Space applications places different and usually more stringent constraints on the choice of fusion reactions and fusion confinement systems than do ground-based electric utility applications. These constraints are addressed in this paper. Desirable characteristics of fusion reactors for space are discussed.

2494 **Survivable pulse power space radiator.** Mims, J.; Buden, D.; Williams, K. To Dept. of Energy, Washington, DC. USA Patent 4,832,113. 23 May 1989. Filed date 11 Mar 1988. USA Patent Application 7 167,203. Int. Cl. B64G 1/50;B64G 1/56;B64G 1/44. vp Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a thermal radiator system for use on an outer space vehicle, which must survive a long period of nonuse and then radiate large amounts of heat for a limited period of time. The radiator includes groups of radiator panels that are pivotally connected in tandem, so that they can be moved to deployed configuration wherein the panels lie largely coplanar, and to a stowed configuration wherein the panels lie in a stack to resist micrometeorite damage. The panels are mounted on a boom which separates a hot power source from a payload. While the panels are stowed, warm fluid passes through their arteries to keep them warm enough to maintain the coolant in a liquid state and avoid embrittlement of material.

2495 (BMU–1989-226) **Measures for reduction of severe accident consequences: Comprehensive evaluation of the results sponsored by the BMI.** Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien,

Gutachten. Bracht, K.; Friedrichs, H.G. Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.). 1989. 84p. (In German). Contract BMU SR 361. Available from Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

A number of analytical studies were initial in the past by the Federal Ministry of Interior (BMI) of FRG, to investigate the potential of additional constructive measures for risk reduction. Those measures were proposed especially against uncontrolled overpressurization of the containment due to continuous gas/steam generation, penetration of the foundation of the reactor building by melt-concrete interaction, and failure of the containment due to violent hydrogen combustion. This report gives an overview about those studies and summarizes their results. Concerning uncontrolled overpressurization, only filtered venting may be a reasonable measure, while it seems to make not much sense, to look at measures against penetration of the foundation like 'core-catcher' in further detail. To prevent hydrogen combustion with severe consequences, several potential possibilities exist, but none of them can be considered as a safe measure. Additional analysis concerning hydrogen distribution and combustion in a multi-compartment containment are necessary. All studies mentioned in this report, deal with additional constructive measures to mitigate the consequences of severe accidents. Up to day in FRG, the potential of accident prevention and mitigation of its consequences by still or again operable and already existing systems of a plant have not been investigated in detail. As indicated by first results, the use of those systems in the frame of an appropriate accident management may have a large potential for risk reduction. (orig.).

2496 (BNL–43298) **Development and Testing of a RETRAN/MINET composite code and application to the J.A. Fitzpatrick plant.** Van Tuyle, G.J.; Rohatgi, U.S.; Aronson, A.L.; Chan, B.C.; Mallen, A.N.; Szwarc, K.; Karasulu, M. Brookhaven National Lab., Upton, NY (USA). 1989. 27p. Sponsored by Electric Power Research Institute. DOE Contract AC02-76CH00016. (CONF-8909248–1: 6. international RETRAN meeting, Arlington, VA (USA), 18-20 Sep 1989). Order Number DE90001533. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The development and testing of the RETRAN/MINET Composite Code, based on RETRAN 02 Mod 3 and MINET Version 1.10, are described. The MINET Code was originally developed for the analysis of complex balance of plant (BOP) thermal-hydraulic systems and already serves that purpose in support of RAMONA-3B for BWR analyses and SSC for LMR analyses. The object in developing RETRAN/MINET was to extend the degree to which complex thermal-hydraulic systems can be analyzed, while providing the capability to use detailed RETRAN modeling of the reactor and other components, where needed. Preliminary testing established proper code performance and data transmission, as well as stability under transient conditions. Two test transients postulated for the H.B. Robinson Plant were simulated using a two loop RETRAN/MINET representation extending to the condenser, and the results were compared against those generated using RELAP5. In addition, the RETRAN model was extended directly to the condenser and the transients were re-run. This provided for a three-way comparison between RETRAN/MINET, RELAP5, and RETRAN (alone). The results generated using RETRAN/MINET and RETRAN were very similar, which again indicates that the interface in performing correctly. The RETRAN/MINET representation through the feedwater train excuted about 20% faster than in the RETRAN (alone) case, although more substantial improvements are expected for more complex systems. The principal objective of establishing correct performance of the composite code has been achieved. 9 refs., 19 figs.

2497 (CEA-DAS–539) **International cooperation for operating safety.** Dupuis, M.C. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. Mar 1989. 11p. (In French). (CONF-881014–: International European Nuclear Society/American Nuclear Society meeting on thermal reactor safety, Avignon (France), 2-7 Oct 1988). Order Number DE90721233. Available from NTIS (US Sales Only), PC A03/MF A01.

The international-cooperation organization in nuclear safety domain is discussed. The nuclear energy Direction Committee is helped by the Security Committee for Nuclear Power Plants in the cooperation between security organizations of member countries and in the safety and nuclear activity regulations. The importance of the cooperation between experts in human being and engine problems is underlined. The applied methods, exchange activities and activity analysis, and the cooperation of the Nuclear Energy Agency and international organizations is analysed.

2498 (CEA-DAS–603) **Trend and pattern analysis of operational data through cooperation between OECD countries.** Dupuis, M.C. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. May 1989. 11p. (CONF-8904156–: CSNI-CEC specialist meeting on trends and pattern analyses of operational data from nuclear power plants, Rome (Italy), 3-7 Apr 1989). Order Number DE90721101. Available from NTIS (US Sales Only), PC A03/MF A01.

This paper deals with trend analyses achieved by NEA/OECD countries to assess operational safety experience. It describes the main features of the incident Reporting System operated by NEA to collect relevant safety events from nuclear power plants. It presents the results of exchange methods within Principal Working Group no 1 in charge of operating experience and human factors; the use of preselected IRS incidents is illustrated by the study of losses of containment functions performed by PWGI; some trends resulting from enlarged international exchanges dealing with operational data are highlighted through two examples: reducing scram frequency and improving technical specifications.

2499 (CNEN-DR–112/82) **Procedure to estimate radiation dose in the population in the case of an accident.** Comissao Nacional de Energia Nuclear, Rio de Janeiro, RJ (Brazil). Dept. de Reatores. Jul 1982. 40p. (In Portuguese). Order Number DE90608312. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The methods to estimate radiation doses in the population due to nuclear power plants accidents are presented.

2500 (CONF-890673–5) **LMR design to facilitate control.** Planchon, H.P.; Golden, G.H.; Sackett, J.I.; Singer, R.M.; Mohr, D.; Chang, L.K.; Vilim, R.B.; Feldman, E.E. Argonne National Lab., IL (USA). 1989. 20p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From IWGFR specialists meeting on advanced controls for fast reactors; Argonne, IL (USA); 20-22 Jun 1989. Order Number DE90002211. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Recent testing in the Experimental Breeder Reactor-II (EBR-II) has demonstrated the potential for passively accomplishing basic reactor safety functions. Tests have shown that reactor feedbacks can safely shut down the reactor for loss of flow and loss of heat sink accidents and that natural convection can subsequently cool the reactor without aid of active components. Analysis has indicated that passive safety for the transient overpower and loss of coolant events can also be achieved for a larger LMR with metal fuel. The analyses and experiments suggest that there will be both special constraints and opportunities for the design of automatic control and protection systems for inherently safe reactor plants. The constraints are generally a restriction on the "control band" of active components so that they cannot override the reactivity feedbacks, or natural convective heads which otherwise inherently carry out the safety functions. The opportunities for improvement of reactor controls are generally in two areas. First the complexity of safety systems (which evolves from the philosophy of safety reliability through redundancy, diversity and independence) can be reduced. The reliability and diverse nature of passive shutdown, convective heat removal and hydrostatic mitigation of leaks in the primary boundary allow considerable simplification or deletion of active control and protection system, while at the same time improving reliability of the safety functions. 10 refs., 4 figs.

2501 (CONF-890841–3) **Safety aspects of the US advanced LMR [liquid metal reactor] design.** Pedersen, D.R.; Gyorey, G.L.; Marchaterre, J.F.; Rosen, S. Argonne National Lab., IL (USA). 1989. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From International workshop on

safety of nuclear installations of the next generation and beyond; Chicago, IL (USA); 28-31 Aug 1989. Order Number DE90002175. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The cornerstones of the United States Advanced Liquid Metal Cooled Reactor (ALMR) program sponsored by the Department of Energy are: the plant design program at General Electric based on the PRISM (Power Reactor Innovative Small Module) concept, and the Integral Fast Reactor program (IFR) at Argonne National Laboratory (ANL). The goal of the US program is to produce a standard, commercial ALMR, including the associated fuel cycle. This paper discusses the US regulatory framework for design of an ALMR, safety aspects of the IFR program at ANL, the IFR fuel cycle and actinide recycle, and the ALMR plant design program at GE. 6 refs., 5 figs.

2502 (CONF-890841–4) **Safety aspects of the IFR pyroprocess fuel cycle.** Forrester, R.J.; Lineberry, M.J.; Charak, I.; Tessier, J.H.; Solbrig, C.W.; Gabor, J.D. Argonne National Lab., IL (USA). [1989]. 25p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From International workshop on safety of nuclear installations of the next generation and beyond; Chicago, IL (USA); 28-31 Aug 1989. Order Number DE90002177. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper addresses the important safety considerations related to the unique Integral Fast Reactor (IFR) fuel cycle technology, the pyroprocess. Argonne has been developing the IFR since 1984. It is a liquid metal cooled reactor, with a unique metal alloy fuel, and it utilizes a radically new fuel cycle. An existing facility, the Hot Fuel Examination Facility-South (HFEF/S) is being modified and equipped to provide a complete demonstration of the fuel cycle. This paper will concentrate on safety aspects of the future HFEF/S operation, slated to begin late next year. HFEF/S is part of Argonne's complex of reactor test facilities located on the Idaho National Engineering Laboratory. HFEF/S was originally put into operation in 1964 as the EBR-II Fuel Cycle Facility (FCF) (Stevenson, 1987). From 1964–69 FCF operated to demonstrate an earlier and incomplete form of today's pyroprocess, recycling some 400 fuel assemblies back to EBR-II. The FCF mission was then changed to one of an irradiated fuels and materials examination facility, hence the name change to HFEF/S. The modifications consist of activities to bring the facility into conformance with today's much more stringent safety standards, and, of course, providing the new process equipment. The pyroprocess and the modifications themselves are described more fully elsewhere (Lineberry, 1987; Chang, 1987). 18 refs., 5 figs., 2 tabs.

2503 (CONF-890855–57) **Analysis of fluid-structure interaction and structural response of Chernobyl-4 reactor.** Wang, C.Y.; Pizzica, P.A.; Gvildys, J.; Spencer, B.W. Argonne National Lab., IL (USA). [1989]. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 10. international conference on Structural Mechanics in Reactor Technology (SMIRT); Anaheim, CA (USA); 14-18 Aug 1989. Order Number DE90001770. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

On April 26, 1986, an accident occurred at the Chernobyl-4 Nuclear Power Plant in the Soviet Union. A post accident meeting was held in Vienna during the week of August 25, 1986. In mid-July 1986, the DOE formed a team to analyze the accident, including experts from the national laboratories such as Argonne National Laboratory, Brookhaven National Laboratory, Oak Ridge National Laboratory, and Pacific Northwest Laboratory. The goal was to assess the information's plausibility, provided analytical support to the US delegation during the post-accident review meeting and obtain a technical understanding of the accident. Detailed analyses of the team work are given in Ref. 1 (DOE, 1986). The accident at Chernobyl-4 occurred during the running of a test to determine a turbogenerator's ability to provide in-house emergency power after shutting off its steam supply. The accident was the result of a large, destructive power excursion. The major design related factor in the accident was the large positive void coefficient of reactivity. This feature, not present in the US reactors, means that an increase in power is likely to lead to an increase in reactivity which will further increase power, and finally result in the destructive accident. 5 refs., 11 figs.

2504 (CONF-890855–58) **Advancements in the behavioral modeling of fuel elements and related structures.** Billone, M.C.; Montgomery, R.O.; Rashid, Y.R.; Head, J.L. Argonne National Lab., IL (USA). 1989. 22p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 10. international conference on Structural Mechanics in Reactor Technology (SMIRT); Anaheim, CA (USA); 14-18 Aug 1989. Order Number DE90001768. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

An important aspect of the design and analysis of nuclear reactors is the ability to predict the behavior of fuel elements in the adverse environment of a reactor system. By understanding the thermomechanical behavior of the different materials which constitute a nuclear fuel element, analysis and predictions can be made regarding the integrity and reliability of fuel element designs. The SMiRT conference series, through the division on fuel elements and the post-conference seminars on fuel element modeling, provided technical forums for the international participation in the exchange of knowledge concerning the thermomechanical modeling of fuel elements. This paper discusses the technical advances in the behavioral modeling of fuel elements presented at the SMiRT conference series since its inception in 1971. Progress in the areas of material properties and constitutive relationships, modeling methodologies, and integral modeling approaches was reviewed and is summarized in light of their impact on the thermomechanical modeling of nuclear fuel elements. 34 refs., 5 tabs.

2505 (CONF-890899–2) **Expert system applications in support of system diagnostics and prognostics at EBR-II.** Lehto, W.K.; Gross, K.C. Argonne National Lab., IL (USA). 1989. 27p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From Joint Korea-United States seminar on expert systems for electric power systems and industries; Seoul (Republic of Korea); 13-18 Aug 1989. Order Number DE90002171. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Expert systems have been developed to aid in the monitoring and diagnostics of the Experimental Breeder Reactor-II (EBR-II) at the Idaho National Engineering Laboratory (INEL) in Idaho Falls, Idaho. Systems have been developed for failed fuel surveillance and diagnostics and reactor coolant pump monitoring and diagnostics. A third project is being done jointly by ANL-W and EG&G Idaho to develop a transient analysis system to enhance overall plant diagnostic and prognostic capability. The failed fuel surveillance and diagnosis system monitors, processes, and interprets information from nine key plant sensors. It displays to the reactor operator diagnostic information needed to make proper decisions regarding technical specification conformance during reactor operation with failed fuel. 8 refs., 9 figs., 2 tabs.

2506 (CONF-891140–3) **SASSYS validation with the EBR-II shutdown heat removal tests.** Herzog, J.P. Argonne National Lab., IL (USA). 1989. 22p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From Session on thermal-hydraulic aspects of passive safety and new generalization reactors; San Francisco, CA (USA); 27-30 Nov 1989. Order Number DE90001924. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

SASSYS is a coupled neutronic and thermal hydraulic code developed for the analysis of transients in liquid metal cooled reactors (LMRs). The code is especially suited for evaluating of normal reactor transients – protected (design basis) and unprotected (anticipated transient without scram) transients. Because SASSYS is heavily used in support of the IFR concept and of innovative LMR designs, such as PRISM, a strong validation base for the code must exist. Part of the validation process for SASSYS is analysis of experiments performed on operating reactors, such as the metal fueled Experimental Breeder Reactor – II (EBR-II). During the course of a series of historic whole-plant experiments, EBR-II illustrated key safety features of metal fueled LMRs. These experiments, the Shutdown Heat Removal Tests (SHRT), culminated in unprotected loss of flow and loss of heat sink transients from full power and flow. Analysis of these and earlier SHRT experiments constitutes a vital part of SASSYS validation, because it facilitates scrutiny of specific SASSYS models and of integrated code capability. 12 refs., 11 figs.

2507 (CONF-891140–4) **Inherent controllability in modular ALMRs.** Sackett, J.I.; Sevy, R.H.; Wei, T.Y.C. Argonne National Lab., IL (USA). 1989. 13p. Sponsored by U.S. DOE Nuclear

Energy. DOE Contract W-31109-ENG-38. From Session on thermal-hydraulic aspects of passive safety and new generalization reactors; San Francisco, CA (USA); 27-30 Nov 1989. Order Number DE90001922. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

As part of recent development efforts on advanced reactor designs ANL has proposed the IFR (Integral Fast Reactor) concept. The IFR concept is currently being applied to modular sized reactors which would be built in multiple power paks together with an integrated fuel cycle facility. It has been amply demonstrated that the concept as applied to the modular designs has significant advantages in regard to ATWS transients. Attention is now being focussed on determining whether or not those advantages deriving from the traits of the IFR can be translated to the operational/DBA (design basis accident) class of transients. 5 refs., 3 figs., 3 tabs.

2508 (CONF-8907161–1) **Critical time step estimation for three-dimensional explicit impact analysis.** Kulak, R.F. Argonne National Lab., IL (USA). [1989]. 9p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From Structures under shock and impact conference; Cambridge, MA (USA); 11-13 Jul 1989. Order Number DE90002187. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A method to obtain a bound on the critical time step of impact problems that employ explicit integration and penalty type contact elements is presented. The method uses a Gerschgorin bound obtained from a partially assembled stiffness matrix for the nodes that belong to elements involved in the contact region. A numerical example is presented to illustrate the method's effectiveness. 6 refs., 4 figs., 1 tab.

2509 (CONF-8909263–1) **Fission energy: The integral fast reactor.** Chang, Yoon I. Argonne National Lab., IL (USA). [1989]. 17p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. From 6. edition of the University of Gandia summer colloquium; Valencia (Spain); 4-9 Sep 1989. Order Number DE90001760. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Integral Fast Reactor (IFR) is an innovative reactor concept being developed at Argonne National Laboratory as a such next-generation reactor concept. The IFR concept has a number of specific technical advantages that collectively address the potential difficulties facing the expansion of nuclear power deployment. In particular, the IFR concept can meet all three fundamental requirements needed in a next-generation reactor as discussed below. This document discusses these requirements.

2510 (CONF-8910222–3) **Power reactor embrittlement data base.** Kam, F.B.K.; Stallmann, F.W.; Wang, J.A. Oak Ridge National Lab., TN (USA). [1989]. 10p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 17. water reactor safety information meeting; Rockville, MD (USA); 23-25 Oct 1989. Order Number DE90001975. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Regulatory and research evaluations of embrittlement prediction models and of vessel integrity under load can be greatly expedited by the use of a well-designed, computerized embrittlement data base. The Power Reactor Embrittlement Data Base (PR-EDB) is a comprehensive collection of data from surveillance reports and other published reports of commercial nuclear reactors. The uses of the data base require that as many different data as available are collected from as many sources as possible with complete references and that subsets of relevant data can be easily retrieved and processed. The objectives of this NRC-sponsored program are the following: to compile and to verify the quality of the PR-EDB; to provide user-friendly software to access and process the data; to explore or confirm embrittlement prediction models; and to interact with standards organizations to provide the technical bases for voluntary consensus standards that can be used in regulatory guides, standard review plans, and codes. 9 figs.

2511 (CONF-8910222–4) **Aging assessment of auxiliary feedwater systems.** Casada, D.A. Oak Ridge National Lab., TN (USA). 1989. 14p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 17. water reactor safety information meeting; Rockville, MD (USA); 23-25 Oct 1989. Order Number DE90002478. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A study of Pressurized Water Reactor Auxiliary Feedwater (AFW) Systems has been conducted by Oak Ridge National Laboratory (ORNL) under the auspices of the Nuclear Regulatory Commission's Nuclear Plant Aging Research Program. The study has reviewed historical failure experience and current monitoring practices for the AFW System. This paper provides an overview of the study approach and results. 7 figs.

2512 (CONF-8910239–5) **The development and revision of the Federal Radiological Emergency Response Plan.** Gant, K.S.; Adler, M.V.; Wolff, W.F. Oak Ridge National Lab., TN (USA). [1989]. 9p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. From 13. annual TRADE conference; Baltimore, MD (USA); 22-25 Oct 1989. Order Number DE90002711. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Since 1985, federal agencies have been using the Federal Radiological Emergency Response Plan (FRERP) in exercises and real events. This experience and the development of other emergency response guidance (e.g., National System for Emergency Coordination) are fueling current efforts to review and revise the FRERP to reflect what the agencies have learned since the FRERP was published. Revision efforts are concentrating on clarifying the plan and addressing deficiencies. No major changes are expected in the general structure of the federal response nor should states need to revise their plans because of these modifications. 5 refs.

2513 (CONF-8910274–1) **Embrittlement of cast stainless steels in LWR systems.** Chopra, O.K.; Chung, H.M. Argonne National Lab., IL (USA). Aug 1989. 34p. Sponsored by Nuclear Regulatory Commission. DOE Contract W-31109-ENG-38. From 15. MPA seminar on safety and reliability of plant technology; Stuttgart (Germany, F.R.); 5-6 Oct 1989. Order Number DE90001928. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Mechanical property data from Charpy-impact and J-R curve tests are presented for several experimental and commercial heats, as well as reactor-aged material of CF-3, CF-8, and CF-8M grades of cast stainless steel. The effects of material variables on the embrittlement of cast stainless steels are evaluated. The chemical composition and ferrite morphology have a strong effect on the extent and kinetics of embrittlement. The data are analyzed to establish the mechanisms of embrittlement. The procedure and correlations for predicting the impact strength and fracture toughness of cast components during reactor service are described. The lower bound values of impact strength and fracture toughness for low-temperature aged cast stainless steel are defined. 13 refs., 13 figs., 3 tabs.

2514 (DOE/EH–0101) **Technical Safety Appraisal of the Fast Flux Test Facility, Westinghouse Hanford Company.** US-DOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (USA). Oct 1989. 82p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90001892. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This report presents the findings and concerns from the second Technical Safety Appraisal of the Fast Flux Test Facility. The appraisal was conducted during site visits of August 7–11 and August 21–30, 1989. The first Technical Safety Appraisal was conducted in February–March 1986. The Fast Flux Test Facility is located on the US Department of Energy Hanford Site near Richland, Washington, and is operated by the Westinghouse Hanford Company. This facility was designed specifically for irradiation testing of nuclear reactor fuels and materials for liquid-metal-fast-breeder reactors. The term Fast Flux Test Facility includes the reactor as well as the equipment and structures for heat removal, containment, core component handling and examination, instrumentation and control, and for supplying utilities and services such as emergency power generation and irradiated fuel storage.

2515 (DOE/ID–10216-Vol.6) **DOE modifications to the MAAP [Modular Accident Analysis Program] code: Volume 6, Core melt progression modeling and benchmarking WBS 3.4.8.** Plys, M.G.; Wu, Chun-Der; Epstein, M.; Hammersley, R.J. EG and G Idaho, Inc., Idaho Falls, ID (USA); Fauske and Associates, Inc., Burr Ridge, IL (USA). Aug 1989. 115p. Sponsored by U.S. DOE

Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE90002006. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

This report presents an enhanced model for the MAAP code that addresses fuel-cladding interaction and core mass relocation during core degradation. The main purpose of this work is to assess the potential for in-vessel hydrogen production and to reduce the uncertainty in fission product source term evaluation. The model provides a description of fuel behavior in which the fuel comprises uranium dioxide, zirconium dioxide, and U-Zr-O compounds. The composition of the U-Zr-O compounds and their solidus and liquidus temperatures are calculated throughout the core melt transient. The interaction of control rod materials with fuel and cladding and the relocation of control rod materials are not addressed in this enhanced model. The enhanced core melt progression model has been applied to a hypothetical station blackout accident with a small break via the reactor coolant pump seals. The new model has been benchmarked against both the LOFT experiment LP-FP-2 and the TMI-2 accident prior to the B-loop pump restart. Although some uncertainties and deviations were seen, general agreement was obtained with the experimental data and with the TMI-2 accident. 21 refs., 30 figs.

2516 (EGG-EAST–8546) **Course A—Numerical modeling of two-phase flows for presentation at Ecole d'Ete d'Analyse Numerique.** Ransom, V.H. EG and G Idaho, Inc., Idaho Falls, ID (USA). May 1989. 376p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8906249–1: Summer school on numerical analysis, Saclay (France), 12-23 Jun 1989). Order Number DE90002074. Available from NTIS, PC A17/MF A01; OSTI; INIS; GPO Dep.

This course is designed to provide an introduction to the application of two-fluid modeling techniques to two-phase or, more generally, multiphase flows, and to the numerical methods that have been developed for solution of such problems. The methods that are presented have evolved to a large extent as a result of international efforts to improve the understanding of light-water-reactor transient response to postulated loss of coolant accidents. Transient simulation codes that are based on these methods are now in routine use throughout the international light-water-reactor safety research and regulatory organizations. 159 refs., 54 figs., 8 tabs.

2517 (EGG-M–32787) **Modeling of thermal hydraulic behavior and fission product releases in degraded cores.** Sharon, A.; Ellison, P.G.; Henry, R.E.; Kenton, M.A.; Hammersley, R.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 8p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-880309–8: International symposium on severe accidents in nuclear power plants IAEA - OECD/NEA, Sorrento (Italy), 21-25 Mar 1988; IAEA-SM–296/80). Order Number DE90001999. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

When core material reaches melting conditions severe degradation of the core geometry occurs. Data available on the core behavior in a severely degraded state suggest that extensive blockage of the flow channels would occur. If a sufficient bypass is available for the gas flow, such as in the LOFT LP-FP-2 test, severe retardation of the hydrogen and fission product sources from the degraded channel is suggested from the available data. This phenomena is expected to occur in an LWR core and should be considered by core models that are used for severe accident analysis. In the MAAP code it is done by preventing gas flow through molten core regions. Good agreement is obtained with all relevant data that are directly applicable to LWR accident conditions. A more mechanistic model for the freezing of core material and its effect on the coolant channel geometry is currently being investigated by the US Department of Energy Advanced Reactor Severe Accident Program (ARSAP). 8 refs., 2 figs.

2518 (EGG-M–36787) **Scale model test results for an inverted U-tube steam generator with comparisons to heat transfer correlations.** Boucher, T.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1987]. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-871234–16: ASME winter meeting, Boston, MA (USA), 13-18 Dec 1987). Order Number DE90002003. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

To provide data for assessment and development of thermal-hydraulic computer codes, bottom main feedwater-line-break transient simulations were performed in a scale model (Semiscale Mod-2C) of a pressurized water reactor (PWR) with conditions typical of a PWR (15.0 MPa primary pressure, 600 K steam generator inlet plenum fluid temperatures, 6.2 MPa secondary pressure). The state-of-the-art measurements in the scale model (Type III) steam generator allow for the determination of U-tube steam generator allow for the determination of U-tube steam generator secondary component interactions, tube bundle local radial heat transfer, and tube bundle and riser vapor void fractions for steady state and transient operations. To enhance the understanding of the observed phenomena, the component interactions, local heat fluxes, local secondary convective heat transfer coefficients and local vapor void fractions are discussed for steady state, full-power and transient operations. Comparisons between the measurement-derived secondary convective heat transfer coefficients and those predicted by a number of correlations, including the Chen correlation currently used in thermal-hydraulic computer codes, show that none of the correlations adequately predict the data and points out the need for the formulation of a new correlation based on this experimental data. The unique information presented herein should be of the interest to anyone involved in modeling inverted U-tube steam generator thermal-hydraulics for forced convection boiling/vaporization heat transfer. 5 refs., 13 figs., 1 tab.

2519 (EGG-M–88156) **Just how much water is required to cool a molten core?.** Langer, S. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-881024–17: TMI-2 accident materials behavior, plant technology and recovery, Washington, DC (USA), 30 Oct - 4 nov 1988). Order Number DE90001995. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The tacit assumption in early severe accident studies was that the melting of a reactor core would result in failure of the reactor pressure vessel and eventually failure of the containment building and release of fission products to the environment. This assumption was shown to be wrong by the TMI-2 accident in which 50% of the core melted, yet fission product release to the environment was insignificant. Survival of the reactor vessel is attributed to the presence of water in the vessel. The quantity of water required to cool the molten core and reestablish stable core cooling is calculated and the implications of these results for future accident management are discussed. 12 refs.

2520 (EGG-M–88163) **TMI-2 data qualification and data bases.** Golden, D.W.; Anderson, J.L.; Brower, R.W.; Fackrell, L.J.; McCormick, R.D. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 30p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-881024–18: TMI-2 accident materials behavior, plant technology and recovery, Washington, DC (USA), 30 Oct - 4 nov 1988). Order Number DE90002044. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

TMI-2 data are of great interest to the scientific community, since the March, 1979 accident represents the only occurrence of a transient resulting in severe fuel damage in a full-scale commercial production reactor. This paper discusses the data sources available for accident analyses. Techniques to qualify and quantify time series measurement and sample data which have been collected and evaluated to this time are discussed. Data base products are described which have been developed for use by analysts investigating the many aspects of the accident. Applications processing features have been incorporated into the software designs to provide the end user with many useful capabilities in sorting, viewing and analyzing the data; data base discussions emphasize these features. 14 refs., 5 figs.

2521 (EGG-M–88275) **Development of an aging evaluation and life extension program for the Advanced Test Reactor.** Dwight, J.E. Jr. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 8p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-880748–13: American Nuclear Society topical meeting on nuclear power plant life extension, Snowbird, UT (USA), 31 Jul - 3 aug 1988). Order Number DE90002013. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A life extension program has been developed for the US Department of Energy's Advanced Test Reactor. The program is an adaptation of life extension pilot programs at the Surry Unit 1 and Monticello generating stations and is being completed in three phases. In Phase 1, the critical plant components were identified. In Phase 2, existing lifetime analyses and support data for the critical components were reviewed. The results from the review give a preliminary indication that an overall plant lifetime in excess of forty years is feasible. In Phase 3, now in progress, detailed evaluations for component life extensions are being performed. 2 refs., 2 figs., 1 tab.

2522 (EGG-M–88300) **Aging evaluation of electrical circuits using the ECCAD [Electrical Circuit Characterization and Diagnostics] system.** Edson, J.L. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 8p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-880824–5: International nuclear power plant aging symposium, Bethesda, MD (USA), 30 Aug - 1 sep 1988). Order Number DE90002075. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

As a part of the Nuclear Regulatory Commission Nuclear Plant Aging Research Program, an aging assessment of electrical circuits was conducted at the Shippingport Atomic Power Station Decommissioning Project. The objective of this work was to evaluate the effectiveness of the Electrical Circuit Characterization and Diagnostic (ECCAD) system in identifying circuit conditions, to determine the present condition of selected electrical circuits, and correlate the results with aging effects. To accomplish this task, a series of electrical tests was performed on each circuit using the ECCAD system, which is composed of commercially available electronic test equipment under computer control. Test results indicate that the ECCAD system is effective in detecting and identifying aging and service wear in selected electrical circuits. The major area of degradation in the circuits tested was at the termination/connection points, whereas the cables were in generally good condition. 1 ref., 8 figs., 1 tab.

2523 (EGG-M–88428) **Quality Assurance in the removal and transport of the TMI-2 core.** Hayes, G.R.; Marsden, J.F. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 24p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-881011–41: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988). Order Number DE90002031. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

EG&G Idaho, acting on behalf of the US Department of Energy (DOE), is cooperating with the owner of the TMI-2 plant, General Public Utilities Nuclear (GPUN), in the removal and transport of the damaged TMI-2 core to the Idaho National Engineering Laboratory (INEL) near Idaho Falls, Idaho. Quality Assurance (QA) played an important role in the removal and transport of the damaged TMI-2 core. To illustrate, the authors have chosen to discuss some of the important quality assurance techniques utilized in the design, fabrication, acceptance, and use of the three different types of equipment; the core boring machine, the core debris canisters, and the transport casks. Rather than a thorough discussion of the QA aspects of each task, the authors have purposely chosen to present only the key applications of quality assurance principles and methodology unique to each piece of equipment. The intent of this approach is to effectively communicate the importance of "task teamwork" in QA.

2524 (EGG-M–88438) **Comparison of thermal and mechanical responses of the TMI-2 reactor vessel.** Thinnes, G.L. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 31p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-881011–42: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988). Order Number DE90002032. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The TMI-2 accident resulted in approximately 40% of the reactor's core melting and collecting on the lower head of the reactor pressure vessel. The severity of the accident has raised questions about the margin of safety against rupture of the lower head in this accident since all evidence seems to indicate no major breach of the vessel occurred. Scoping heat transfer analyses of the relocated core debris and lower head have been made based upon assumed core melting scenarios and core material debris formations while in contact with the lower head. 7 refs., 16 figs.

2525 (EPRI-NP–4574-CCM-Pt.2-Ch.5-Vol.1) **ARMP-02 documentation: Part 2, Chapter 5, EPRI-PRESS computer code manuals: Volume 1, Theory and numerics.** Mosteller, R.D. Electric Power Research Inst., Palo Alto, CA (USA); Levy (S.), Inc., Campbell, CA (USA). c Oct 1989. 244p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

EPRI-PRESS is a computer program that automates the ARMP PWR calculational path. The CELL-2, NUPUNCHER-2, APLB, GAD, and PDQ7-E modules, which previously functioned as stand-alone codes, are combined into a single application which generates cross sections and other data for eventual use in the nodal programs SIMULATE-E and NODE-P2. In addition, the cross sections so generated can be input to stand-alone PDQ7-E calculations. Based on internal procedures, the CELL-2 module generates cross sections and other data for normal fuel pins, non-fuel regions, lumped burnable poison rods, and gadolinia-loaded fuel pins. "Generic" control-rod cross sections for a variety of PWR assembly designs are stored internally and can be used if the user so chooses. The NUPUNCHER-2, APLB, and GAD modules process the data from CELL-2 into input for the PDQ7-E module, performing transport-to-diffusion parameterizations where necessary. EPRI-PRESS contains case lists for so-called "one-temperature" and "three-temperature" models, and it will execute cases for whichever one of these models the user specifies. EPRI-PRESS builds input, executes all the specified cases, manages all data files, and produces a binary integral file which can be processed by the NORGE-P linkage code into input for either SIMULATE-E or NODE-P2. By doing so, it dramatically reduces the amount of effort and time required to perform these functions. It also simplifies traceability through the reduction of input and the use of automated data management. 89 refs., 16 figs., 23 tabs.

2526 (EPRI-NP–6496) **Lower-bound magnitude for probabilistic seismic hazard assessment: Final report.** McCann, M.W. Jr.; Reed, J.W. Electric Power Research Inst., Palo Alto, CA (USA); Benjamin (J.R.) and Associates, Inc., Mountain View, CA (USA). c Oct 1989. 378p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This report provides technical information to determine the lower-bound earthquake magnitude (LBM) for use in probabilistic seismic hazard (PSH) computations that are applied to nuclear plant applications. The evaluations consider the seismologic characteristics of earthquake experience at similar facilities and insights from probabilistic risk analysis. The recommendations for LBM satisfy the two basic precepts: (1) there is a reasonable engineering assurance that the likelihood of damage due to earthquakes smaller than the LBM is negligible, and (2) any small risk due to earthquakes smaller than the LBM is compensated by conservatisms in PSH results for larger earthquakes. Theoretical and empirical ground motion studies demonstrate that ground shaking duration and spectral shape are a strong function of earthquake magnitude. Small earthquakes have short duration and spectral shapes centered at high frequencies as compared to nuclear power plant design spectra which are typical of moderate and large earthquakes. Analysis of earthquake experience data shows damage to heavy industrial facilities, taken as analogs to nuclear plant structures and components, occurs for earthquakes having moment magnitude M larger than 5.1. Probabilistic seismic risk and margins studies show nuclear plant structures and adequately anchored ductile components to be rugged for moderate-size earthquakes with broad design-type spectral shapes. They may, therefore, be considered rugged for small earthquakes. Finally, nonlinear analysis of the damage effectiveness of strong-motion recordings shows that potential damage does not occur for earthquakes smaller than about M5.6. These results support a conservative LBM of M5.0 for application to nuclear power plant PSH assessments. 144 refs., 78 figs., 34 tabs.

2527 (HW–34461) **Preliminary report, KW reactor incident.** McEwen, L.H. Hanford Works, Richland, WA (USA). 17 Jan 1955.

17p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE90002520. Available from NTIS, PC A03/MF A01 - OSTI.

Declassified 20 Jul 1988.

This is a brief report of the KW reactor incident of January 5, 1955. While the report is based on preliminary data, it is believed to be substantially correct concerning the significant aspects of the incident. More detailed studies now under way will no doubt provide some additional and pertinent details. The report is annotated. The notes pertain to certain aspects of the incident not critical for an understanding of the incident itself and also explain some details of reactor construction, equipment, and practices not of general knowledge. 5 figs.

2528 (IAEA-SM–310/63P) **A preliminary modeling and analysis framework for severe accident analysis of high power density research reactors.** Greene, S.R.; Simpson, D.B.; Taleyarkhan, R.P. International Atomic Energy Agency, Vienna (Austria). [1989]. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. (CONF-891027–6: International symposium on research reactor safety, operations and modifications, Chalk River (Canada), 23-27 Oct 1989). Order Number DE90002483. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Recent studies of research and production reactor safety are prompting the need for extended severe accident analysis capabilities for those facilities. High power density research reactors have unique design and safety features, and a program to address severe accident issues in such reactors was recently initiated at the Oak Ridge National Laboratory (ORNL). The phased approach and methodology proposed to address severe accident issues in high power density research reactors are presented, along with some emerging insights from ORNL's severe accident studies for the 85 MWt High Flux Isotope Reactor (HFIR) and the planned 332 MWt Advanced Neutron Source (ANS). The goal of these efforts is to provide a more detailed and credible simulation of severe accident issues for research reactors, such as core melting and relocation, fuel-coolant interactions, and core-concrete interactions, than is possible via application of the current generation of light water reactor (LWR) severe accident analysis codes. 3 refs., 2 tabs.

2529 (INIS-BR–1733) **Environmental protection and safety of nuclear facilities.** Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia. 1977. 149p. (In Portuguese). Order Number DE90608315. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Some papers about environmental effects, safety analysis and radioactive waste management of nuclear power plants are presented.

2530 (INIS-mf–12016) **Critical investigations and model development on countercurrent flow of gas and liquid in horizontal and vertical channels. Final report.** Mewes, D.; Beckmann, H. Hannover Univ. (Germany, F.R.). Inst. fuer Verfahrenstechnik; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). 1989. 50p. (In German). Contract BMFT 1 500 719. Order Number DE90722260. Available from NTIS (US Sales Only), PC A03/MF A01.

Countercurrent flow of steam and water occurs in the horizontal and vertical lines of a PWR in case of a LOCA. In order to predict the emergency core cooling behaviour in case of a large or small break LOCA it is important to calculate the volumetric flow rate of water which will get to the reactor core. Theoretical and experimental results of countercurrent flow in horizontal and vertical channels given by publication and reports are critically reviewed for the purpose of a more physical understanding of the flow phenomena. The influence of geometry, pressure and other boundary conditions are emphasized. The existing models which are developed to calculate the onset of flooding are based on experimental results of small test facilities. The applicability of these models to large geometries and high pressures as well as the consideration of condensation and entrainment are investigated. (orig./HP).

2531 (INIS-mf–12017) **Elastic-plastic fracture mechanics analysis of a pressure vessel with an axial outer surface flaw. Technical report.** Aurich, D. Bundesanstalt fuer Materialforschung und -pruefung, Berlin (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Apr 1989. 59p. (In German). Contract BMFT 1500 490. Order Number DE90722261. Available from NTIS (US Sales Only), PC A04/MF A01.

Elastic-plastic finite element analyses of a test vessel (steel 1.6310=20 MnMoNi 55) with a semi-elliptical axial outer surface crack have been performed. The variations of J and CTOD along the crack front and the stresse state in the vicinity of the crack are presented. The applicability of approaches to determine J is examined. The FE results are compared with the experimental data. The results are analyzed with respect to the validity of J-controlled crack growth. It will be shown that the local ductile crack growth and, especially, the 'canoe effect' for a semi-elliptical crack can only be described correctly if local J_R-curves are used which account for the varying triaxiality of the stress state along the crack front. (orig./HP).

2532 (INIS-mf–12019) **Development of a technique for dismantling geometric complicated and thick components of closed down nuclear power plants with the principle of arc-waterjet cutting. Final report.** Bach, F.W.; Bruening, D. Hannover Univ. (Germany, F.R.). Inst. fuer Werkstoffkunde; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Apr 1989. 92p. (In German). Contract BMFT 02 S 7185. Order Number DE90722431. Available from NTIS (US Sales Only), PC A05/MF A01.

1. Status of research: With arc waterjet cutting it is possible to cut stainless steel up to a wall thickness of 30 mm under water. An application of this technique in 20 m water depth is possible. 2. Aim of research work: A thermal cutting process which is empolyed in a water depth of 20 m is to be developed. Stainless steel up to a wall thickness of 100 mm must be sectile. Cutting of plane parts with variable wall thickness and geometric must be possible. Pipes and pipe assemblies are to be cut from inside or outside. 3. Method of research: A torch was developed which can melt the work piece with a wire electrode. The ignition of cutting will be done with short circuit with a concentrial around the wire out going water jet the liquid metal will be washed away. 4. Results: It is possible to cut stainless steel under water up to a wall thickness of 100 mm. There is no influence to the cutting process in a water depth of 20 m. 5. Suitability: With arc waterjet cutting remote controlled dismantling of thick-walled components of closed down nuclear power plants under water is possible. (orig.) With 35 refs., 6 tabs., 65 figs.

2533 (JAERI-M–89-076) **Study on the behavior of PWR remedy fuel under reactivity initiated accident conditions. Effect of pellet shape modification.** Yanagisawa, Kazuaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 18p. (In Japanese). Order Number DE90719547. Available from NTIS (US Sales Only), PC A03/MF A01.

An influence of pellet shape modification on the failure thresholds of domestic PWR fuel rods under the reactivity initiated accident (RIA) conditions was studied. Experimental parameters used were pellet end shape and its length (L) to diameter (D) ratio. Comparisons were made between fuels with double dishing with a large L/D = 1.65 (standard fuels) and fuels with double dishing and chamfering with a small L/D = 1.22 (remedy fuels). After prepressurization to the ranges from 3.0 to 3.5 MPa, the two were pulse irradiated at NSRR. Major results obtained are: (1) Within this experimental scope, no differences in failure thresholds were existed between the standard fuels and the remedy fuels. The failure thresholds of these fuels were about 150 cal/g fuel (0.63 kJ/g fuel). On the other hand, the failure threshold of past NSRR prepressurized standard fuels shown in the RIA Safety Guide Standard was about 120 cal/g fuel (0.50 kJ/g fuel). Consequently, the tested rods have shown the enough safety margins. (2) The failure mechanisms were cladding rupture induced by ballooning. The mechanisms were the same as observed preveously in the past NSRR experiments with prepressurized standard fuels. (author).

2534 (JAERI-M–89-077) **Review on fission product source term from fuel at severe accident conditions, chemical forms and release rates.** Nakamura, Takehiko; Yanagihara, Satoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 67p. (In Japanese). Order Number DE90719540. Available from NTIS (US Sales Only), PC A04/MF A01.

Fission product source terms at severe accident conditions have been studied vigorously since the accident at TMI unit 2. Among with the effort, some series of out-of-pile experiments have been performed to investigate fission product release behavior, exclusively, from fuel rods at the off-normal conditions. This report reviews the results of two major series of the source term tests, i.e. SASCHA (PNS Project, FRG) and HI-VI test (ORNL, USA). These tests have been the major sources for estimating fission product source terms in the primary cooling system, in the containment and subsequently to the environment at hypothetical Severe Accidents. Findings on the chemical forms of some important fission products in these tests are summarized. A diffusion model is introduced to represent volatile fission product release observed in the ORNL tests. The diffusion model described Kr and Cs releases better than the existing CORSON-M model does. In addition, experimental and analytical techniques used in these tests are also summarized, in order to clarify the reliability and problems of the test data. (author).

2535 (JAERI-M–89-078) **Study on the behavior of waterside corroded PWR fuel rods under reactivity initiated accident conditions.** Sasajima, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 41p. (In Japanese). Order Number DE90719542. Available from NTIS (US Sales Only), PC A03/MF A01.

One of the highlighted problems from the fuel reliability point of view is a waterside corrosion of fuel cladding which becomes more significant at extended burnup stages. To date, at highly burned fuel, waterside corrosion was recognized as important because cladding oxidation increased with increasing burn-up. In experiments, as the basic research for the study of high burn-up fuel, the test fuel rods were prepressurized to ranges from 3.47 to 3.55 MPa, oxidized artificially to both 10 and 20 μm in thickness. Regarding fabricated oxide thickness of 10 μm, it is corresponded to be transition point from cubic law to linear law as a function of burn-up. Pulse irradiation experiments by NSRR were carried out to study the behavior of waterside corroded PWR type fuels under RIA conditions. Obtained results are: (1) The failure threshold of tested fuels was 110 cal/gcenter dotfuel (0.46 KJ/gcenter dotfuel) in enthalpy. This showed that the failure threshold of tested fuels was same as that of the past NSRR experimental data. (2) The failure mechanisms of the tested fuel rods was cladding rupture induced by ballooning. No differences in failure mechanisms existed between the past NSRR prepressurized standard fuel and the tested fuels. (3) Cracks were existed without propagating into cladding matrix, so that it was judged that these were not initiation of failure. (4) Whithin this experimental condition, reduction of cladding thickness being attributed to the increase of oxidation did not failure threshold. (author).

2536 (NUREG–1232-Vol.3-Suppl.1) **Safety evaluation report on Tennessee Valley Authority: Browns Ferry nuclear performance plan: Browns Ferry Unit 2 restart: Volume 3, Supplement 1.** Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation. Oct 1989. 96p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A05/MF A01 - GPO; OSTI; INIS.

This safety evaluation report (SER) on the information submitted by the Tennessee Valley Authority (TVA) in its Nuclear Performance Plan, through Revision 2, for the Browns Ferry Nuclear Plant and in supporting documents has been prepared by the US Nuclear Regulatory commission staff. The Browns Ferry Nuclear Plant consists of three boiling-water reactors at a site in Limestone County, Alabama. The plan addresses the plant-specific concerns requiring resolution before the startup of Unit 2. The staff will inspect implementation of those TVA programs that address these concerns. Where systems are common to Units 1 and 2 or to Units 2 and 3, the staff safety evaluations of those systems are included herein. 85 refs.

2537 (NUREG–1384-Vol.1) **Human Factors Regulatory Research Program Plan, FY 1989–FY 1992: Volume 1.** Coffman, F.; Persensky, J.; Ryan, T.; Ramey-Smith, A.; Goodman, C.; Serig, D.; Trager, E. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research. Oct 1989. 73p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A05/MF A01 - GPO; OSTI; INIS.

This report describes the currently ongoing (FY 1989) and planned (FY 1989-1992) Human Factors Regulatory Research Program in the NRC Office of Nuclear Regulatory Research (RES). Examples of the influence of human factors on nuclear safety are presented, and the role of personnel is discussed. Current regulatory issues associated with human factors in the nuclear system and the purpose of the research plan are provided. The report describes the research process applied to the human factors research issues and the program activities: Personnel Performance Measurement, Personnel Subsystem, Human-System Interface. Organization and Management, and Reliability Assessment. The research being conducted within each activity is summarized along with the objectives, background information, and expected regulatory products. Budget and personnel forecasts are provided along with a summary of contractors performing some of the ongoing research. Appendices contain a chronology of human factors research at NRC, a description of the research approach, an update on human factors programs and initiatives in RES and other NRC offices, and the integration among these programs. 46 refs., 5 tabs.

2538 (NUREG/CP–0102-Vol.1) **NRC regulatory information conference: Proceedings: Volume 1.** Nuclear Regulatory Commission, Washington, DC (USA). Sep 1989. 546p. Sponsored by Nuclear Regulatory Commission. (CONF-8904274–Vol.1: NRC regulatory information conference, Washington, DC (USA), 18-20 Apr 1989). Available from NTIS, PC A23/MF A01 - GPO; OSTI; INIS.

This volume of the report provides the proceedings from the Nuclear Regulatory Commission (NRC) Regulatory Information Conference that was held at the Mayflower Hotel, Washington, DC, on April 18, 19, and 20, 1989. This conference was held by the NRC and chaired by Dr. Thomas E. Mosley, Director, Office of Nuclear Reactor Regulations (NRR) and coordinated by S. Singh Bajwa, Chief, Technical Assistance Management Section, NRR. There were approximately 550 participants from nine countries at the conference. The countries represented were Canada, England, Italy, Japan, Mexico, Spain, Taiwan, Yugoslavia, and the United States. The NRC staff discussed with nuclear industry its regulatory philosophy and approach and the bases on which they have been established. Furthermore, the NRC staff discussed several initiatives that have been implemented recently and their bases as well as NRC's expectations for new initiatives to further improve safety. The figures contained in Appendix A to the volume correspond to the slides that were shown during the presentations. Volume 2 of this report contains the formal papers that were distributed at the beginning of the Regulatory Information Conference and other information about the conference.

2539 (NUREG/CR–2850-Vol.8) **Population dose commitments due to radioactive releases from nuclear power plant sites in 1986.** Baker, D.A. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Computer and Telecommunications Services; Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 163p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (PNL–4221-Vol.8). Available from NTIS, PC A08/MF A01 - GPO; OSTI; INIS.

Population radiation dose commitments have been estimated from reported radionuclide releases from commercial power reactors operating during 1986. Fifty-year dose commitments for a one-year exposure from both liquid and atmospheric releases were calculated for four population groups (infant, child, teen-ager and adult) residing between 2 and 80 km from each of 66 reactor sites. This report tabulates the results of these calculations, showing the dose commitments for both water and airborne pathways for each age group and organ. Also included for each of the sites is a histogram showing the fraction of the total population within 2 to 80 km around each site receiving various average dose commitments from the airborne pathways. The total dose commitments (from both liquid and airborne pathways) for each site ranged from a high of 31 person-rem to a low of 0.0007 person-rem for the sites with plants operating throughout the year with an arithmetic mean of 1.7 person-rem. The total population dose for all sites was estimated at 110 person-rem for the 140 million people considered at risk. The site average individual dose commitment from all pathways ranged from a low of 2×10^{-6} mrem to a high of 0.02 mrem. No attempt

was made in this study to determine the maximum dose commitment received by any one individual from the radionuclides released at any of the sites. 12 refs.

2540 (NUREG/CR–2907-Vol.8) **Radioactive materials released from nuclear power plants: Annual report, 1987.** Tichler, J.; Norden, K.; Congemi, J. Nuclear Regulatory Commission, Washington, DC (USA). Office of Information Resources Management; Brookhaven National Lab., Upton, NY (USA). Oct 1989. 327p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (BNL-NUREG–51581-Vol.8). Available from NTIS, PC A15/MF A01 - GPO; OSTI; INIS.

Releases of radioactive materials in airborne and liquid effluents from commercial light water reactors during 1987 have been compiled and reported. Data on solid waste shipments as well as selected operating information have been included. This report supplements earlier annual reports issued by the former Atomic Energy Commission and the Nuclear Regulatory Commission. The 1987 release data are summarized in tabular form. Data covering specific radionuclides are summarized. 16 tabs.

2541 (NUREG/CR–5215) **A standard problem for HECTR-MAAP [Hydrogen Event: Containment Transient Responses-Modular Accident Analysis Program] comparison: In-cavity oxidation.** Wong, C.C. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (USA). Oct 1989. 102p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (SAND–88-2260). Available from NTIS, PC A06/MF A01 - GPO - OSTI.

To assist in the resolution of differences between the NRC and IDCOR on the hydrogen combustion issue, a standard problem has been defined to compare the results of HECTR and MAAP analyses of hydrogen transport and combustion in a nuclear reactor containment. The first part of this problem, which addresses the question of deflagration in the upper and lower compartments, was presented in NUREG/CR-4993. The second part of this problem has been completed and is discussed in this report. This part addresses the issue of in-cavity oxidation of combustible gases produced by core-concrete interactions and the natural circulation between the reactor cavity and the lower compartment. HECTR analyses of the problem show that it is overly optimistic to assume a complete oxidation in the reactor cavity because a variety of phenomena, such as steam inerting and oxygen transport by natural convection, may influence the degree of in-cavity oxidation that takes place. An incomplete in-cavity oxidation will lead to accumulation and combustion of hydrogen and carbon monoxide in the lower and upper compartments in the reactor containment. This deflagration generates a peak pressure of 384.2 kPa (55.72 psia) at 7.36 hours. 20 refs., 38 figs., 2 tabs.

2542 (NUREG/CR–5225) **An overview of BWR Mark-I containment venting risk implications.** Wagner, K.C.; Dallman, R.J.; Galyean, W.J. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Safety Issue Resolution; EG and G Idaho, Inc., Idaho Falls, ID (USA). Nov 1988. 81p. DOE Contract AC07-76ID01570. (EGG–2548). Available from Q;I 05/MF A01 - OSTI.

Venting of boiling water reactors with Mark-I containments has been suggested as a way to prevent catastrophic failure and/or mitigate the consequences resulting from a severe accident. Based on phenomenological, human factors, and risk considerations, the potential benefits and downsides of venting Mark-I containments were analyzed. Several generic venting systems and two proposed utility systems were reviewed. Based on generic considerations, the offsite consequences during risk dominant accidents were qualitatively assessed for four different vent systems. A quantitative risk study of an early venting strategy was performed, based on the existing Peach Bottom hardware and the draft NUREG-1150 results for Peach Bottom. Appendices are also included which contain reviews of the Pilgrim and Vermont Yankee venting submitals, a response to the seven questions from the NRC about the Pilgrim venting strategy, and a review of the venting strategy directed by Revision 4 of the Boiling Water Reactor Emergency Procedures Guidelines. 16 refs., 7 figs., 7 tabs.

2543 (NUREG/CR–5236) **Radiation-related impacts for nuclear plant physical modifications: Final report.** Sciacca, F.; Knudson, R.; Simion, G.; Baca, G.; Behling, H.; Behling, K.; Britz, W.; Cohen, S. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Regulatory Applications; Science and Engineering Associates, Inc., Albuquerque, NM (USA); Cohen (S.) and Associates, Inc., McLean, VA (USA). Oct 1989. 55p. Sponsored by Nuclear Regulatory Commission. (SEA–87-253-08-A:1). Available from NTIS, PC A04/MF A01 - GPO; OSTI; INIS.

The radiation fields in nuclear power plants present significant obstacles to accomplishing repairs and modifications to many systems and components in these plants. The NRC's generic cost estimating methodology attempts to account for radiation-related impacts by assigning values to the radiation labor productivity factor. This radiation labor productivity factor is then used as a multiplier on the greenfield or new nuclear plant construction labor to adjust for the actual operating plant conditions. The value assigned to the productivity factor is based on the work-site radiation levels. The relationship among ALARA practices, work-place radiation levels, and radiation-related cost impacts previously had not been adequately characterized or verified. The assumptions made concerning the use and application of radiation-reduction measures such as system decontamination and/or the use of temporary shielding can significantly impact estimates of both labor requirements and radiation exposure associated with a particular activity. Overall guidance was needed for analysts as to typical ALARA practices at nuclear power plants and the effects of these practices in reducing work-site dose rates and overall labor requirements. This effort was undertaken to better characterize the physical modification cost and radiological exposure impacts related to the radiation environment of the work place. More specifically, this work sought to define and clarify the quantitative relationships between or among: radiation levels and ALARA practices, such as the use of temporary shielding, decontamination efforts, or the use of robots and remote tools; radiation levels and labor productivity factors; radiation levels, in-field labor hours, and worker radiation exposure; radiation levels and health physics services costs; and radiation levels, labor hours, and anti-contamination clothing and equipment. 48 refs., 4 figs., 4 tabs.

2544 (NUREG/CR–5293) **Closeout of IE Bulletin 86-01: Minimum flow logic problems that could disable residual heat removal pumps: Minimum flow logic problems that could disable residual heat removal pumps.** Foley, W.J.; Dean, R.S.; Hennick, A. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Operational Events Assessment; Parameter, Inc., Elm Grove, WI (USA). Mar 1989. 27p. Available from NTIS, PC A03/MF A01 - GPO - OSTI.

Documentation is provided in this report for the closeout of IE Bulletin 86-01 regarding minimum flow logic problems that could disable residual heat removal (RHR) pumps in General Electric boiling water reactor facilities (GE/BWRs). Closeout is based on the implementation and verification of four (4) required actions by holders of operating licenses and construction permits of GE/BWR power reactors. Evaluation of responses and NRC/Region inspection reports indicates that the bulletin is closed for all of the 39 affected facilities. Background information is supplied in the Introduction and Appendix A of this report.

2545 (NUREG/CR–5294) **Closeout of IE Bulletin 86-02: Static "O" ring differential pressure switches.** Foley, W.J.; Dean, R.S.; Hennick, A. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Operational Assessment; Parameter, Inc., Elm Grove, WI (USA). Oct 1989. 36p. Sponsored by Nuclear Regulatory Commission. (PARAMETER/IE–185). Available from NTIS, PC A03/MF A01 - GPO; OSTI; INIS.

Documentation is provided in this report for the closeout of IE Bulletin 86-02 regarding static "O" ring differential pressure switches Series 102 or 103 supplied by SOR, Incorporated, as electrical equipment important to safety. Closeout is based on the implementation and verification of either one or six actions required by the bulletin for holders of an operating license or a construction permit for a nuclear power plant. All six actions are required when the facility is equipped with the switches of concern in systems subject to limiting conditions for operations in technical specifications. Evaluation of utility responses and NRC/Region inspection reports in

accordance with two criteria indicates that the bulletin is closed for 116 (97%) of the 119 nuclear power facilities to which it was issued for action. Followup items are proposed for the three (3) facilities with open status, for the use of NRC regional inspectors in ensuring successful completion of required and corrective actions. A conclusion based on the utility responses is presented.

2546 (NUREG/CR–5364) **Summary of advanced LMR [Liquid Metal Reactor] evaluations: PRISM [Power Reactor Inherently Safe Module] and SAFR [Sodium Advanced Fast Reactor].** Van Tuyle, G.J.; Slovik, G.C.; Chan, B.C.; Kennett, R.J.; Cheng, H.S.; Kroeger, P.G. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Regulatory Applications; Brookhaven National Lab., Upton, NY (USA). Oct 1989. 120p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (BNL-NUREG–52197). Available from NTIS, PC A07/MF A01 - GPO; OSTI; INIS.

In support of the US Nuclear Regulatory Commission (NRC), Brookhaven National Laboratory (BNL) has performed independent analyses of two advanced Liquid Metal Reactor (LMR) concepts. The designs, sponsored by the US Department of Energy (DOE), the Power Reactor Inherently Safe Module (PRISM) [Berglund, 1987] and the Sodium Advanced Fast Reactor (SAFR) [Baumeister, 1987], were developed primarily by General Electric (GE) and Rockwell International (RI), respectively. Technical support was provided to DOE, RI, and GE, by the Argonne National Laboratory (ANL), particularly with respect to the characteristics of the metal fuels. There are several examples in both PRISM and SAFR where inherent or passive systems provide for a safe response to off-normal conditions. This is in contrast to the engineered safety systems utilized on current US Light Water Reactor (LWR) designs. One important design inherency in the LMRs is the "inherent shutdown", which refers to the tendency of the reactor to transition to a much lower power level whenever temperatures rise significantly. This type of behavior was demonstrated in a series of unscrammed tests at EBR-II [NED, 1986]. The second key design feature is the passive air cooling of the vessel to remove decay heat. These systems, designated RVACS in PRISM and RACS in SAFR, always operate and are believed to be able to prevent core damage in the event that no other means of heat removal is available. 27 refs., 78 figs., 3 tabs.

2547 (NUREG/CR–5395-Vol.4) **Multiloop integral system test (MIST): Test Group 32, SBLOCA [small-break loss-of-coolant accidents] with altered leak and HPI [high-pressure injection] configurations: Final report: Volume 4.** Gloudemans, J.R. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research; Electric Power Research Inst., Palo Alto, CA (USA); Babcock and Wilcox Owners Group, Lynchburg, VA (USA); Babcock and Wilcox Co., Lynchburg, VA (USA). Nuclear Power Div.; Babcock and Wilcox Co., Alliance, OH (USA). Research and Development Div. Jul 1989. 269p. Sponsored by Electric Power Research Institute; Nuclear Regulatory Commission. (EPRI-NP–6480-Vol.4;BAW–2062). Available from NTIS, PC E10/MF E01 - GPO; OSTI; INIS.

This report contains 4 microfiche supplements.

The multiloop integral system test (MIST) is part of a multiphase program started in 1983 to address small-break loss-of-coolant accidents (SBLOCAs) specific to Babcock & Wilcox-designed plants. MIST is sponsored by the US Nuclear Regulatory Commission, and Babcock & Wilcox Owners Group, the Electric Power Research Institute, and Babcock & Wilcox. The unique features of the Babcock & Wilcox design, specifically the hot leg U-bends and steam generators, prevented the use of existing integral system data or existing integral system facilities to address the thermal-hydraulic SBLOCA questions. MIST and two other supporting facilities were specifically designed and constructed for this program, and an existing facility – the once-through integral system (OTIS) – was also used. Data from MIST and the other facilities will be used to benchmark the adequacy of system codes, such as RELAP-5 and TRAC, for predicting abnormal plant transients. 6 refs., 143 figs., 12 tabs.

2548 (NUREG/CR–5395-Vol.6) **Multiloop integral system test (MIST): Test Group 34, Steam generator tube rupture: Final report: Volume 6.** Gloudemans, J.R. Nuclear Power Div.; Babcock and Wilcox Co., Alliance, OH (USA). Research and Development Div. Jul 1989. 340p. Sponsored by Electric Power Research Institute; Nuclear Regulatory Commission. (EPRI-NP–6480-Vol.6;BAW–2065). Available from NTIS, PC E13/MF E02 - GPO; OSTI; INIS.

This report contains 5 microfiche supplements.

The multiloop integral system test (MIST) is part of a multiphase program started in 1983 to address small-break loss-of-coolant accidents (SBLOCAs) specific to Babcock and Wilcox designed plants. MIST is sponsored by the US Nuclear Regulatory Commission, the Babcock & Wilcox Owners Group, the Electric Power Research Institute, and Babcock and Wilcox. The unique features of the Babcock and Wilcox design, specifically the hot leg U-bends and steam generators, prevented the use of existing integral system data or existing integral facilities to address the thermal-hydraulic SBLOCA questions. MIST and two other supporting facilities were specifically designed and constructed for this program, and an existing facility–the Once Through Integral System (OTIS)–was also used. Data from MIST and the other facilities will be used to benchmark the adequacy of system codes, such as RELAP5 and TRAC, for predicting abnormal plant transients. The MIST program is reported in 11 volumes. The program is summarized in Volume 1; Volumes 2 through 8 describes groups of tests by test type; Volume 9 presents inter-group comparisons; Volume 10 provides comparisons between the calculations of RELAP5/MOD2 and MIST observations, and Volume 11 presents the later Phase 4 tests. This Volume 6 pertains to Test Group 34, Steam Generator Tube Rupture. The specifications, conduct, observations, and results of these tests are described. 6 refs., 189 figs., 16 tabs.

2549 (NUREG/CR–5395-Vol.7) **Multiloop integral system test (MIST): Test Group 35, Noncondensibles and venting: Final report: Volume 7.** Gloudemans, J.R. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research; Electric Power Research Inst., Palo Alto, CA (USA); Babcock and Wilcox Owners Group, Lynchburg, VA (USA); Babcock and Wilcox Co., Lynchburg, VA (USA). Nuclear Power Div.; Babcock and Wilcox Co., Alliance, OH (USA). Research and Development Div. Jul 1989. 353p. Sponsored by Electric Power Research Institute; Nuclear Regulatory Commission. (EPRI-NP–6480-Vol.7;BAW–2066). Available from NTIS, PC E13/MF E01 - GPO; OSTI; INIS.

This report contains 4 microfiche supplements.

The multiloop integral system test (MIST) was a scaled 2-by-4 (2 hot legs and 4 cold legs) physical model of a Babcock & Wilcox (B & W), lowered-loop, nuclear steam supply system (NSSS). MIST was designed to operate at typical plant pressures and temperatures. Experimental data obtained from this facility during post-small-break loss-of-coolant accident (SBLOCA) testing are used for computer code benchmarking. The MIST interactions are of intrinsic interest because they may provide insight into expected plant behavior. MIST was necessarily atypical of a plant in certain important respects, however. The MIST interactions therefore are not to be applied directly to a plant. 5 refs., 239 figs., 11 tabs.

2550 (NUREG/CR–5395-Vol.8) **Multiloop integral system test (MIST): Test Group 36, Pump operation: Final report: Volume 8.** Gloudemans, J.R. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Systems Research; Electric Power Research Inst., Palo Alto, CA (USA); Babcock and Wilcox Owners Group, Lynchburg, VA (USA); Babcock and Wilcox Co., Lynchburg, VA (USA). Nuclear Power Div.; Babcock and Wilcox Co., Alliance, OH (USA). Research and Development Div. Jul 1989. 485p. Sponsored by Nuclear Regulatory Commission. (EPRI-NP–6480-Vol.8;BAW–2016). Available from NTIS, PC E15/MF E02 - GPO; OSTI; INIS.

The multiloop integral system test (MIST) was part of a multiphase program started in 1983 to address small-break loss-of-coolant accidents (SBLOCAs) specific to Babcock & Wilcox-designed plants. MIST was sponsored by the US Nuclear Regulatory Commission, the Babcock & Wilcox Owners Group, the Electric Power Research Institute, and Babcock & Wilcox. The unique features of the Babcock & Wilcox design, specifically the hot leg U-bends and steam generators, prevented the use of existing integral system data or

existing integral system facilities to address the thermal-hydraulic SBLOCA questions. MIST and two other supporting facilities were specifically designed and constructed for this program, and an existing facility – the once-through integral system (OTIS) – was also used. Data from MIST and the other facilities will be used to benchmark the adequacy of system codes, such as RELAP-5 and TRAC, for predicting abnormal plant transients. 7 refs., 321 figs., 14 tabs.

2551 (NUREG/IA–0028) **Review of LOFT [Loss-of-Fluid Test] large break experiments: OECD LOFT project.** Modro, S.M.; Aksan, S.N.; Berta, V.T.; Wahba, A.B. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. (Austria); Paul Scherrer Inst. (PSI), Wuerenlingen (Switzerland); EG and G Idaho, Inc., Idaho Falls, ID (USA); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Garching (Germany, F.R.). Oct 1989. 152p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A08/MF A01 - GPO; OSTI; INIS.

Six non-nuclear and five nuclear large break loss-of-coolant experiments were performed in the Loss-of-Fluid Test (LOFT) PWR facility at the Idaho National Engineering Laboratory. These experiments provided a large amount of data necessary for evaluation and refinement of reactor system computer codes and had major impact on the understanding of large break loss-of-coolant accidents. An overview of these nuclear large break experiments performed under NRC and OECD LOFT programs is given and the major research results are presented. 55 refs., 89 figs., 5 tabs.

2552 (NUREG/IA–0029) **Assessment of RELAP5/MOD2, Cycle 36.04 against FIX-II split break experiment No. 3051.** Eriksson, J. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Swedish Nuclear Power Inspectorate, Nykoeping (Sweden). Oct 1989. 78p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A05/MF A01 - GPO; OSTI; INIS.

The FIX-II split break experiment No. 3051 has been analyzed using the RELAP5/MOD2 code. The code version used, Cycle 36.04, is the frozen version of the code. Three calculations were carried out to study the sensitivity of various parameters to the change of break discharge and passive heat structures. The differences between the calculations and the experiment have been quantified over intervals in real time for a number of variables available from the measurements during the experiment. 8 figs., 8 tabs.

2553 (ORNL/FTR–3437) **[Integrity of pressure components of nuclear power plants]: Foreign trip report, October 3, 1989–October 20, 1989.** Merkle, J.G. Oak Ridge National Lab., TN (USA). 3 Nov 1989. 56p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. Order Number DE90002654. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The traveler attended the 15th annual MPA Seminar at the University of Stuttgart and the European Symposium on Elastic-Plastic Fracture Mechanics (EPFM) at Freiburg, FRG. Following the symposium the traveler made visits to the IWM Laboratory in Freiburg, FRG, the GKSS Research Center in Geesthacht, FRG, the Welding Institute in Cambridge, UK, and the Structural Integrity Centre at Risley, Warrington, UK. Principal subjects of discussion during the laboratory visits were the measurement of fracture toughness in the upper transition temperature range and the possibility of cooperative analytical and experimental efforts concerning the effects of biaxial stresses on fracture toughness for finite length surface cracks in plates and pressure vessel cylinders.

Report for January 1974-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 74p. Available from NTISPC N01/MF N01.

Supersedes PB–89-851133.

This bibliography contains citations concerning studies and measurements of the radiological consequences of nuclear reactor accidents. The citations cover specifically the Chernobyl reactor in the USSR, the Three Mile Island (TMI) reactor in the US, and the Windscale reactor in the UK. Included are detection and monitoring of the fallout, the resultant runoff into rivers, lakes, the sea, the radiation effects on people, and the transfrontier radio ative contamination of the environment. (This updated bibliography contains 164 citations, 59 of which are new entries to the previous edition.)

2555 (SIEMENS-KWU-U9–414/88/022) **Experimental analysis of the behavior of iodine in the event of hypothetical accidents - iodine partition coefficients (follow-on project). Final report.** Bleier, A.; Greger, G.U.; Gropp, C. Siemens A.G. Unternehmensbereich KWU, Erlangen (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Nov 1988. 60p. (In German). Contract BMFT 1500 709/A2. Order Number DE90722092. Available from NTIS (US Sales Only), PC A04/MF A01.

In the event of a severe reactor accident involving core meltdown, sumps containing fission iodine can form in the annulus and in the auxiliary building of a PWR. Iodine revolatilization from these sumps has to be considered. The report contains results of clean conditions tests performed to determine relevant I_2 partition coefficients. In the case of I_2 input only, the I_2 partition coefficient rises from initially 7000 to 250000 within 2-3 hours whereas it rises for I_2/I^- input from 300 up to 57000 in about the same time. These findings were used in the concluding discussion of results from previous iodine revolatilization experiments. It appears as if high values of the partition coefficient under clean conditions cannot be achieved when there is realistic contact of the sump with organically coated surfaces. (orig.) With 17 refs., 11 tabs., 6 figs.

2556 **A new initiative on radiation coordination in the federal government.** Young, A.L. (Office of Science and Technology Policy, Executive Office of the President, Washington, DC (US)); Dix, G.P. vp. of Proceedings of the American Nuclear Society executive conference on good radiation protection management. American Nuclear Society, La Grange Park, IL (1985). (CONF-841223–: ANS executive conference on dollars and sense in good radiation protection management, San Diego, CA (USA), 9-12 Dec 1984).

The Committee on Interagency Radiation Research and Policy Coordination (CIRRPC) is comprised of members of the 15 federal agencies involved in radiation. This paper describes CIRRPC–its goals, its progress, some of the national radiation issues, and observations in starting up. Based upon the wreckage of past initiatives in this area over the last 15 years, since the demise of the Federal Radiation Council in 1970, there was some initial skepticism that CIRRPC could survive or succeed in its goals. However, the members and staff of CIRRPC are dedicated to its success.

2557 **Radiological dose calculations for the chamber and diode region of the light ion fusion target development facility.** Yasar, O. (Fusion Technology Institute, Univ. of Wisconsin-Madison, 1500 Johnson Drive, Madison, WI (USA)); Sawan, M.E.; Henderson, D.L.; Moses, G.A. vp of Proceedings of the 12th symposium on fusion engineering. IEEE Service Center, Piscataway, NJ (1987). (CONF-871007–: 12. symposium on fusion engineering, Monterey, CA (USA), 12-16 Oct 1987).

Biological dose rate calculations are performed for two preliminary designs of the Light Ion Fusion Target Development Facility (TDF) for times following an operational period of one month. The primary wall material considered is aluminum Al-6061-T6 with an alternative material being 2-1/4 Cr-1 Mo steel. The diode material considered is SS304LN stainless steel and the penetration in the chamber wall is 10 cm in radius. As an alternative to the base case 3 m radius chamber design, a 1 m radius chamber is analyzed with various shield materials - borated water, concrete and graphite between the chamber wall and the diode. The dose rate behind the Al first wall for the 3 m chamber design is 34.5 mrem/hr at 1 week after shutdown. For the 1 m chamber design this number is 8.4 rem/hr with an aluminum first wall, and 5 rem/hr with a steel first wall. For the diode region calculations, the first wall is taken as Al-6061-T6 for both the 1 m and 3 m cases. The dose rate at the point external to the diode vacuum casing, one week after shutdown, is 24 mrem/hr for the 3 m case. For the 1 m case, the dose rates at one week after shutdown are 3.7, 3.8 and 5.8 mrem/hr with shield materials of borated water, concrete and graphite, respectively.

2558 **Success/simplicity/safety/savings: SI/trip reduction at Indian point 2.** Ginsberg, A.P.; Mooney, J.; Brandstaedter, M.; Misilo, S.; Speyer, D.M.; Gasperini, J.; Ament, G. *Transactions of the American Nuclear Society (USA),* 57: 171-172 (1988). (CONF-881011–: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

In the 1980s, Consolidated Edison embarked on a unique, ambitious program of safety injection (SI)/trip reduction for its Indian Point Unit 2, four-loop Westinghouse 2758-MW (thermal), pressurized water reactor. The program had the following criteria: 1. Each SI/trip reduction modification should successfully eliminate a majority of unnecessary SI/trips of a specific type. 2. The hardware changes must be simple, having a minimum effect on operations, testing, and maintenance, and be cost-effective. 3. The modifications must retain a significant degree of safety margin, and where possible, be done under 10CFR50.59. Four specific SI/trip classes have been addressed. They are loss-of-feedwater trips, direct reactor trips on turbine generator trips, spurious SI/trips involving high steam flow, and trips following transients resulting from turbine runbacks. Significant results of the program, which involved new solutions to common industry problems, are described. The modifications involved simple schemes and were easily installed at a reasonable cost. Most were done with only one technical specification change required. Based on recent operational data and past trip experience, it is estimated that two to three reactor trips and/or SIs will be avoided per year.

2559 **Maanshan T_pS_LB accident analysis.** Chen, C.C.; Wang, T.K.; Hsueh, J.K. *Transactions of the American Nuclear Society (USA),* 57: 174-176 (1988). (CONF-881011–: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

An T_pS_LB accident analysis for Taipower's Maanshan Unit 1 plant is reported. The plant is a 2775-MW(thermal) pressurized water reactor with large dry containment. Based on Maanhshan level-1 probabilistic risk assessment, the T_pS_LB sequence ranks first in accident frequency. The basic definition of T_pS_LB includes loss-of-off-site power T_p, station blackout, loss of all alternating current power B, and the occurrence of a loss-of-coolant accident (LOCA) due to main coolant pump seal failure, i.e., seal LOCA S_L. The results of a base case study are summarized first. These results are then compared with other studies by varying some key parameter values. All calculations were done with MAAP 3.0 computer code. In the base case study, seal LOCA was assumed to occur 3 h after the initiation of the vent. The LOCA break area was assumed to be 0.169×10^{-3} m^2. Leakage occurred in all three loops. Containment (CTMT) failure pressure was set at 120 psig. The containment break area was set at 0.003 m^2, attempting to keep the pressure roughly constant after containment failure. In the station blackout situation, the direct current power in the Maanshan plant would last 2 h. Accordingly, in the calculations we assumed the turbine-driven auxiliary feedwater and the power-operated relief valves would also be working for 2 h. The major event sequences, including times of core uncovery, vessel failure, and containment failure as well as the resulting fission product release fractions at different time spans after containment failure, are listed. Also listed are the results of other studies.

25 ENERGY STORAGE

2504 Capacitor Banks

2560 (AD-A–210366/1/XAB) **Capacitive energy storage at cryogenic temperatures. Phase 2. Final report, 1 January 1986-31 December 1988.** Clark, C.F. CeramPhysics, Inc., Westerville, OH (USA). 12 Feb 1989. 148p. Available from NTIS, PC A07/MF A01.

The primary goal of this Phase II program was to improve the dielectric breakdown strength of ceramic multilayer capacitors (MLC's) in order to improve capacitive energy storage at liquid-nitrogen temperatures. A secondary goal was to explore the reproducibility of a field-enforced state-switching effect discovered in the Phase I program. The ceramic composition involved in these programs is designated as CPN17 and has a dielectric constant in the range 8,000-10,000 at 77 K. Several variations in conventional ceramic-processing parameters were studied, leading to systematic improvements in the breakdown strength at 77 K (160 to 250 to 400 kV/cm).

2505 Flywheels

2561 (NEI-DK–224) **Electromagnetic flywheel energy storage for use in electric powered trucks and vehicles for domestic transport.** Nissen, O.S. Laboratoriet for Energiforskning, Odense (Denmark). Jan 1987. 61p. (In Danish). Order Number DE90719259. Available from NTIS (US Sales Only), PC A04/MF A01.

EFP-85.

The aim was to develope a small lightweight electromagnetic motor/generator flywheel-buffer energy storage component that is an integrated and sealed unit without gearage components to be utilized in electric-powered vehicles used for domestic transport. The buffer storage is used during acceleration and regenerative braking and should prevent overloading of the batteries. In this way the flywheel energy storage effect will enable the gathering and returning of regenerative braking energy. This will mean that the vehicle's needs in relation to battery capacity can be reduced. In this system it is the flywheel that is the true energy storge facility. The motor/generator, converter and control unit will thus function only as transmission, steering and monitoring systems. (AB).

2562 (RISO-M–2803) **Flywheel for vehicles.** Waagepetersen, G. Risoe National Lab., Roskilde (Denmark). Jun 1989. 55p. (In Danish). Order Number DE90718933. Available from NTIS (US Sales Only), PC A04/MF A01.

EFP-86.

A new type of flywheel is designed to use the brake effect of a vehicle to subsequent start and accelleration. The best existing flywheels for busses have rim and hub made of fiber reinforced composite with an adhesive joint to a steel shaft with a relative little diameter. Hub and adhesive are influenced by big forces among others from gyro moments. The stress situation is complicated, and it has been necessary to have 4 hubs and totally 8 adhesive joints. The new flywheel has no hub but transmit these forces simple and directly as shear, tension and compression to a supporting structure of light metal. There is only one adhesive joint placed at a rather big diameter, where the shear stresses are small as they are reduced with a factor 0.16. This design is much stronger than a hub for all actual forces, and therefore the wheel can run with higher revolutions. As the mass distribution is also better, it means that the wheel with unaltered weight and volume can store about 100% more energy and give 200% bigger effect. In case of a traffic accident the new wheel can stand 100 g in all directions. (author).

2563 (DOE/CE/15449–T1) **Fuel savings in the heavy trucking industry through cool storage: Technical progress report, June 20–September 19, 1989.** Instatherm Co., Cary, NC (USA). [1989]. 4p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG01-89CE15449. Order Number DE90001469. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Complete the development and bench testing of a full size engineering prototype for the system and initiate the in-vehicle testing of the unit. Three of the four modules, that make-up the engineering prototype, were completed prior to the start of this DOE program. The fourth module required repackaging, because of inadequate insulation and this was accomplished. 2 figs.

2564 (EPRI-CU–6561-Vol.1) **Operation and performance of commercial cool storage systems: Volume 1, 1987 cooling season.** Merten, G.P.; Shum, S.L.; Sterrett, R.H.; Racine, W.C. Electric Power Research Inst., Palo Alto, CA (USA); Science Applications International Corp., San Diego, CA (USA). c Sep 1989. 171p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The performance of six cool storage installations was monitored and analyzed with participating electric utilities, under the Electric Power Research Institute (EPRI) Commercial Cool Storage Field Performance Monitoring Project (RP 2732-05). The objective of this project is to provide information on the performance of cool storage systems to improve the system design and operation, and thereby the economics of such systems. In this report the cool storage system performance and impact of cool storage on the site electric demand and energy use is discussed. The performance of chilled water, electric salt, and ice storage systems is compared to each other and to the performance of non-storage, conventional air conditioning systems. Recommendations to improve system performance are made and fall into three areas: (1) integration of the cool storage system and building HVAC system, (2) system maintenance, and (3) storage tank design and operation. 2 refs., 14 figs., 4 tabs.

2565 (EPRI-CU-6561-Vol.2) **Operation and performance of commercial cool storage systems: Volume 2, 1988 cooling season and project summary.** Merten, G.P.; Shum, S.L.; Sterrett, R.H.; Racine, W.C. Electric Power Research Inst., Palo Alto, CA (USA); Science Applications International Corp., San Diego, CA (USA). c Sep 1989. 137p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

EPRI initiated the Commercial Cool Storage Field Performance Monitoring Project (RP2732-05) to provide cool storage system performance data for use in improving system design, operation and economics. In cooperation with twelve participating utilities, cool storage systems were monitored and analyzed at six commercial buildings in 1987 and at seven buildings in 1988. This final report discusses the impacts of monitored cool storage systems on site electric demand and energy use patterns. The chiller and auxiliary equipment energy consumption and storage tank thermal performance are discussed for chilled water, eutectic salt and ice storage systems. A conventional air conditioning system is simulated for each site and its performance is compared with the cool storage system's monitored performance. Recommendations are made to utilities and system designers to help their customers improve system performance and operation. 3 refs., 10 figs., 5 tabs.

2566 (PB-89-871628/XAB) **Thermal energy storage. July 1987-September 1989 (Citations from the NTIS data base). Report for July 1987-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 120p. Available from NTISPC N01/MF N01.

Supersedes PB-88-868831.

This bibliography contains citations concerning thermal energy storage in reservoirs, aquifers, rock beds, molten salts, and manufactured storage devices, such as Trombe walls, direct gain cells, and phase-change materials for solar heating and spacecraft. The citations cover the design, evaluation, theory, and materials used. Some citations report on effects of using certain storage media, such as aquifers. (This updated bibliography contains 217 citations, 88 of which are new entries to the previous edition.)

2509 Batteries

2567 (AD-A-210755/5/XAB) **Lithium-polymer-electrolyte battery: Electrochemical behavior of cathode materials. Technical report, July 1988-June 1989.** Scrosati, B.; Selvaggi, B.; Owens, B.B.; Munshi, M.Z. Minnesota Univ., Minneapolis, MN (USA). Corrosion Research Center. 15 Jun 1989. 3p. (TR-2). Available from NTIS, PC A02/MF A01.

Thin-layer, lithium-polymer-electrolyte batteries have reached an advanced stage of development. All prototypes use insertion compounds of various composition and structures as the active cathode material. Titanium disulfide, vanadium oxide and lithium vanadium bronze, respectively, were tested under comparable conditions as the active electrode materials. The characteristics of the interfaces were examined by cyclic voltammetry, impedance spectroscopy, and intercalation-deintercalation cycling and the results of this study are reported in this work.

2568 (AD-A-210786/0/XAB) **Cell performance of ultra-thin polymer-cathode system: Theoretical energy and power-density projections. Technical report No. 3, July 1988-June 1989.** Naoi, K.; Owens, B.B.; Smyrl, W.H. Minnesota Univ., Minneapolis, MN (USA). Corrosion Research Center. 15 Jun 1989. 3p. Available from NTIS, PC A02/MF A01.

Theoretical energy and power-density values for thin film lithium/liquid electrolyte/polymer cell systems were calculated by designing a specific cell model for both a prismatic cell with only the basic cell elements (no hardware) and a bipolar-design cell with some idealized practical hardware. The cell performance is compared for three different cathode-polymer materials, viz., polyaniline, polypyrrole, and polyvinylferrocene. The energy and power densities are estimated as a function of cathode thickness, active cell area, and initial concentration of electrolyte for very thin cathode films (cathode thickness: Lc=1 to 100 micrometer in both single-cell and bipolar designs). The energy and the power are estimated at 80 Wh/kg and 800 kW/kg for 10 micrometer cathodes. Problems of the battery manufacturing process were not addressed.

2569 (AD-A-210789/4/XAB) **Use of lithium batteries in biomedical devices. Technical report No. 8, July 1988-June 1989.** Owens, B.B. Minnesota Univ., Minneapolis, MN (USA). Corrosion Research Center. 15 Jun 1989. 4p. Available from NTIS, PC A02/MF A01.

Lithium batteries have played an important role in the development of useful implantable biomedical devices. The cardiac pacemaker is the most well known of these devices and high-energy, long-life reliable lithium primary cells have effectively replaced all of the alkaline cells previously used in these electronic systems. The recent development of higher-power devices such as drug pumps and cardiac defibrillators require the use of batteries with higher energy and power capabilities. High rate rechargeable batteries that can be configured as flat prismatic cells would be especially useful in some of these new applications. Lithium polymer electrolyte-batteries may find a useful role in these new areas.

2570 (AD-A-210978/3/XAB) **Rechargeable lithium/polymer cathode batteries. Technical report, July 1988-June 1989.** Osaka, T.; Nakajima, T.; Shiota, K.; Owens, B.B. Minnesota Univ., Minneapolis, MN (USA). Dept. of Chemical Engineering and Materials Science. 15 Jun 1989. 4p. (TR-6-ONR). Available from NTIS, PC A02/MF A01.

Polypyrrole (PPy) and polyaniline (PAn) were investigated for cathode materials of rechargeable lithium batteries. PPy films prepared with PF6(-) anion and/or Platinum substrate precoated with nitrile butadiene rubber(NBR) were excellent cathode materials because of rough and/or highly oriented film structure. PAn films were successfully prepared from non-aqueous propylene carbonate solution containing aniline, CF_3COOH and lithium perchlorate. Its acidity strongly affects the anion doping-undoping behavior. The Pan cathode prepared in high acidic solution (e.g. 4:1 ratio of acid:aniline) gives the excellent battery performance.

2571 (AD-A-210979/1/XAB) **Impedance analysis of ionic transport in polypyrrole-polyazulene copolymer and its charge-discharge characteristics. Technical report, July 1988-June 1989.** Naoi, K.; Ueyama, K.I.; Osaka, T.; Smyrl, W.H. Minnesota Univ., Minneapolis, MN (USA). Dept. of Chemical Engineering and Materials Science. 15 Jun 1989. 27p. (TR-7-ONR). Available from NTIS, PC A03/MF A01.

Ionic-transport behavior across an electropolymerized polypyrrole/polyazulene composite film was investigated by using ac impedance analysis, and its charge-discharge characteristics were also studied. Co-electropolymerization of pyrrole and azulene was well defined and fairly stoichiometric in propylene carbonate solution. The charge capacity for the composite films showed a remarkable increase for films around 50 to 75% of azulene monomer content, and the behavior was correlated with morphological and diffusivity changes. The charge-discharge characteristics were examined for cells with a lithium anode and various polypyrrole/polyazulene composite cathodes. Pure polypyrrole cathodes behaved exactly like a capacitor at low frequency, while pure polyazulene cathodes showed excellent rechargeable behavior with very flat discharge curves. Composite cathodes showed intermediate behavior.

2572 (AD-A-211254/8/XAB) **Battery actuation of NITINOL at sub-zero temperatures.** Goldstein, D. Naval Surface Warfare Center, Silver Spring, MD (USA). Apr 1989. 22p. (NSWC-TR-89-110). Available from NTIS, PC A03/MF A01.

It is feasible to use batteries to produce rapid shape-memory response in NITINOL wires in sub-zero temperature ambients. Data are presented on lithium thionyl chloride batteries used to joule heat 10-mil-diameter wires of nominal transformation temperatures of 90-105 C. The batteries and wires were jointly tested in a -35C ambient air environment. The wire contracted 5% in length (0.4 inch) and lifted a 1 pound load in 1/2 second.

2573 (CONF-891132-7) **Sodium/sulfur post-test analysis at ANL.** Smaga, J.A. Argonne National Lab., IL (USA). [1989]. 6p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From 9. battery and electrochemical contractors' conference; Alexandria, VA (USA); 13-17 Nov 1989. Order Number DE90001911. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

One activity of Argonne's Analysis and Diagnostics Laboratory has been the examination of selected sodium/sulfur cells that were built and tested by Chloride Silent Power Ltd. (CSPL) as part of the Exploratory Battery Technology Development Program at Sandia National Laboratories. The more recent examinations have involved long-lived (>400 cycles) cells of both basic cell designs (PB and XPB). The examined cells can be further differentiated according to the different designs used for the seal assembly and the sodium electrode. The detailed examinations conducted with the specialized facilities maintained at ANL have led to some significant findings stemming from these design variations. Some of the results for case corrosion, electrolyte contamination, and seal degradation are presented, and the effect of the design changes on these conditions is discussed. 3 figs.

2574 (CONF-891132-8) **Status and results of ANL life evaluation of valve-regulated lead-acid load-leveling batteries.** DeLuca, W.H.; Miller, J.F.; Webster, C.E.; Hogrefe, R.L. Argonne National Lab., IL (USA). [1989]. 6p. Sponsored by Electric Power Research Institute; International Lead Zinc Research Organization (ILZRO). DOE Contract W-31109-ENG-38. From 9. battery and electrochemical contractors' conference; Alexandria, VA (USA); 13-17 Nov 1989. Order Number DE90001918. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Argonne National Laboratory has developed and initiated a three-year life evaluation of both gelled-electrolyte and absorbed-electrolyte valve-regulated lead-acid (VRLA) battery technologies for deep-discharge applications. The objectives are (1) to use accelerated testing techniques to obtain data within 6 months on VRLA battery life expectancy, and (2) to determine VRLA battery life within a 2-3 year time period under temperature and depth-of-discharge (DOD) conditions that simulate those encountered in a utility load-leveling environment. The accelerated life test uses a matrix of operating conditions designed to increase the stress of known failure modes, thereby accelerating the mechanisms that cause battery end-of-life. The primary failure mode is expected to be active material changes caused by charge-discharge cycling (i.e., microstructural and morphological changes, sulfation, mass isolation, loss of surface area, loss of porosity, etc). The test matrix consists of four sets of operating conditions (80% and 100% DOD and 30°C and 50°C temperature), which include the stress factors to accelerate failure.

2575 (CONF-8905126-7) **Calorimetric measurements on electrochemical cells with Pd-D cathodes.** Redey, L.; Myles, K.M.; Dees, D.; Krumpelt, M.; Vissers, D.R. Argonne National Lab., IL (USA). [1989]. 27p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Workshop on cold fusion phenomena; Santa Fe, NM (USA); 23-25 May 1989. Order Number DE90002198. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Two series of experiments were performed to determine the conditions of cell operation that produce sufficient heat to be useful for the production of energy. In the first series, the results from a differential temperature analysis of identical light- and heavy-water electrochemical cells were too ambiguous and, thus not suitable for evaluating excess heat effects. In the second series, two Pd-D/LiOD-saturated D_2O/Pt cells were operated at current densities between 15 and 500 mA/cm^2 in a constant-heat-loss-rate twin calorimeter for 460 hours. Water loss measurements during the experiments indicated that the recombination reaction ($D_2 + O_2 \rightarrow D_2O$) did not occur. The D/Pd ratio was determined gravimetrically during the experiments. No excess heat was found within the sensitivity (0.13 W, 0.082 W/cm^3 of Pd, 0.013 W/cm^2 of Pd) and precision (±0.3 W) of the calorimeter. 11 refs., 11 figs.

2576 (DOE/ID-10243) **Assessment of battery technologies for electric vehicles: Volume 1.** Ratner, E.Z.; Symons, P.C.; Walsh, W.; Warde, C.J.; Henriksen, G.L. (eds.). EG and G Idaho, Inc., Idaho Falls, ID (USA). Aug 1989. 63p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE90002049. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

To help guide future EV battery R&D programs, the US Department of Energy (DOE) commissioned a comprehensive assessment of viable secondary battery technologies. A total of 55 battery developers – from the United States, Canada, Europe, Asia, and Africa – were solicited to submit battery design concepts for an "Improved Dual-Shaft Electric Propulsion" (IDSEP) van. A team of 7 representatives from DOE laboratories and 10 independent EV and Battery consultants evaluated 42 design concepts. Using six criteria – five technical/economic criteria and a maturity/technical barriers criterion – the Assessment Team identified 12 most-promising batteries. 11 refs., 5 figs., 16 tabs.

2577 (EGG-M-88115) **A simplified battery discharge profile based upon the federal urban driving schedule.** Cole, G.H. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1988. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. (CONF-881162-4: 9. electric vehicle symposium, Toronto (Canada), 13-16 Nov 1988). Order Number DE90002016. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A battery discharge test consisting of twenty steps of five constant power levels was developed by the US Department of Energy sponsored Battery Test Working Task Force. The results of this battery test closely approximate the results obtained from a battery discharge in the hypothetical improved Dual-Shaft Electric Propulsion (IDSEP) van over the Federal Urban Driving Schedule. This battery test (known as the SFUDS79) is described and the results of terminating the discharge at a minimum battery voltage for various batteries are presented and compared to a FUDS discharge. A test termination criteria based upon power limits that would predict the vehicle range over the SAE J227 FUDS test procedure is given and a method of scaling the specific power vs time profile of the test cycle for EV batteries is proposed. The effect of rest periods between discharge cycles from experimental data is also presented. 3 refs., 7 figs., 3 tabs.

2578 (LBL-27037) **Technology Base Research Project for electrochemical energy storage: Annual report for 1988.** Kinoshita, Kim (ed.). Lawrence Berkeley Lab., CA (USA). May 1989. 28p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002604. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report summarizes the progress made by the Technology Base Research (TBR) Project for Electrochemical Energy Storage during calendar year 1988. The primary objective of the TBR Project, which is sponsered by the Department of Energy (DOE) and managed by Lawrence Berkeley Laboratory (LBL), is to identify electrochemical technologies that can satisfy stringent performance and economic requirements for electric vehicles and stationary energy storage applications. The ultimate goal is to transfer the most-promising electrochemical technologies to the private sector or to another DOE project (e.g., SNL's ETD Project) for further development and scale-up.

2579 (LBL-27466) **The secondary slurry-zinc/air battery: Final report.** Sierra Alcazar, H.B.; Nguyen, P.D.; Mason, G.E.; Pinoli, A.A. Lawrence Berkeley Lab., CA (USA); Pinnacle Research Inst., Cupertino, CA (USA). Jul 1989. 47p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002600. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The rechargeability of the slurry-Zn/air battery was demonstrated with a practical recharge cell that requires minimal hydraulic and mechanical energy for operation. A dendritic Zn was deposited on a Mg plate substrate from which it was easily, periodically and automatically scraped to regenerate dendritic Zn slurries. Excellent discharge results were obtained with the regenerated dendritic Zn slurry, comparable to those obtained with slurries made with mixtures of Zn powder. The dendritic Zn slurry allowed, however, twice the utilization of Zn. 13 refs., 24 figs., 2 tabs.

2580 (PB–89-870646/XAB) **Lithium batteries. October 1987-September 1989 (Citations from the COMPENDEX data base). Report for October 1987-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 118p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869136.

This bibliography contains citations concerning the design, development, and applications of lithium batteries. Topics include electrochemical aspects, cycling characteristics, performance evaluations, and applications in cardiac pacemaker devices. Batteries utilizing organic compounds, chlorides, and metal sulfides are discussed. (This updated bibliography contains 240 citations, 100 of which are new entries to the previous edition.)

2581 (UCRL–21229) **High-power-density prime power systems: A literature search and analysis.** Hamby, D.C. Lawrence Livermore National Lab., CA (USA); Linfield Coll., McMinnville, OR (USA). Research Inst. 1 Jun 1989. 111p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. Order Number DE90002527. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The electrical characteristics of the loads to be faced by the power source are given. Two loads are inductive-resistive; one to be brought to a specified flux in the inductor and one to be brought to a specified energy in the inductor within stated time limits which are of the order of milliseconds. The third load is capacitive-resistive and the capacitor is to be brought to a specified voltage in a period of seconds. Charge (a few Coulombs) and energy (about 10^5 Joules) requirements of the loads are modest compared to the capabilities of common automotive batteries; however, the average power demands of the loads are high (25 to 50 MW or higher for the inductive-resistive loads). Source voltages required to drive the specified loads are much larger than those of common batteries. The literature indicates that the way to achieve the required voltages at high power density and specific power is to utilize thin cell bipolar batteries, a bipolar design offers potential advantages of low cell resistance and weight, and uniformity of electrode current density. 123 refs., 31 figs., 3 tabs.

2582 **Laboratory evaluation of advanced battery technologies for electric vehicle applications.** DeLuca, W.H.; Kulaga, J.E.; Hogrefe, R.L.; Tummillo, A.F.; Webster, C.E. 6p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890820.

During 1988, battery technology evaluations were performed for the Department of Energy and Electric Power Research Institute at the Argonne Analysis and Diagnostic Laboratory. Cells and multicell modules from four developers were examined to determine their performance and life characteristics for electric vehicle propulsion applications. the results provide an interim measure of the progress being made in battery R and D programs, a comparison of battery technologies, and a source of basic data for modeling and continuing R and D. This paper summarizes the performance and life characterizations of twelve single cells and six 3- to 24-cell modules that encompass four technologies (Na/S, Ni/Fe, lead-acid, and Fe/Air).

2583 **Analysis of life cycle costs for electric vans with advanced battery systems.** Marr, W.W.; Walsh, W.J.; Miller, J.F. 6p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890819.

The performance of advanced Zn/Br_2, LiAl/FeS, Na/S, Ni/Fe, and Fe/Air batteries in electric vans was compared to that of tubular lead-acid technology. The MARVEL computer analysis system evaluated these batteries for the G-Van and IDSEP vehicles over two driving schedules. Each of the advanced batteries exhibited the potential for major improvements in both range and life cycle cost compared with tubular lead-acid. A sensitivity analysis reveals specific energy, battery initial cost, and cycle life to be the dominant factors in reducing life cycle cost for the case of vans powered by tubular lead-acid batteries.

2584 **Electric vehicle battery R and D in the context of a propulsion system.** Patil, P.G.; Christianson, C.C.; Miller, J.F. 6p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890817.

A battery system for an electric vehicle should be designed and developed in concert with the other components of the propulsion system. Technology development efforts sponsored by the U.S. Department of Energy are addressing all the constituent electric vehicle component technologies, including the battery subsystem technologies, from the perspective of the complete propulsion system. This approach is considered to be essential for three reasons. First, the ultimate viability of a given battery technology can only be assured in the context of a complete propulsion system. Second, many required battery subsystem technology advancements can only be addressed in concert with the other propulsion system components. Third, development and testing of battery subsystem technologies in conjunction with powertrain subsystem technology development is necessary in order to provide essential information to the battery developer and to the vehicle developer that can not be obtained when battery development is performed as a discrete activity.

2585 **Evaluation of state-of-charge indicator approaches for EVs.** Burke, A.F. 11p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890816.

Studies of battery management systems(BMS), including state-of-charge(SOC) algorithms, were performed in the Battery Test and Vehicle Dynamometer Laboratories at the INEL. The test and evaluation of the SOC algorithms indicated that the capacity rate dependent and adaptive approaches to determining battery SOC yielded RMS errors between the indicated and actual states-of-charge of less than 10% if battery temperature and aging effects were not dominate. The BMS tested were not sufficiently accurate and reliable to permit their use as the primary means of charge control during the various INEL test programs. Considerable progress has been made in the development of BMS, but further work is needed before the systems can be used with confidence in either the charge or discharge modes without careful attention from the user.

2586 **Li/FeS battery design for an electric van.** Chilenskas, A.A.; Barlow, G. 4p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890785.

Li-alloy/FeS battery designs, based upon a well-characterized 300-Ah cell developed by Westinghouse Oceanic Division, have been developed for four electric vans currently under development by the U.S. Department of Energy and the Electric Power Research Institute. Computerized cell models were developed to calculate power, energy, weight, and volume values for a cell while varying key design parameters. Battery specifications and vehicle performance are given for the Chrysler TE Van, GMC G-Van, For ETX-11, and the Eaton DSEP.

2587 **Development of advanced battery systems for vehicle applications.** Zagrodnik, J.P.; Eskra, M.D.; Andrew, M.G.; Gentry, W.O. 3p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890783.

The Advanced Battery Business Unit (ABBU) of Johnson Controls, Inc. is developing several promising advanced battery technologies including flow-through lead-acid, zinc/bromine, and nickel hydrogen. The flow-through lead-acid technology, which is being developed under Department of Energy (DOE) sponsorship, is progressing towards the fabrication of a 39 kWh battery system. Recent efforts have focused on achieving the aggressive specific energy goal of 56 Wh/kg in 12 volt module form. Recent DOE sponsored work in the zinc/bromine program has focused on the development of a proof-of concept 50 kWh electric vehicle system for a light van application. Efforts in the nickel hydrogen program have focused on reducing system cost in order to make the life-time premium market and EV market possible targets. The status and future direction of each of these programs are summarized.

2588 **Assessment of EV batteries and application to R and D planning.** Henriksen, G.L.; Patil, P.G.; Ratner, E.Z.; Warde, C.J. 7p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890781.

To guide future EV battery R and D programs, the U.S. Department of Energy (DOE) commissioned a comprehensive assessment of secondary battery technologies. A total of 67 battery developers - from the United States, Canada, Europe, Asia, and Africa - were solicited to submit battery design concepts for an "Improved Dual-Shaft Electric Propulsion" (IDSEP) van. A team of 10 consultants and 7 representatives from DOE laboratories evaluated 42 developer responses and consultant-prepared designs. Using six criteria - five technical/economic criteria and a maturity/technical barriers criterion - the assessment identified 12 most-promising batteries. Employing a generic EV-battery development-system framework, the assessment results are being used to formulate multi-year R and D plans and schedules for the most-promising developmental batteries.

2589 **Zinc electrode and rechargeable zinc-air battery.** Ross, P.N. Jr. To Dept. of Energy, Washington, DC. USA Patent 4,842,963. 27 Jun 1989. Filed date 21 Jun 1988. USA Patent Application 7 209,592. Int. Cl. H01M 8/06. 12p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes an improved zinc electrode for a rechargeable zinc-air battery comprising an outer frame and a porous foam electrode support within the frame which is treated prior to the deposition of zinc thereon to inhibit the formation of zinc dendrites on the external surface thereof. The outer frame is provided with passageways for circulating an alkaline electrolyte through the treated zinc-coated porous foam. A novel rechargeable zinc-air battery system is also disclosed.

29 ENERGY PLANNING AND POLICY

2591 (CONF-8909254–1) **The slowdown of 1989–90: Further evidence for the use of transportation sector indicators to predict GNP growth.** Santini, D.J. Argonne National Lab., IL (USA). [1989]. 33p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From Forecasting in the Transportation Sector session; Philadelphia, PA (USA); 27-28 Sep 1989. Order Number DE90001982. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Research on the interaction of energy cost shocks and macroeconomic activity one year later is reviewed and used to support a prediction that early 1989 increases in crude oil and gasoline prices will lead to declines of auto sales for each of the next three quarters, depressing macroeconomic growth rates in early 1990. Research on the interaction of major product group real cost changes and macroeconomic activity changes one year later is reviewed, showing that energy products are the only products for which statistical evidence supporting a negative interaction exists when using a full century of US data. The post 1929 interactions of various energy types are then examined, showing that gasoline is the fuel which has been responsible for the energy effect since that time. Literature is cited supporting the argument that declines in vehicle sales occur in response to gasoline price increases, and that declines in vehicle sales for the dominant vehicle producer predict GNP. A study showing that regulatory cost increases as well as gasoline price increases depress auto sales is cited. The unfortunate coincident timing of increases in the safety, emissions, and/or fuel economy regulatory costs of the automobile and gasoline price shocks at approximately the time of the last three US recessions is reviewed and compared to the 1989–90 situation. Factors which tend to support an expectation of further rises in crude oil and/or gasoline prices in 1990 are reviewed, and contrasted with those factors tending to support a "soft landing" scenario. 48 refs., 22 figs.

2592 (CONF-8911108–1) **Community relations programs: Improved planning through better understanding of communication systems.** Reeme, T.L.; Young, C.F. Argonne National Lab., IL (USA). [1989]. 15p. Sponsored by U.S. Department of Defense. DOE Contract W-31109-ENG-38. From Superfund '89 conference; Silver Spring, MD (USA); 27-29 Nov 1989. Order Number DE90001909. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Thorough and situation-specific planning is often neglected during development of community relations programs. However, planning is critical to developing effective and ultimately successful programs. Such planning involves several steps: setting goals and objectives, identifying community characteristics, understanding communication systems, determining target audiences, and developing an evaluation scheme. Although crucial to effective planning, the step "understanding communication systems" is often overlooked. This paper therefore emphasizes the importance of understanding communication systems, but also includes brief descriptions of each of the other planning steps. Communication systems generally have seven components or aspects: objects (e.g., receivers, senders, and communication media and messages), attributes of objects, relationships among objects, environments in which the system functions, balance, hierarchical organization, and goal orientation. Each of these components or aspects is described as it pertains to community relations programs, and the main methods for obtaining information about each component or aspect are discussed. 8 refs., 3 tabs.

2593 (CONF-8911117–1) **Disasters and market response: An economists perspective on the management of urban emergencies.** Horwich, G. Oak Ridge National Lab., TN (USA). [1989]. 34p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Conference on energy in Milan: the past, the present, and the future of energy in a modern city; Milan (Italy); 10-11 Nov 1989. Order Number DE90002469. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This study examines the de facto and potential role of markets in disaster anticipation and response. Disasters are defined as any decline in the value of economic resources beyond some socially determined threshold, which varies directly with space and time. In this framework the oil shocks of the 1970s and 1980, which imposed a new regime of relative prices and hence significant losses in the value of the pre-existing allocation of resources, qualify as a disaster. In the United States, government-imposed price ceilings and mandatory allocations delayed the necessary adjustment and added to the total costs of the shock; nor did they increase social

equity in terms of commonly accepted criteria. Free markets have played a major role in the demobilization and recovery following wars, which are disasters of massive proportions. Sociological evidence indicates that individuals rarely panic in the aftermath of disasters and usually respond effectively at a grass roots level; centrally dictated responses and external donations tend not to be sensitive to local conditions or desires. Markets are seen as an institutional supplement and magnifier of spontaneous individual and community adaptive behavior. Government can facilitate the contribution of markets by limiting its own role to coordination and procurement, rather than production, of goods and services obtainable from contestable markets. 41 refs.

2594 (ORNL/FTR–3439) **[Emergency planning for technological and natural hazards]: Foreign trip report, October 1, 1989–October 15, 1989.** Sorensen, J.H. Oak Ridge National Lab., TN (USA). 27 Oct 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002660. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Information was collected on research being conducted in Great Britain on emergency planning for technological and natural hazards. Several recent accidents in England have raised questions about the level of preparedness. In addition, the Seveso directive on emergency planning for chemical facilities is being implemented. Overall research activities regarding emergency planning is not as well developed in England as it is in the United States. Data collected by British researchers complements that found on US disasters, and in some cases fills data gaps in the US. Modeling efforts on chemical exposure following industrial accidents are well developed and our modeling efforts can be improved based on the knowledge derived from the trip. 4 figs.

Plume migration in water- and air-pollution studies, and the analysis of aquatic and terrestrial ecosystems are among the applications considered. (This updated bibliography contains 50 citations, all of which are new entries to the previous edition.)

2598 (PNL-SA–16875) **Integrated computer-based tools to facilitate environmental monitoring, assessment, and restoration.** Cowley, P.J.; Brown, J.C. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891053–8: 28. Hanford life sciences symposium on environmental monitoring, restoration and assessment: what have we learned?, Richland, WA (USA), 16-19 Oct 1989). Order Number DE90002732. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The vast amounts of scientific and technical data gathered during the process of environmental monitoring, assessment, and restoration make the effective application of computer-based tools essential. This paper describes how an integrated set of automated resources is being applied at the Hanford Site to effectively manage the data gathered during site characterization and monitoring and to provide an environment that facilitate analysis and assessment. The Hanford Environmental Information System (HEIS) has upgraded our previous monitoring and characterization capabilities and represents significant advances in our ability to manage, retrieve, and display data. An integrated data base, a geographic information system (that allows data to be displayed on a map), and support graphics allow the user to generate spatially related visualizations and perform data extractions. This allows the user to gain insight quickly and easily by obtaining a complete picture of the data of interest. HEIS also provides the capability to share the information with other software environments for further analysis and assessment. 3 figs.

2599 **Greenhouse gas emission coefficients from the energy system. Two methods to calculate national CO_2-e issions.** Okken, P.A.; Tiemersma, D.N. 24p. Netherlands Energy Research Foundation ECN, Petten (NL) (Oct 1989).

Two methods to calculate national CO_2-emissions, by using official energy statistics and CO_2-emission coefficients for fossil fuels, are described. In the first method (A) the national inland primary energy requirements are multiplied by the CO_2-emission coefficients, assuming all fossil fuels are combusted. In the second method (B) the fossil fuels used as chemical feedstocks (e.g. plastics) are subtracted from the national primary energy requirement, and the CO_2-emissions from registered combustion of feedstocks (e.g. combustion of plastic disposables) are added. In both methods (A and B) the fossil fuel consumption for international bunkers is excluded. Method A clearly overestimates CO_2-emissions because a major part of the petrochemical feedstocks are not combusted: e.g. plastics and bitumen are used as construction materials, plastic-waste is used as landfill. On the other hand method B underestimates CO_2-emissions due to unregistered combustion of petrochemical feedstocks. The actual Netherlands CO_2-emission in 1985 is estimated to be 149 +- 1 Mt CO_2. 2 figs., 26 refs., 12 tabs., 1

2600 (NEI-DK–179) **Report for the period 1 July 1988–30 June 1989 from the Mineral Resources Administration in Greenland.** Raastofforvaltningen for Groenland, Copenhagen (Denmark). 30 Aug 1989. 68p. (In Danish). Order Number DE90705938. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI.

In 1979 Home Rule was introduced in Greenland. In the same year and in relation to the revision of the law on Greenland's mineral resources a Joint Council specializing in this subject, was established. The establishment and administration of this Council is described in detail. For some years the Danish Government and the Home Rule have been negotiating on agreements regarding Greenland's raw materials, and these negotiations are elucidated closely.

The discovery of Cryolite in Greenland is touched upon. A very detailed list of projects, proposed, current and completed, and of applications from foreign firms wishing to make underground investigations to establish the extent of the mineral resources, is given.

2601 (PB–89-224984/XAB) **Innovation and teamwork in the North American waterfowl management plan. Waterfowl Management Handbook.** Hohmann, K. Fish and Wildlife Service, Washington, DC (USA). 1989. 7p. (FISH/WILDLIFE-LEAFLT–13.2.2). Available from NTIS, PC A02/MF A01.

North America's wetland ecosystems are ailing. One symptom is the steady decline in waterfowl populations. The 1988 data show a record low count of northern pintails. The year's fall flight index for all ducks was 66 million, far off the 1987 count of 74 million. Accompanying this was the continued large-scale destruction of wetlands. Between the mid-1950's and 1975, about 9 million acres of wetlands in the lower 48 States were converted to other uses. Today, the United States continues to lose wetlands at the rate of about 450,000 acres annually. Canada's wetlands are also succumbing to development and agriculture. The plan is the first continental program to battle loss of waterfowl and wetlands. In both the United States and Canada, the North American Waterfowl Management Plan is implemented through joint ventures. These joint ventures are teams of Federal, State, and private organizations that work in six regions across the United States. In Canada, there are two regional (Prairie Habitat, Eastern Habitat) and two species-oriented (Arctic Goose and Black Duck) joint ventures.

2602 (PB–89-224992/XAB) **Migration of radio-marked whooping cranes from the Aransas-wood buffalo population: Patterns of habitat use, behavior, and survival. Technical report.** Howe, M.A. Fish and Wildlife Service, Washington, DC (USA). 1989. 40p. (FISH/WILDLIFE-TR–21). Available from NTIS, PC A03/MF A01.

Library of Congress catalog card no. 89-600146.

Use of migration stopovers by radio-marked whooping cranes (Grus americana) between Aransas National Wildlife Refuge, Texas, and central Saskatchewan was studied in fall 1981-83 and spring 1983-84 as part of a cooperative program with the Canadian Wildlife Service. Twenty-seven cranes were monitored for one or several seasons, including nine radio-marked birds and others that associated with them. Whooping cranes showed variations in their use of migration habitats, feeding primarily in a variety of croplands and roosting primarily in palustrine wetlands. More than 40% of the roosting wetlands were smaller than 0.5 ha. Although heavily vegetated wetlands were generally not used, family groups appeared to select more heavily vegetated wetlands than nonfamilies. Juveniles allocated 25% more time to foraging than did parents. Parents increased their foraging rate and showed less alert behavior in spring migration. Dissociation of parents and young occurred late in spring migration and after arrival on the breeding grounds.

2905 Research, Development, Demonstration, and Commercialization

2603 (ACERR–1989) **Alberta/Canada Energy Resources Fund annual review, 1987-88.** Alberta/Canada Energy Resources Research Fund, Edmonton, AB (Canada). 1989. 40p. (In English and French). Available from Alberta Energy and National Resources, Information Centre, 9920-108 Street, Edmonton, Alberta, Canada K1A 0G1.

The Alberta/Canada Energy Resources Research Fund was created in 1976 between the governments of Alberta and Canada to promote and support the development and efficient use of Alberta's existing and potential energy resources to meet the province's and Canada's medium- and long-term energy needs; and to encourage the development of scientific and technical expertise in energy research, development and demonstration in Alberta. The program includes the production, transportation, conservation and utilization of both renewable and nonrenewable (fossil fuel) resources, generally excluding oil sands and heavy crude oil. This review highlights the research activities undertaken during the year. These include recovery of waste heat produced by the refrigeration system of a cattle-slaughtering and meta-packing operation, resulting in a payback period of only 15 months and substantial cost savings; installation of a heat recovery and water recycling system in two Calgary laundries, causing natural gas use to decline by up to 50%; the use of coal rather than natural gas as a fuel in steam operations in several oil sand/heavy oil regions of Alberta; and research programs at the Coal Research Centre at Devon, Alberta, the principal centre for coal research in Western Canada. A financial statement is included.

2604 (AD-A–210412/3/XAB) **Review of facility-technology options and their development status. Final report.** Windingland, L.M.; Frantzis, L.; Teagan, W.P.; Leary, K.J. Army Construction Engineering Research Lab., Champaign, IL (USA). Jun 1989. 102p. (CERL-TR-E–89/09). Available from NTIS, PC A06/MF A01.

This report reviews the status of new energy technologies which are potentially relevant to the Army's needs. It covers technologies having both short- and long-term potential that are being developed by various Government agencies and private firms. For each technology, this report: Describes the technology; Summarizes its status; Identifies its commercial availability; Explains the development programs and the funding organizations; Describes its major cost and performing issues; and Describes the possible Army applications.

2605 (CONF-890659–3) **Supporting independent inventors.** Bernard, M.J. III; Whalley, P. Argonne National Lab., IL (USA). 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 14. annual meeting and international symposium of the Technology Transfer Society; Oak Ridge, TN (USA); 13-16 Jun 1989. Order Number DE90002168. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Independent inventors contribute products to the marketplace despite the well-financed brain trusts at corporate, university, and federal R and D laboratories. But given the environment in which the basement/garage inventor labors, transferring a worthwhile invention into a commercial product is quite difficult. There is a growing effort by many state and local agencies and organizations to improve the inventor's working environment and begin to routinize the process of developing ideas and inventional of independent inventors into commercial products. 4 refs.

2606 (DOE/BP–1177) **Research projects in residential technology.** Paglin, C.; Reinhart, R. USDOE Bonneville Power Administration, Portland, OR (USA). Office of Energy Resources. Mar 1989. 17p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002852. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This booklet provides a brief description of both completed and ongoing research and development projects assigned to the Residential Technology Section. It describes the objective and results of each completed project along with a report title and contact person for each project for more information. For ongoing projects, the objective, the anticipated results and completion dated, and a contact person are provided.

2607 (DOE/BP–1211) **Research and Development report: Fiscal years 1987–1988.** USDOE Bonneville Power Administration, Portland, OR (USA). Office of the Senior Assistant Administrator for Power Facilities. Aug 1989. 77p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002857. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

With this edition, the research and development (R&D) Report goes to a biennial publication schedule and covers the R&D work of two fiscal years–1987 and 1988–at the Bonneville Power Administration (BPA). These pages summarize R&D projects in three program realms– Transmission, Resources, and Fish and Wildlife– to share information and results with customers, industry peers, and personnel within BPA. More detailed spotlights cover endeavors of particular value to the industry and its customers. We hope that this report will stimulate exchange of technical information and will help transfer the results of BPA research to practical applications throughout the region and beyond. For additional information, readers are encouraged to contact the individual project managers and to refer to the bibliography in the Information Resources section.

2608 (DOE/ER–0184/5) **Guide for the preparation of applications for the University Research Instrumentation Program, 1990.** USDOE Office of Energy Research, Washington, DC (USA). University and Industry Programs Div. [1989]. 38p. Sponsored by U.S. DOE Energy Research. Order Number DE90002688. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The University Research Instrumentation (URI) program has been developed as part of an interagency effort under the coordination of the Office of Science and Technology Policy to help alleviate the overall shortage of sophisticated state-of-the-art instruments required for advanced scientific and technical research at universities. The program was initiated in FY 1984 with a recommended funding level in the Energy and Water Development Appropriation Act of $4,000,000. The FY 1990 Congressional appropriation for this program is anticipated to be about $5,000,000.

2609 (LBL-PUB–630-Rev./10-89) **High school honors program, July 23–August 5, 1989: Revision, October 1989.** Lawrence Berkeley Lab., CA (USA). 1989. 69p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90002245. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The High School Honors Program brings together some of the top science students from the United States and several foreign countries. The two-week endeavor is designed to acquaint the students with the latest techniques and advances in the field of Life Sciences and the role of the national laboratories in today's research. Through lectures, laboratories, field trips and assignments, the students are exposed to the way in which research is accomplished at a national laboratory. Time is set aside to consider the social implications of science in an effort to have well-rounded leaders for the future. This report overviews this year's program.

2610 (ORNL/PPA–89/1) **ORNL [Oak Ridge National Laboratory] 89.** Anderson, T.D.; Appleton, B.R.; Jefferson, J.W.; Merriman, J.R.; Mynatt, F.R.; Richmond, C.R.; Rosenthal, M.W. Oak Ridge National Lab., TN (USA). 1989. 59p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002799. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

This is the inaugural issues of an annual publication about the Oak Ridge National Laboratory. Here you will find a brief overview of ORNL, a sampling of our recent research achievements, and a glimpse of the directions we want to take over the next 15 years. A major purpose of ornl 89 is to provide the staff with a sketch of the character and dynamics of the Laboratory.

2611 (PB–89-185763/XAB) **Hostile intelligence threat: US technology.** Whitman, D. Office of the Deputy Under Secretary of Defense for Policy, Washington, DC (USA). Nov 1988. 21p. (DOD–5200-1-PH-2). Available from NTIS, PC A03/MF A01.

This publication outlines the hostile intelligence threat to U.S. industry and Western technology, including the operational capabilities of hostile intelligence services and their scientific and technological (S&T) targets. Current intelligence strategies used against the United States are described and sources of information providing countermeasures guidance are listed. Points of contact for security and counterintelligence assistance are also included.

2612 (SAND–89-1832) **Energy technologies at Sandia National Laboratories: Past, Present, Future.** Sandia National Labs., Albuquerque, NM (USA). Aug 1989. 115p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC04-76DP00789. Order Number DE90001799. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

We at Sandia first became involved with developing energy technology when the nation initiated its push toward energy independence in the early 1970s. That involvement continues to be strong. In shaping Sandia's energy programs for the 1990s, we will build on our track record from the 70s and 80s, a record outlined in this publication. It contains reprints of three issues of Sandia's Lab News that were devoted to our non-nuclear energy programs. Together, they summarize the history, current activities, and future of Sandia's diverse energy concerns; hence my desire to see them in one volume. Written in the fall of 1988, the articles cover Sandia's extremely broad range of energy technologies – coal, oil and gas, geothermal, solar thermal, photovoltaics, wind, rechargeable batteries, and combustion.

2613 (STU-I–707-1988) **Evaluation of the contributions made by STU (National Swedish Board for Technical Development) to the sphere of energy. Summary and conclusions.** Granholm, A.; Liff, R. Swedish National Board for Technical Development, Stockholm (Sweden). Nov 1988. 93p. (In Swedish). Order Number DE90719394. Available from NTIS (US Sales Only), PC A05/MF A01.

The aim of this evaluation is to provide conditions for improving the quality of the organization. The results of the energy research program are presented. New methods of evaluation have been tested. The study consists of 5 points: - analysis of purposes, - survey of programs, - case studies, - organizational development, - conclusions. The project has taken one year to accomplish. (G.B.).

2906 Nuclear Energy

Refer also to citation(s) 2188, 2466, 2467, 2509, 2556, 2804, 4403

2614 (INIS-BR–1743) **Brazilian nuclear policy with respect to the public opinion.** Freitas Brandao Bittencourt, C. Escola de Comando e Estado-Maior do Exercito, Rio de Janeiro, RJ (Brazil). 1988. 67p. (In Portuguese). Order Number DE90608868. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

Four decades of the Brazilian nuclear history have been analysed with special emphasis placed on government policy and its repercussion on public opinion. The implications of the new constitutional regulations which rule the issue are discussed. it is also studied the change in the nuclear program structure, enforced in August 1988. At different times, the government decisions on nuclear energy could be classified as miser, extravagant, dissimulated and frank, successively. Their aftermaths, which show little consistency with the expectations laid on them, have led to discredit by part of the society, which is controlled by a scientific - intellectual elite. However, recent successes are likely to reverse this trend, if the government explores them properly. (author).

2615 (PNL-SA–16907) **1988 changes to United States law regarding nuclear third party liability.** Cunningham, G.H. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-8909123–1: Meeting of the International Nuclear Law Association, Tokyo (Japan), 25-28 Sep 1989). Order Number DE90001902. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Price-Anderson Amendments Act of 1988 has introduced sweeping changes into the nuclear third party liability regime in the United States. The basis principle that a single, assured source of funds for compensation of those injured by a nuclear incident, regardless of the party actually at fault, has been maintained. The amount of such funding has been increased tenfold, to more than $7 billion, with a commitment that even more will be made available by the Congress, if needed. The scope of compensable injury has been broadened to include precautionary evacuations. With respect to contractors carrying out the defense-related nuclear activities of the Government, the changes have been equally momentous. The ceiling on Government idemnification has risen to keep pace with the maximum amount of licensee liability. Provisions designed to provide greater incentive to adherence to all nuclear safety standards have been added, authorizing the imposition of substantial civil and criminal sanctions for violations.

2616 **Probabilistic risk assessment in the nuclear power industry.** Fullwood, R.R.; Hall, R.E. 318p. Pergamon Books Inc., Elmsford, NY (1988).

This book describes a number of the more important improvements in risk assessment methodology in the nuclear industry, developed over the last decade. It presents them in an instructive way so as to be suitable for those wishing to understand the techniques. The methodology of modern probabilistic risk assessment (PRA) is discussed in detail. This book is divided into six parts: Protecting the public health and safety; Mathematics; Safety aspects of light water nuclear power plants; PRA; 34 types of applications of PRA; Resources.

2617 **Nuclear power technical co-operation in the Republic of Korea.** Islam, M.M. (International Atomic Energy Agency, Vienna (Austria)); Fischer, J.; Calori, F. *International Atomic Energy Agency Bulletin (IAEA)*, 31(2): 41-44 (1989).

The Republic of Korea has an extensive nuclear programme involving power reactors, research reactors, and nuclear fuel cycle facilities. During 1988, nuclear power contributed 46.9% of the total electricity generated in the country. Figs.

2907 Transport and Storage

2618 (DOE/PE–0093) **Assessment of costs and benefits of flexible and alternative fuel use in the US transportation sector: Technical report three: Methanol production and transportation costs.** USDOE Assistant Secretary for Policy, Planning and Analysis, Washington, DC (USA). Office of Policy Integration. Nov 1989. 46p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002625. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The Department of Energy (DOE) in 1988 undertook a comprehensive technical analysis of a flexible-fuel transportation system in the United States. To keep interested parties informed about the progress of the DOE Alternative Fuels Assessment, the Department periodically publishes reports dealing with particular aspects of this complex study. This report provides an analysis of the expected costs to produce methanol and of several related issues. 17 refs., 21 figs., 44 tabs.

2908 Waste Heat Utilization

2619 **Cogeneration- and Total Energy potentials at an alternative natural gas price policy and environmental policy in the Dutch National Energy Outlook scenarios.** (WKK- en TE-potentielen bij een alternatief gasprijs- en milieubeleid in de NEV-scenario's). Boonekamp, P.G.M.; Verhagen, L. 31p. Netherlands Energy Research Foundation ECN, Petten (NL) (Sep 1989). (In (In Dutch)).

By request of the Dutch Ministry of VROM (public health, planning and environment) the Energy Study Centre of the Netherlands Energy Research Foundation carried out new calculations with regard to the title subject. New developments in the Dutch energy and environmental policies made that necessary. For eight cases the results for large-scale industrial cogeneration capacity are presented, i.e. the future industrial steam demand with gas turbine-, combined steam and power generation-, total energy gas- and total energy coal-installations or with coal- or gas boilers. The same calculations are made for small-scale Total Energy capacities. Finally some conclusions are given with regard to the total cogeneration potential. 8 tabs.

Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG01-88CE27489. From ACEEE summer study on energy efficiency in buildings; Asilomar, CA (USA); 29 Aug - 1 sep 1988. Available from ACEEE, 1001 Connecticut Ave., NW, Washington, DC 20036.

These fifteen refereed papers and summary reports reflect a range of residential and commercial energy management tools and strategies. Presentations are organized under five session subheadings: Institutional Energy Management (governments and schools), Government/Utility Partnerships, Target Marketing Strategies, Energy Performance Contracting, and Integrated Multi-Agency Programs. The conference proceedings include eleven volumes of technical papers and project summaries (organized by panel topic) and an index volume. The refereed papers included in the proceedings were peer-reviewed and authors have incorporated comments from panel leaders and reviewers. In addition, conference participants receive a conference program volume which includes abstracts of the papers, posters, and workshops.

2621 (DOE/CE/64615–T2-Exec.Summ.) **Developmental state programm for institutional conservation: Executive summary: Final technical report, October 1, 1986–September 30, 1988.** New Mexico Energy and Minerals Dept., Santa Fe, NM (USA). 1989. 23p. DOE Contract FG01-86CE64615. Order Number DE89009245. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The New Mexico Energy, Minerals and Natural Resources Department (EMNRD) was established in 1978 as the state government agency responsible for the development and management of New Mexico's energy, mineral and natural resources. This document is the department's report on an innovative project initiated in 1986 entitled "Developmental State Programs for Institutional Conservation."

2622 (LBL–27289) **Policies and programs for promoting energy conservation in the residential sector: Lessons from five OECD [Organization for Economic Cooperation and Development] countries.** Wilson, D.; Schipper, L.; Tyler, S.; Bartlett, S. Lawrence Berkeley Lab., CA (USA). Jun 1989. 206p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002605. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

In this report we describe national residential energy conservation policies and programs in five countries. Within supply and demand contexts, we describe the governments' stated energy policies, the structure of and relationships among the various institutions responsible for establishing and implementing those policies, and the programs they developed. This information is presented country by country, in what we call "country reports." In addition, we refer to national residential energy conservation programs in the United States. The purpose of this is to establish the setting in which our work is expected to be used; the reader can use this information in order to make his/her own comparisons with the five countries. 112 refs., 9 figs., 26 tabs.

2920 Supply, Demand, and Forecasting

Refer also to citation(s) 2604, 2627, 2632

2623 (DOE/EIA–0202(89/4Q)) **Short-term energy outlook: Quarterly projections.** USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use. Oct 1989. 58p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002872. Available from NTIS, PC A03/MF A01 - GPO - OSTI; GPO Dep.

The Energy Information Administration (EIA) quarterly forecasts of short-term energy supply, demand, and prices are revised in January, April, July, and October for publication in the Short-Term Energy Outlook (Outlook). An annual supplement analyzes previous forecast errors, compares recent projections by other forecasters, and discusses current topics of the short-term energy markets (see Short-Term Energy Outlook: Annual Supplement, DOE/EIA-0202). The principal users of the Outlook are managers and energy analysts in private industry and government. The projections in this volume extend through the fourth quarter of 1990. The forecasts are produced using the Short-Term Integrated Forecasting System (STIFS). The STIFS model uses two principal driving variables: a macroeconomic forecast and world oil price assumptions. Macroeconomic forecasts produced by Data Resources, Inc. (DRI), are adjusted by EIA to reflect EIA assumptions about the world price of crude oil, energy product prices, and other assumptions which may affect the macroeconomic forecast. EIA's Oil Market Simulation Model is used to project world oil prices. (The EIA models are available on computer tape and diskette from the National Technical Information Service.) The three featured projections for petroleum supply and demand are based on low, middle, and high economic growth assumptions coupled, respectively, with high, middle, and low crude oil price trajectories. The discussion and tables in this

volume refer primarily to the middle, or base case, scenario and, unless otherwise noted, to the domestic situation. Table 7 summarizes the petroleum sensitivity cases and indicates the separate contributions to the alternative cases of price, macroeconomic conditions, and weather.

2624 (LBL–27131) **Least-cost planning in the utility sector: Progress and challenges: Volume 2, Technical appendix.** Goldman, C.A.; Hirst, E.; Krause, F.; Anderson, K.; Berry, L.; Eto, J.; Geller, H.; Harris, J.; Levine, M.; Meier, A.; Rosenfeld, A.; Sabo, C.; Vine, E.; Wiel, S.; Wodley, C. Lawrence Berkeley Lab., CA (USA). Jun 1989. 50p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002612. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report is the technical appendix of an LBL/ORNL study that was commissioned by the Department of Energy to review recent progress in least-cost utility planning in the United States, entitled "Least-Cost Utility Planning in the Utility Sector: Progress and Challenges. This appendix contains the contributions of many authors on important topics related to integrated resource planning. The editors used this material as the basis for the study and formulation of recommendations regarding priorities for future work on least-cost planning. 44 refs., 3 tabs.

2625 (NEI-SE–44) **Energy in Sweden 1988.** Energy in Sweden. Statens Energiverk, Stockholm (Sweden). Jun 1988. 15p. Order Number DE90719396. Available from NTIS (US Sales Only), PC A03/MF A01.

Energy in Sweden.; The publication has got wrong ISSN-number. Should be ISSN-0282-7107.

Energy in Sweden 1988 is intended for politicians, administrators, businessmen, journalists, teachers and others who are interested in obtaining up-to-date problem oriented information The paper provides information about the energy situation- developments and forecasts concerning both energy use and energy supply, advances in energy research, current assessments of energy prices, the environmental impact of using different forms of energy etc. The total quantity of energy supplied in 1987, amounting to 455 TWh, of which almost one third was in the form of electricity was approximately the same as in 1970.

2626 (RISO-M–2798) **Simulation of the Italian energy system with the DESS-model.** Halsnaes, K.; Soerensen, H. Risoe National Lab., Roskilde (Denmark). Jun 1989. 69p. Order Number DE90718930. Available from NTIS (US Sales Only), PC A04/MF A01.

This report describes a simulation of the Italian energy system for the period 1980 to 2000 with the energy simulation model DESS (Detailed Energy Simulation System). The Italian model comprises a detailed database for the most important part of the energy demand and conversion system. This database is split into the following five parts: the building stock, district heating, power system, the process sector, and the transport sector. As a result of the simulation a total gross energy balance for Italy is generated. The actual simulation referred to in this report is made according to some main assumptions in the National Italian Energy Plan where nuclear power production is kept constant and all new constructed power plants are coal fired. 2627 (DOE/CH/10348–1, pp. 49-68) **The electric-utility industry perspective.** Yeager, K.E. Illinois Univ., Chicago, IL (USA). Energy Resources Center. 1987. (CONF-8711295–: 15. annual Illinois energy conference: transition to an energy secure economy, the changing economic and regulatory scene, Chicago, IL (USA), 10-11 Nov 1987). In *Transition to an energy secure economy: The changing economic and regulatory scene. Proceedings.* Order Number DE89008864. Available from NTIS, PC A09/MF A01.

This paper offers some thoughts on energy sector competition from the utility industry perspective. Electricity plays a central role in the nation's economy and is one of our productivity advantages in the ultimate global market competition. Changes in regulatory policy and underlying economics has substantially changed the business environment. Further changes are likely. About 3,200 independent organizations make up the utility industry and share a complex business environment. These organizations differ in many ways: in ownership form, size, capitalization, cost, structure, type and variety of services, markets, marketing efforts, type and composition of fuels used, degree of environmental constraints faced, and regulatory operating conditions. Response to an uncertain and competitive environment is taking two general forms of either bulk power producers or brokering and distribution of power produced by others. Some may pursue a mixed technology. With either strategy, reducing capital and O&M costs is an integral component. Competitiveness demands a strong technological response. Over 80% of total assets, over $500 billion, is invested in sophisticated generation, transmission, and distribution plants. The Electric Power Research Institute has a strong research program to provide new planning and management tools, and new technologies needed in a changing marketplace. Research initiatives are directed to; (1) controlling costs with, productivity improvements, developing next-generation power plants, and improving transmission and distribution system performance, and (2) enhancing markets with, better understanding of customer needs, and more productive use of electricity. Promising new and improved technologies are now available and under development to keep electric utilities vital and competitive.

2628 (DOE/EIA–0109(89/08)) **Petroleum supply monthly, August 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. 27 Oct 1989. 127p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002595. Available from NTIS, PC A07/MF A01 - GPO - OSTI; GPO Dep.

This is one of a family of three publications produced by the Petroleum Supply Division within the Energy Information Administration (EIA) reflecting different levels of data timeliness and completeness. The other two publications are the Weekly Petroleum Status Report (WPSR) and the Petroleum Supply Annual (PSA). Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 states and the District of Columbia). The reporting universe includes those petroleum sectors in "Primary Supply." Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United States. Data presented in the PSM are divided into two sections (1) the Summary Statistics and (2) the Detailed Statistics.

2629 (DOE/EIA–0130(89/08)) **Natural gas monthly, August 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas. 31 Oct 1989. 171p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002592. Available from NTIS, PC A08/MF A01 - GPO - OSTI; GPO Dep.

The NGM highlights activities, events, and analyses of interest to public and private sector organizations associated with the natural gas industry. Volume and price data are presented each month for natural gas production, distribution, consumption, and interstate pipeline activities. Producer-related activities and underground storage data are also reported.

2630 (DOE/EIA–0219(88)) **International energy annual, 1988.** USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use. 7 Nov 1989. 185p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002569. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

The International Energy Annual presents current data and trends for production, consumption, stocks, imports, and exports of primary energy commodities in more than 190 countries, dependencies, and areas of special sovereignty. Also included are prices on crude oil and petroleum products in selected countries. This report is published to keep the public and other interested parties fully informed of primary energy supplied on a global basis. The data presented have been largely derived from published sources and from reports US Embassy personnel in foreign posts (refer to sources listed in Appendix D). The data have been converted to units of measurement and thermal values (Appendices A and B) familiar to the American public.

2631 (LBL–25674-Rev.) **The role of oil in electricity generation in five European countries: Past, present, and potential.** Hawk, D.V.; Schipper, L. Lawrence Berkeley Lab., CA (USA). Oct 1989. 49p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90003297. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The annual primary oil demand of five European countries — France, Germany, Italy, England & Wales, and Sweden — declined by approximately 25% between 1973 and 1986. Nearly one-third of this decline is the result of the phasing-out of oil for use in electricity generation. In 1973, oil was the first- or second-most important energy source for electricity generation in all of these countries — generating between 14% and 59% of electricity produced. By 1986, oil's share of electricity generation had declined to between 1.5% and 5.6% in all countries except Italy (39.4%), where oil is still being used for base-load generation. In England & Wales and Sweden, oil-based generation may soon increase above 1986 levels. In Sweden, oil-based generation will be used to bridge a supply gap that will result from the decommissioning of nuclear power plants in the absence of new generation capacity to replace them. Although oil-fired electricity generation may increase above 1986 levels in the near future in some countries, the maximum potential levels of oil-based generation calculated in this report will not be attained in any of the countries unless a major electricity-generation resource or technology suffers a severe, unforeseen disruption. In the absence of such a disruption, institutional barriers against dependence on oil will preclude the realization of the existing potential. Nonetheless, the hidden potential for oil use in the power sector, represented by the existing oil-fired capacity, must not be forgotten. As institutions and political agendas evolve, so too might attitudes regarding oil use.

2632 (CONF-8909242–1) **Guidelines for a "good" integrated resource plan.** Hirst, E. Oak Ridge National Lab., TN (USA). 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From National Association of Regulatory Utility Commissioners conference; Charleston, SC (USA); 10-13 Sep 1989. Order Number DE90001642. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During the past several years, more and more electric utilities have prepared long-term resource plans that integrate demand-side programs into the utility's mix of energy and capacity resources. Although several organizations have enumerated the number of states with laws or regulations requiring utilities to prepare such plans, no one has yet reviewed enough plans to assess utility progress in integrated-resource planning and to develop criteria for what constitutes a good plan. This paper offers initial guidelines, an early output from an ongoing project at Oak Ridge National Laboratory. 14 refs., 3 figs., 3 tabs.

2633 (CONF-8909242–2) **The practice of utility least-cost planning: A report on a study-in-progress.** Schweitzer, M. Oak Ridge National Lab., TN (USA). Sep 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From National Association of Regulatory Utility Commissioners conference; Charleston, SC (USA); 10-13 Sep 1989. Order Number DE90002489. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Oak Ridge National Laboratory (ORNL) has conducted a number of studies on the subject of utility least-cost planning in recent years. This paper presents the findings from two of these projects, one focusing on planning for uncertainty and the other examining the overall resource planning process. Altogether, resource plans were obtained from 29 utilities and three state agencies, selected on the basis of their reputation for competent planning. To date, about half of these plans have been reviewed in detail, and site visits have been made to four utilities and one public interest group active in this field. 15 refs., 3 figs.

2634 (DOE/EIA–0226(89/08)) **Electric power monthly, August 1989.** USDOE Energy Information Administration, Washington, DC (USA). Office of Coal, Nuclear, Electric and Alternate Fuels. 14 Nov 1989. 169p. Sponsored by U.S. DOE Management & Administration. Order Number DE90003093. Available from NTIS, PC A09/MF A01 - GPO - OSTI; GPO Dep.

The Electric Power Monthly (EPM) is prepared by the Electric Power Division; Office of Coal Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); Department of Energy. The purpose of this publication is to provide energy decisionmakers with accurate and timely information. The EPM presents monthly summaries of electric utility statistics at the national, Census division, and State level for net generation, fuel consumption, fuel stocks, quantity and quality of fuel, cost of fuel, electricity sales, and retail prices of electricity. Data on net generation are also displayed at the North American Electric Reliability Council (NERC) region level. Additionally, company and plant level information are published in the EPM on capability of new plants, net generation, fuel consumption fuel stocks, quantity and quality fuel, and cost of fuel. 10 refs., 1 fig., 40 tabs.

2635 (LBL–27450) **Evaluation methods in competitive bidding for electric power: Volume 2, Technical appendix.** Kahn, E.P.; Goldman, C.A.; Stoft, S.; Berman, D. Lawrence Berkeley Lab., CA (USA). Jun 1989. 64p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC03-76SF00098. Order Number DE90003298. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Private suppliers of electricity that participate in competitive auctions must specify a multi-year price trajectory. It may be desirable for some bidders to propose prices that exceed the buyer's estimate of value in the short run, but still offer substantial long run benefits. Prices of this kind are called "front loaded." From the buyer's perspective, bids which are front loaded are somewhat undesirable. They impose upon the buyer the risk that the long run benefits will not materialize if the supplier terminates delivery pre-maturely. In this appendix, we develop a model to evaluate front-loaded bids, which we call the implicit loan (IL) method. In this model, we view front-loading to be a loan from buyer to seller. This notion, which has been suggested informally in the past, is formalized and made the basis for an explicit analytic evaluation method.

2636 (LBL–27748) **Key issues in developing demand-side bidding programs.** Goldman, C.A.; Hirst, E. Lawrence Berkeley Lab., CA (USA). Sep 1989. 14p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. (CONF-8911105–1: ECNE national conference on demand-side management, Boston, MA (USA), 16-17 Nov 1989). Order Number DE90002455. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Several utilities in New England have conducted pilot bidding programs for demand-side resources, while integrated bidding processes, which include DSM resources, are currently being planned or implemented by utilities in New York, New Jersey, and Washington. In this study, we examine several resource planning and program implementation issues that are raised by competitive bidding programs for DSM resources: the choice of combined or separate bidding for demand and supply resources, the criteria used to rank and select projects proposed by bidders, the value of DSM resources, the role of non-price factors, and issues that arise in measuring the impact of DSM programs. We compare the bid evaluation systems used by four utilities that are conducting integrated bidding programs and examine the nominal weights assigned to various features (e.g., price, project status/viability, system optimization, environmental factors) by each utility. We conclude that bidding may have a limited role in a utility's overall DSM

strategy because bidding mechanisms are inappropriate for various types of programs and because of the relative immaturity of the energy services industry. 8 refs., 2 figs.

2637 (LiU-Tek-Lic–1989-13) **MINTOP industrial load management system.** Linkoeping studies in science and technology. (no. 173). Karlsson, B. Linkoeping Univ. (Sweden). Dept. of Mechanical Engineering. Mar 1989. 158p. (In Swedish). Order Number DE90719413. Available from NTIS (US Sales Only), PC A08/MF A01.

Linkoeping studies in science and technology.; (no. 173).

In the near future the demand for electric energy and power in Sweden will be larger than the supply. The reason for this is, among other things, the planned nuclear phase-out. Therefore, an important measure will be to adapt the demand to the production capacity. The report describes what can be accomplished to adapt the industrial needs to the supply of electric power and energy, by means of a so-called industrial load management. This paper presents a newly developed system called MINTOP which can be used for performing load management measures in the industry. The system is based on personal computers, and communicates through a two-wired link by means of simple measurement/controlling modules which are placed near the objects that are being supervised or controlled. The system contains information about the current electric tariff which means that the control will be in an optimal way for the customer. Furthermore, the system can be used for inter-company debit, and in this way it provides a more adequate distribution of the industrial power- and energy costs. In the report, results from two load management installations, carried out at companies in the foundry industry, are presented. The pay back period for the two systems is, in each case respectively, about one year with an annual saving of SEK 200000-300000, based on the power tariffs for 1989. (author) (With 93 figures and 4 tables).

2638 (NEI-SE–43) **Electricity supply in Sweden 1988.** KRAFTSAM, Stockholm (Sweden). 1989. 30p. (In Swedish). Order Number DE90719395. Available from NTIS (US Sales Only), PC A03/MF A01.

This survey is produced by Kraftsam which is a joint organization of electric power producers constituted by the Swedish State Power Board and the Swedish Power Association. The summary includes total energy consumption, electricity consumption electric energy balance, load variations and power balance. Hydro power and nuclear power production is presented. Conventional thermal power and new production plants are dealt with and joint operation of interconnected power network is described.

2639 (NERC–90002691) **1989 reliability assessment: The future of bulk electric system reliability in North America, 1989–1998.** North American Electric Reliability Council, Princeton, NJ (USA). c Sep 1989. 88p. Available from North American Electric Reliability Council, 101 College Road East, Princeton, NJ 08540-6601.

A reliable supply of electricity is essential to the economic well-being and security of the United States and Canada. While aggregate utility plans will support the forecast growth in peak demand, this report identifies a widespread trend of actual peak demands consistently exceeding forecasts. If this trend continues, supply deficiencies are likely by the early 1990s in the eastern half of the United States and Canada. Several geographic areas are also identified where electric system reliability is at serious risk. Emergency operating measures, including controlled interruptions of customers' supply, will become more widespread in these areas. Key issues and threats to reliability discussed in the report are: economy versus reliability; disincentives; use of transmission systems; environmental policy; and non-utility generation.

2640 (PB–89-218754/XAB) **Dynamic cooperative electricity exchange in a power pool. Research report.** Ruusunen, J.; Ehtamo, H.; Haemaelaeinen, R.P. Helsinki Univ. of Technology, Espoo (Finland). Systems Analysis Lab. Apr 1989. 34p. Available from NTIS, PC EE03/MF A01.

A new approach to design the transaction agreement in an electric power pool is proposed. The electricity exchange takes place over a fixed time interval in a stochastic environment. No monetary payments between the utilities take place. The contract definition problem is approached from the point of cooperative game theory. In each period the contract is adjusted such that fair division of the cost savings is obtained.

2641 (SV–2000-352-2) **Industrial load management at Vaargaarda.** Bjoerk, C.; Bjarne, E. Swedish State Power Board, Vaellingby (Sweden); Linkoeping Univ. (Sweden). Dept. of Mechanical Engineering. 30 Dec 1987. 84p. (In Swedish). (LITH-IKP-R–507). Order Number DE90719412. Available from NTIS (US Sales Only), PC A05.

In connection with the energy mapping and total power consumption measurements done at Vaargaarda industries, a study of the possibilities of industrial load management was carried out. Some industries outside Vaargaarda were included as well. The report contains an account of the electric energy and power demands of all companies in the study, their highest loads, and to what extent the possibilities of load management have been identified. Three different estimates of potential are presented. 1. Possible power reduction from technical point of view. 2. Today economically justified load management measures. 3. Likely steps taken by the companies (with or without backing from the State Power Board). The possible reduction from technical point of view lies between 2 to 3 MW (of a total subscribed power of not quite 6 MW). The other potentials are lower. The report presents a proposal for further actions and an attempted power and energy prognosis for the Vaargaarda industries. Regarding the remaining industries i.a. the result of simulations for a wire mill is presented. A reduction of the maximum power consumption with 25% would be possible.

2642 **Danish electricity supply. Statistics 1987.** (Dansk elforsyning. Statistik 1987.). 48p. Danish Association of Electricity Supply Undertakings, Lyngby (1988). (In Danish).

Published annually.

The Danish Association of Electricity Supply Undertakings each year issues the statistical yearbook "Danish Electricity Supply." By the means of brief text, figures, and tables, a description is given of the electric supply sector. The topics that are treated are production and consumption of electric power, production of heat, fuel consumption, the power plants and transmission system, and economy and prices of electric power. Each year a specific topic is treated in a supplementary article. (In)

2980 Consumption and Utilization

2643 (DOE/BP–1223) **Electricity use in the Pacific Northwest: Utility historical sales by sector, 1988 and preceding years.** USDOE Bonneville Power Administration, Portland, OR (USA). Sep 1989. 167p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002856. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Electricity Use in the Pacific Northwest: Utility Historical Sales by Sector, 1988 & Preceding Years is intended to enable detailed examination of annual regional electricity consumption. It provides electricity consumption statistics covering the time period 1970–1988 and also provides observations based on statistics covering the 1983–1988 time period. This report also officially releases the compilation of regional 1988 consumer sector sales data by the Bonneville Power Administration. The electricity use report is the only information source which provides data obtained from each utility in the region based on the amount of electricity they sell to consumers annually. Data is provided on each consumer sector: residential, commercial, industrial, direct-service industrial, and irrigation. Other reports typically examine electricity consumption trends by all utilities or by utility groups such as private and public utilities and do not include sector breakdowns.

2644 (DOE/PE–0092) **Energy conservation trends understanding the factors that affect conservation gains in the US economy.** USDOE Office of Policy, Planning and Analysis, Washington, DC (USA). Sep 1989. 40p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002648. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report presents the results of an updated analysis of energy-conservation trends conducted by the Department of Energy (DOE).

The purpose of the analysis was to document and explain the conservation gains that have been achieved and to estimate the effect of lower energy prices on additional gains that are likely to occur. The results provided the basis for evaluating conservation's past and future role in an energy policy context. The results presented in this report cover the period from 1972 to 1986 retrospectively, the recent experience from 1986 to 1989, and the future through 1995. Changes in energy-use and -efficiency patterns are examined for the US economy as a whole, for each end-use sector – residential, commercial, industrial, and transportation – and in comparison to trends in other industrialized countries.

2645 (EPRI-CU–6546) **1988 survey of residential-sector demand-side management programs: Final report.** Blevins, R.P.; Miller, B.A. Electric Power Research Inst., Palo Alto, CA (USA); Battelle Columbus Div., Mount Pleasant, PA (USA). c Oct 1989. 351p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The residential sector presents a wealth of demand-side management (DSM) opportunities for electric utilities. This report, which provides the results of a survey that identified and collected descriptive information on residential-sector DSM activities, can help utilities tap these opportunities. The survey provides summary information on 1022 separate residential programs conducted by 485 electric utilities. These programs, which reflect a diversity of utility objectives, technological focuses, incentive structures, and market implementation techniques, offer valuable sources of reference to utility planners. 35 figs., 45 tabs.

2646 (LBL–22642) **Residential energy demand in the six OCED countries: Historic trends and future directions.** Ketoff, A.; Bartlett, S.; Hawk, D.; Meyers, S. Lawrence Berkeley Lab., CA (USA). Jul 1987. 53p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002610. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report describes trends in residential energy consumption for the six largest OECD countries: the United States, France, Germany, Italy, Japan, and the United Kingdom. The focus is on how and why the demand for the different fuels – oil, gas, solids, and electricity – has been changing, and where the trends are leading residential energy use. 29 refs., 35 figs., 9 tabs.

2990 Unconventional Sources and Power Generation

2647 (ETSU-GEN–2006-P2) **Electricity producing renewable energy technologies common costing methodology. V. 2.** Y-ARD Ltd., Glasgow (UK); Department of Energy, London (UK); UKAEA Harwell Lab. (UK). Energy Technology Div. 1989. 99p. (YM–5501). Order Number DE90722761. Available from NTIS (US Sales Only), PC A05.

This initial study has been mainly occupied in examining prime sources of costing data in reports concerning the future development of renewable energy technologies in the United Kingdom. The level of detail, major assumptions and quality of the data, have been examined with a view to: (a) assessing the feasibility of developing cost estimation relationships;(b) identifying areas of both commonality and divergence between different technologies; and (c) presenting an initial cost comparison based on current data. The study has been limited to the following technologies: (i) horizontal axis aerogenerators, both onshore and offshore, rated in excess of one megawatt; (ii) wave energy devices, concentrating on the Edinburgh/Salter Duck and SEA Circular Clam; (iii) tidal power, concentrating on the Cardiff/Weston Severn barrage and some smaller schemes, and (iv) Geothermal Hot Dry Rocks, Organic Rankine Cycle. The conclusion of the study is that there is insufficient detail available in the data to develop a common costing methodology for these technologies at present. A considerable amount of work needs to be done before the Department of Energy can have any confidence when comparing the costs of these schemes. (UK).

30 DIRECT ENERGY CONVERSION

3001 MHD Generators

2648 (DOE/PC/79680–T2) **Computer controlled MHD power consolidation and pulse-generation system: Technical progress report, October 1988–March 1989.** Johnson, R.; Marcotte, K.; Donnelly, M. Montana State Univ., Bozeman, MT (USA). Dept. of Electrical Engineering. [1989]. 9p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79680. (ERL–290666-1). Order Number DE90001224. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The major goal of this research project is to establish the feasibility of a power conversion technology which will permit the direct synthesis of computer programmable pulse power. Feasibility will be established by demonstration of direct synthesis of commercial frequency power by means of computer control. The power input to the conversion system is assumed to be a MHD Faraday connected generator which may be viewed as a multi-terminal d.c. source. This consolidation/inversion process is referred to subsequently as Pulse-Amplitude-Synthesis-and-Control (PASC). A secondary goal is to deliver a controller subsystem consisting of a computer, software, and computer interface board which can serve as one of the building blocks for a possible phase II prototype system. This report contains discussions on the following areas: description of test transformer configurations for preliminary testing of the PASC power supply and computer control subsystems; results of test transformer testing; conclusions from preliminary testing results and new PASC configuration; control algorithms and data acquisition; feasibility demonstration testing. 16 figs.

2649 (DOE/PC/90274–T6) **MHD [Magnetohydrodynamics] Integrated Topping Cycle Project: Fourth quarterly technical progress report, May 1, 1988–July 31, 1988.** TRW Space and Technology Group, Redondo Beach, CA (USA). Applied Technology Div. Feb 1989. 143p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC90274. (MHD-ITC–89-012). Order Number DE90002868. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

The scope of work covered by this quarterly report encompasses primarily 50 MW_t power train data analysis and design support engineering for the prototypical hardware. Analysis of the 50 MW_t power train data continued to focus on investigation of the causes of the observed "power shortfall." Slag layer leakage and incomplete combustion effects were evaluated and channel analyses were performed to match the experimental data to theoretical predictions. Three major design support activities for the prototypical combustor are underway. Design confirmation tests of the 50 MW_t combustor were conducted at TRW to investigate the effects of prototypical configurations on combustor performance. Tests were also conducted at the 20 MW_t scale, utilizing an ash-injected combustor coupled to a CFC second stage to evaluate power output as a function of operating conditions and hardware configurations. Testing of the one-third scale combustor cold flow model continued, with emphasis on evaluating mixing performance in the exit and second stage. Prototypical combustor design activities focused on design requirements development, materials studies, and design configuration analyses. Both the materials studies and configuration analyses identified new and potentially better approaches to the prototypical combustor design. 78 figs.

3004 Thermionic Converters

2650 (UCID–21775-Vol.1) **Safety evaluation report for Galileo: Volume 1.** Joyce, J.P.; Gray, L.B.; Huff, D.A.; Ullian, L.J.; Kaisler, K.L.; Benz, F.J.; Brown, R.H.; Channell, D.B.; Fletcher, R.F.; Marshall, J.W.; Parker, L.C.; Reynolds, J.R.; Seabourn, C.M.; Thornton, M.A.; Wilhite, A.W.; Ailor, W.H. III; Baker, R.L.; Blaylocck,Lawrence Livermore National Lab., CA (USA); Interagency Nuclear Safety Review Panel (USA). Sep 1989. 94p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (INSRP–89-01-Vol.1). Order Number DE90003086. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Two General Purpose Heat Source Radioisotope Thermoelectric Generators (GPHS RTGs) provide the prime source of electric power for the spacecraft on the Galileo mission. In addition, 120 Light-Weight Radioisotope Heater Units (LWRHUs) provide heat for numerous spacecraft components. The use of radioactive material in RTGs and LWRHUs for the Galileo mission necessitates evaluation of the radiological risks. This Safety Evaluation Report presents the results of the evaluation performed by the Interagency Nuclear Safety Review Panel (INSRP) and its subpanels. Source material consulted for this evaluation included the Galileo Program Office Final Safety Analysis Report, safety test results, and launch vehicle and component historical data. In addition, independent analyses were conducted by INSRP and its subpanels. 20 refs., 17 figs., 11 tabs.

2651 (UCID–21775-Vol.2) **Interagency Nuclear Safety Review Panel: Safety evaluation report for Galileo: Volume 2.** Joyce, J.P.; Gray, L.B.; Huff, D.A.; Ullian, L.J.; Kaisler, K.L.; Benz, F.J.; Brown, R.H.; Channell, D.B.; Fletcher, R.F.; Marshall, J.W.; Parker, L.C.; Reynolds, J.R.; Seabourn, C.M.; Thornton, M.A.; Wilhite, A.W.; Ailor, W.H. III; Baker, R.L.; Blaylock, Lawrence Livermore National Lab., CA (USA); Interagency Nuclear Safety Review Panel (USA). Sep 1989. 112p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (INSRP–89-01-Vol.2). Order Number DE90003087. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report provides a brief overview of the various activities and decisions that were made by the Interagency Nuclear Safety Review Panel (INSRP) coordinators during the development of the Safety Evaluation Report for the Galileo mission. Each of the subpanels has generated a report describing its activities and the results of its portion of the Galileo evaluation. These reports should be reviewed for more indepth understanding of the subpanel activities. To bridge the gap between the subpanel reports and the Safety Evaluation Report, i.e., the assure continuity, this report summarizes the considerations and decisions made by the INSRP Coordinators at various points during the evaluation process. In particular, this report identifies the specific changes made to the Launch Accident Scenario Evaluation Program Version 2 (LASEP2) and EMERGE computer models used by the Department of Energy (DOE) in the development of Volumes II and III of the Galileo Final Safety Analysis Report and by INSRP in the development of the Safety Evaluation Report. In addition, this report documents decisions made concerning how to best present results obtained from the INSRP evaluation. 8 refs., 2 tabs.

2652 **Nuclear electric propulsion for near-term space missions.** Asbell-Clarke, J.E.; Houts, M.G.; Keaton, P.W. pp. 1363 of Engineering, construction, and operations in space; Proceedings of the Space '88 Conference, Albuquerque, NM, Aug. 29-31, 1988. Johnson, S.W.; Wetzel, J.P. American Society of Civil Engineers, New York, NY (US) (1988). (CONF-880843–: SPACE '88: engineering construction and operations in space, Albuquerque, NM (USA), 29-31 Aug 1988).

Potential uses of nuclear electric propulsion (NEP) for earth-orbit, lunar, and Martian missions are analyzed. NEP systems allow a higher payload mass fraction than chemical systems. NEP systems also allow a reduction in mission duration for interplanetary missions. The NEP reactor can be used to power the payload when the propulsion subsystem is shutdown. NEP systems may also reduce the total number of earth launches required to deliver a payload.

2653 (AD-A–210630/0/XAB) **Evaluation of fuel-cell technology for Coast Guard applications. Final report.** Barrett, T.J. Coast Guard, Washington, DC (USA). Office of Research and Development. Oct 1988. 20p. (USCG-D–08-89). Available from NTIS, PC A03/MF A01.

Recent proposals and the literature show promise of fuel cells being commercially available in the next decade. We searched the literature to determine the current state of fuel-cell technology, to determine if fuel cells can be used by the U.S. Coast Guard, and to make proposals for possible research and development efforts by the Coast Guard. Alkaline and phosphoric acid fuel cell technologies are now technically capable of full scale commercial production. Molten-carbonate and solid-oxide fuel-cell technologies should be commercially produced within the next decade. Phosphoric Acid Fuel Cell (PAFC) technology is the most promising for Coast Guard use. However, there is no operational need for fuel cells at present and high capital costs and low-energy prices make them economically noncompetitive. We suggest three areas of R&D to prepare for changes in operational needs or energy economics. They are: operation of a 200-kW PAFC cogeneration plant to gain fuel-cell experience; development of low-maintenance/high availability PAFC system for remote power; and development of fuel cells for or aircraft propulsion in case there is a strategic crisis in petroleum-distillate supplies.

2654 (CONF-891113–5) **Electrode development in monolithic solid oxide fuel cells.** Dees, D.W.; Balachandran, Uthamalingam; Dorris, S.E.; Heiberger, J.J.; McPheeters, C.C.; Picciolo, J.J. Argonne National Lab., IL (USA). 1989. 7p. Sponsored by U.S. Department of Defense. DOE Contract W-31109-ENG-38. From American Institute of Chemical Engineers annual meeting; San Francisco, CA (USA); 5-10 Nov 1989. Order Number DE90001910. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The interfacial resistance of thin three-layer ceramic solid oxide fuel cell composites was studied at 100°C using AC impedance techniques. The anode interfacial resistance was found to increase dramatically when the H_2O content decreased below 0.03 atm in a H_2/H_2O fuel system. A similar effect was also observed for the CO/CO_2 fuel system. Increases in the anode interfacial resistance were also observed in the presence of H_2S. Significant decreases in the anode interfacial resistance were accomplished by tailoring the electrode's microstructure.

2655 (CONF-8910107–2) **Interfacial effects in monolithic solid oxide fuel cells.** Dees, D.W.; Balachandran, U.; Dorris, S.E.; Heiberger, J.J.; McPheeters, C.C.; Picciolo, J.J. Argonne National Lab., IL (USA). [1989]. 6p. Sponsored by U.S. Department of Defense. ARPA4850. From Electrochemical Society fall meeting; Hollywood, FL (USA); 15-20 Oct 1989. Order Number DE90001914. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The interfacial resistance of thin three-layer ceramic solid oxide fuel cell composites was studied at 1000° using ac impedance techniques. The anode interfacial resistance was found to increase dramatically when the H_2O content decreased below 0.03 atm in a H_2/H_2O fuel system. Increases in the anode interfacial resistance were also observed in the presence of H_2S. Significant decreases in the anode interfacial resistance were accomplished by tailoring the electrode's microstructure. 4 refs., 4 figs.

2656 (CRIE-T–87066) **Development of high-efficiency molten carbonate fuel cell. Evaluation of stack performance and clarification of degradation mechanism at high fuel utilization.** Watanabe, Takao; Mugikura, Yoshihior; Izaki, Yoshiyuki; Matsuyama, Toshiya; Kasai, Hidekazu; Sato, Seiji. Central Research Inst. of Electric Power Industry, Komae, Tokyo (Japan). Energy and Environment Lab. Oct 1988. 38p. (In Japanese). Order Number DE89901266. Available from NTIS (US Sales Only), PC A03/MF A01.

The stack performance of a molten carbonate fuel cell operated under high fuel utilization and high efficiency was evaluated. A 1kW class stack composed of 10 cells was operated for 1,700 hours gradually increasing the fuel utilization rate. As a measure to increase the utilization rate, continuous power generation under the simulate conditions of anode recycle was conducted, and it went on without a hitch. When the supplied fuel flow amount was reduced at the first stage of operation and the utilization rate was raised to 70%; the performance of four cells at the center of the stack greatly changed, and the electric potential was decreased and reversed to minus in the end. As a result of the recall test by a single cell, it was found that the partial change in the anode structure at the starting made the gas diffusion in the electrode uneven, this brought about the increase of anode overvoltage, and that was the cause of a series of performance changes. The process is as follows: the consumption of absorbed H_2 due to the shortage of fuel gas, the transition of anode Ni to oxide reaction, the increase of overvoltage,

decomposition of CO_3 at anode, and the appearance of CO_2 and O_2 generated by the decomposition at the cathodic exhaust gas side. It is necessary to optimize the parts, the manufacture and the starting procedure. 4 refs., 21 figs., 5 tab.

2657 (DOE/MC/25009–2752) **Effects of coal-derived trace species on the performance of molten carbonate fuel cells: Topical report (Progress report No. 4).** Pigeaud, A. Energy Research Corp., Danbury, CT (USA). Jan 1989. 29p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-88MC25009. Order Number DE90002826. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The primary objective of this study is to assess the overall combined effect of coal-derived gas-phase trace contaminants. The species will be simultaneously present in fuel gas at concentrations near the single contaminant tolerance level found for the MCFC. The species will include, but are not limited to mercury, tin lead, selenium, arsenic, and zinc in the presence of ammonia (NH_3), hydrogen sulfide (H_2S) and halide (HCl). To accomplish this, the contractor will provide: (1) comprehensive reports of the data obtained and briefings presenting our current understanding of the interaction mechanisms and various products formed, (2) an updated list of MCFC tolerances for trace species when tested in combination in coal-gas mixtures of at least seven contaminants such as might exist in fuel from a typical entrained- or fluidized-bed gasifier, and (3) a mathematical model capable of predicting the effects of combinations of trace species on performance and endurance of the MCFC. 39 refs., 1 fig., 3 tabs.

2658 (EGG-EP–8581) **An approach for testing fuel-cell/battery hybrid power sources for bus applications.** EG and G Idaho, Inc., Idaho Falls, ID (USA); U.S. Fuel Cells, Inc. (USA). 25 May 1989. 48p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE90002090. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The principal objectives of this report are: to describe an approach and outline general procedures for safe operation and testing of fuel cell/battery hybrid power sources, to discuss likely criteria for evaluating the system performance and relative merits of such power sources in a transportation application, and to describe the expected configuration and operation of the specific power systems now under development for the Department of Energy (DOE) sponsored transit bus program. 7 figs., 2 tabs.

2659 (PNL-SA–17036) **Solid oxide fuel cells electrodes based on In_2O_3-$PRrO_{1.83}$-ZrO_2.** Bates, J.L.; Weber, W.J.; Griffin, C.W. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 17p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC06-76RL01830. (CONF-8910107–3: Electrochemical Society fall meeting, Hollywood, FL (USA), 15-20 Oct 1989). Order Number DE90002666. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Oxides based on In_2O_3-$PrO_{1.83}$-ZrO_2 and having high electrical conductivity were developed as cathode materials for solid oxide fuel cells (SOFCs). A ternary phase diagram developed at 1823 K relates the electrical, thermal and electrochemical properties to compositions and structures of the material. The bcc In_2O_3 solid solution containing ZrO_2 and PrO_2 exhibits the highest electrical conductivity. Two-phase fcc-bcc structures provide high electrical conductivity with mixed ionic-electronic conduction, thermal expansion characteristics and fabricability compatible with other SOFC materials. The oxides are thermally stable in air to 1473 K, but are easily reduced at 1273 K. Electrochemical testing of an fcc-bcc composition with an externally applied current showed some densification of interface and exsolution of In_2O_3 at the cathode-electrolyte interface. 11 figs., 10 figs.

3008 Miscellaneous Converters

2660 (AD-A–210232/5/XAB) **Electrothermal guns – a theoretical investigation of factors for optimal performance. Technical report.** Oberle, W. Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab. Jun 1989. 59p. (BRL-TR–2999). Available from NTIS, PC A04/MF A01.

The electrothermal (ET) gun or electrothermal accelerator is an advanced propulsion concept in which an electrically generated high pressure and temperature plasma interacts with a carefully chosen working fluid to produce the necessary gases to accelerate the projectile. In theory, the combustion process is completely controlled by the electrical power input used to generate and sustain the plasma. Constant breech pressure and resulting optimal velocity should be obtainable by tailoring the power input for a given working fluid. Selecting working fluids which result in low molecular weight gases reduces the energy expended in accelerating the gases. This report, using an appropriately modified interior ballistic code, investigates several aspects of the electrothermal gun process. Conditions required of the electrical input and working fluid necessary to achieve the ideal constant breech pressure and optimal velocity are considered. The sensitivity of ballistic performance and gas temperature for the electrothermal process is determined for perturbations in several factors felt to be critical to ET performance. Differences arising from using non-energetic (endothermic) or energetic (exothermic) working fluid are addressed. Results of the computer simulations indicate that an ET gun can out-perform conventional solid-propulsion technology. The simulations indicate that the electrical power input required to drive the constant breech pressure is feasible. One of the critical factors in ET gun performance is reproducible plasma/working-fluid interaction, impacting not only projectile velocity and pressure profiles, but more significantly, gas temperature.

2661 (AD-A–210826/4/XAB) **Three-dimensional modeling of heat transfer from slab floors. Final report.** Bahnfleth, W.P. Army Construction Engineering Research Lab., Champaign, IL (USA). Jul 1989. 213p. (CERL-TM-E–89/11). Available from NTIS, PC A10/MF A01.

Earth-coupled heat-transfer processes have been recognized in recent years as a potential source of significant energy savings in both conventional and earth-sheltered designs, Because of the complexity of the building/soil/atmosphere interaction, however, important aspects of earth-coupled heat transfer are not well understood. There is a particular lack of three-dimensional foundation heat-loss data. In this study, a detailed three-dimensional finite-difference model of a slab floor was used to generate 93 annual simulations in parametric groups focusing on effects of size and shape, soil properties, boundary conditions, climate, insulation, and building shadow. These results indicate that soil thermal conductivity, ground surface conditions, foundation design, and floor shape/size are essential elements of a general change in heat-transfer rate.

2662 (BRE-IP–10/89) **Building management systems: user experiences.** John, R.W.; Fargus, R.S.; Smith, G.P. Building Research Establishment, Watford (UK). Jun 1989. 4p. Order Number DE90722671. Available from NTIS (US Sales Only), PC A02/MF A01.

BRE has reviewed 42 building management system (bms) sites to assess users' reactions to their systems' performance. User experiences offer a valuable insight into the benefits and problems associated with bms. Lessons from the work can aid the selection, specification, installation and long-term operation of bms; and will be of interest to building managers and building services engineers. The work has illustrated: (1) the benefits attributed by users to the use of a bms, typically energy savings of between 10 and 20%, improved management (such as reduced maintenance/more efficient use of manpower), and an improvement in comfort; (2) the significant improvements that have occurred in the performance of bms

systems between those studied in 1984 and those studied during 1987; (3) the problem areas most commonly encountered by users, eg the man-machine interface; and (4) the importance of carefully selecting and specifying the bms to match the operating environment and, in particular, the skills of bms users. (author).

2663 (BRE-IP–11/89) **Space and hot water heating: energy-efficiency in large gas-fired systems.** Trim, M.J.B. Building Research Establishment, Watford (UK). Jun 1989. 4p. Order Number DE90722672. Available from NTIS (US Sales Only), PC A02/MF A01.

In many older, residential housing schemes, space and domestic hot water heating are provided by over-sized, gas fired heating plants. In such systems there is scope for improving operating performance, particularly to reduce energy use and plant maintenance. Drawing on a monitoring programme in sheltered housing, this paper describes for designers, installers and operators some simple energy-efficient measures that can be applied to the design of centralised heating plants for residential accommodation. (author).

2664 (CSTB-PC–661) **Preliminary study to a demonstration building climatic design program in the Ivory Coast.** Grelat, A. Centre Experimental de Recherches et d'Etudes du Batiment et de Travaux Publics, 75 - Paris (France). 1987. 319p. (In French). Order Number DE89908088. Available from NTIS (US Sales Only), PC A14/MF A01.

The two main objectives of this study are: the development of recommendations concerning the thermal design of inexpensive-type residential building in tropical climates (wet and dry), based on simulation results; the experimental study and the thermal optimization of a pilot climatic building estate (1000 housings) in Abidjan (Ivory Coast): thermal comfort, ventilation, building thermal behaviour. A sociological study on in-house occupation is also presented.

2665 (DOE/BP–1193) **Radon monitoring results from BPA's Residential Weatherization Program: Report No. 10.** US-DOE Bonneville Power Administration, Portland, OR (USA). Feb 1989. 33p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002855. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This Standard Review Plan (SRP) provides guidance to staff acting on rulemaking petitions to exempt from regulation radioactive waste determined to be below regulatory concern (BRC). The review plan is designed to ensure the quality and uniformity of staff reviews and to present a well-defined base for the staff's evaluation of BRC rulemaking petitions. The plan serves to improve the understanding of the staff's review by interested members of the public and the industry. It also provides information about the BRC rulemaking process to a wider audience. The two-step review consists of (1) an initial acceptance review to determine whether a petition for rulemaking complies with the requirements to 10 CFR Part 2 "Rules of Practice for Domestic Licensing Proceedings," section 2.802(c) "Petition for Rulemaking," combined with a regulatory and technical screening review for compliance with Commission policy contained in Appendix B to 10 CFR Part 2, "General Statement of Policy and Procedures Concerning Petitions Pursuant to §2.802 for Disposal of Radioactive Waste Streams Below Regulatory Concern;" and (2) a subsequent detailed regulatory and technical review for compliance with the aforementioned Commission policy. The SRP is primarily based on and follows the format of the Commission policy statement. Each individual SRP addresses the responsibilities of the reviewer, the matters that are reviewed, the Commission's regulations and acceptance criteria necessary for the review, how the review is accomplished, and the implementation requirements.

2666 (DOE/BP–1236) **Fan pressurization test results from the residential construction demonstration project: Cycle 1.** Harris, J. Bonneville Power Administration, Portland, OR (USA). 14 Apr 1989. 147p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002853. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

The Residential Construction Demonstration Project was designed to test innovative energy efficient construction techniques in electrically heated residential buildings. The first construction cycle of the program focused on innovative ventilation systems, air-tight construction and high R-value walls. The RCDP includes a data gathering and analysis component in order to evaluate the cost efficiency of the various innovations being tested. This report focuses on the data collected on the air sealing component of the project. The data gathering for the air tightening component of the project consisted of performing fan pressurization (blower door) tests on each house shortly after the home was constructed. This information was combined with information from a detailed site audit to evaluate the relative "tightness" of the homes and the probable causes of variations in performance. 14 figs., 3 tabs.

2667 (DOE/BP–1256) **Radon monitoring results from BPS's Residential Conservation Programs: Report No. 11.** US-DOE Bonneville Power Administration, Portland, OR (USA). Jul 1989. 35p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002854. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Listed on the following pages are the accumulated results of the Bonneville Power Administration regionwide Residential Conservation Programs radon monitoring received as of July 1, 1989. This data represents only those readings within the service areas of utilities (and the State of Washington, Department of Community Development) who participate in the Residential Weatherization, Super Good Cents, and Northwest Energy Code Programs. Several areas in the Pacific Northwest are excluded in this evaluation. In addition, the amount of results received is heavily weighted by the number of homes monitored through large utility conservation programs located in Western Oregon and Washington. Due to these limitations, we do not recommend that any conclusions be made on a statewide or regionwide basis. We have provided this regional and statewide data for illustrative purposes only. This report provides a summary of all the data collected for weatherized existing homes (WXN) and new homes built to model conservation standards (MCS) in the States of Oregon, Washington, Idaho, Montana, and Wyoming. Specific data is listed by US Geological Survey designated range and township locations. The specific data listed by range and township includes only those townships with a minimum of five random readings. This has been done to protect the privacy of those residences participating in the program.

2668 (DOE/BP–1273) **Northwest Residential Radon Standard: Volume 1, Project report.** Nuess, M. USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Resource Management; Washington State Energy Office, Olympia, WA (USA). Oct 1989. 87p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002851. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Recognizing that building codes are designed to protect the life, health, and safety of occupants and that the economics involved in reducing radon levels in an existing home versus incorporating preventative measures in new homes, BPA contracted with the Washington State Energy Office to develop the Northwest Residential Radon Standard. The Radon Standard would provide builders, local jurisdictions and homebuyers an appropriate set of actions which could be taken during house construction to minimize indoor radon levels. The project was intended to provide: Effective, workable, and affordable technical specifications for installation into new homes during initial construction to minimize radon entry, especially in areas of potentially high radon levels. This model radon standard would be available for adoption by all jurisdictions in the Pacific Northwest with code adoption authority, and A generic plan for implementing the model standard in any jurisdiction in the Pacific Northwest.

2669 (DOE/BP–1274) **Northwest residential radon standard: Volume 2, Comment letters.** Nuess, M. USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Resource Management; Washington State Energy Office, Olympia, WA (USA). Oct 1989. 59p. Sponsored by U.S. DOE Management & Administration. Order Number DE90002850. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

These are letters of comment to the Northwest residential radon standard. (JEF)

2670 (DOE/BP/11287–12) **The Hood River Story: How a conservation project was implemented: Volume 1, Final report.** Schoch, K. (ed.). Pacific Power and Light Co., Portland, OR (USA).

Sep 1987. 104p. Sponsored by U.S. DOE Bonneville Power Administration; U.S. DOE Environment Health & Safety. DOE Contract AC79-83BP11287. Order Number DE90002779. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This Project had two principal components. One facet was the actual weatherization – a process which lasted 2-1/2 years. The second facet is the research, evaluation, and data collection effort. This work began two years before the start of field activity, and will formally continue until 1988, three years after weatherization completion. Data collected throughout the project are a continuing resource for conservation planners and energy policy decision makers. This volume concentrates on the field weatherization process. In addition to documenting the basic details of what occurred, the varying perspectives of management, the community, the staff, and the contractors are presented. 67 refs., 3 figs.

2671 (DOE/CE/15407–T2) **Extended range tankless water heater: Quarterly report No. 2, July 20, 1989–October 19, 1989.** Harris, J.A. Harmony Thermal Co., Wichita, KS (USA). 30 Oct 1989. 5p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG01-89CE15407. Order Number DE90002561. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This is the second quarterly report for DOE/ERIP Project No. DE-FG01-89CE15407, Extended Range Tankless Water Heater. The objective of this project is to develop an innovative gasfired tankless water heater certified by AGA and ready for commercial sale. Relative to the planned timetable, we remain somewhat behind schedule at this point. According to the original timetable, we should be in the test phase for our engineering prototype. My estimate is that we are one to two months from that point at present. Part of the problem is that financial constraints demand that I continue to work part-time as an adjunct professor at Wichita State University. This takes time which could otherwise be spent on the project. Nevertheless, we continue to make significant progress, and the project is going well in that we have been successful with the tasks we have attempted thus far.

2672 (DOE/EIA–0321/1(87)) **Household energy consumption and expenditures, 1987: Part 1, National data.** USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use. 10 Oct 1989. 287p. Sponsored by U.S. DOE Management & Administration. Order Number DE90001588. Available from NTIS, PC A13/MF A01 - GPO - OSTI; GPO Dep.

Household Energy Consumption and Expenditures 1987, Part 1: National Data is the second publication in a series from the 1987 Residential Energy Consumption Survey (RECS). It is prepared by the Energy End Use Division (EEUD) of the Office of Energy Markets and End Use (EMEU), Energy Information Administration (EIA). The EIA collects and publishes comprehensive data on energy consumption in occupied housing units in the residential sector through the RECS. 15 figs., 50 tabs.

2673 (DOE/HWP–94) **Navy Radon Assessment and Mitigation Program progress report, September 1988–May 1989.** Wilson, D.L.; Dudney, C.S. Oak Ridge National Lab., TN (USA). Oct 1989. 223p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. (ORNL/M–993). Order Number DE90002910. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

The initial part of the prioritization phase of NAVRAMP has been completed. Through a competitive bidding process, a qualified vendor was selected to provide radon detectors and reports of the time-weighted average concentrations sampled. More than 22,800 radon detectors for placement in family housing units were shipped to 143 US naval facilities all over the world. Another 1956 detectors for placement in nonhousing structures were shipped to 206 facilities. One hundred eleven facilities received detectors for both housing and nonhousing structures. Facilities in tropical climates (e.g., Hawaii, Guam, the Philippine Islands, and Indonesia), were instructed to leave the detectors in place for about 3 months during the summer cooling season. All other facilities were instructed to leave the detectors in place for about a year. In addition to the detectors, the shipments included chain of custody letters, instruction packets, and detector placement data forms. To answer questions about the program and assist Base personnel in placing the detectors, a hot-line telephone number was established at the Analysas Corporation, Oak Ridge, Tennessee. Existing data bases obtained from the Navy are being updated. Data bases and associated data entry programs were developed to organize and manage the data that will become available as the detectors are placed and retrieved and as the measurement results are returned by the vendor. All official paper records of the project are being stored at Oak Ridge National Laboratory until they can be returned to the Navy. 4 refs., 7 tabs.

2674 (DTH-LV-MEDD–197) **Resource saving cassette building system for low energy houses.** Bolet, B.; Rasmussen, N.H.; Korsgaard, V. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varmeisolering. Dec 1988. 163p. (In Danish). Order Number DE90718990. Available from NTIS (US Sales Only), PC A08.

In this report a description of the development of a new building system for low-energy houses is given. Cassette elements have been developed, which, in different forms, can be used for both floor, walls and roof in a standard house. The elements have been tested in a prototype standard house - the test house at Tovesvej 30, Naerum. For the test house an air heating system with heat pump has been developed. Both heating and climate technical measurements have been carried out in the test house first while it was still uninhabited and then for 6 months during actual habitation. The results of the measurements show that the heat consumption has been about 30% higher than expected according to the theoretic calculations also when considering the special conditions for habitation and the solar and weather conditions. Some technical examinations concerning construction and heating have been carried out in the house, which prove that the house is extremely tight with hardly any cold bridges and that the thermal comfort in the house is good. The heat insulating properties of the building envelope have not lived up to the theoretical value, and the heat pump has also been less efficient than expected. The measurements have been carried out at the same time as further developments of the cassette elements and proposals for a 2. generation low-energy house have been made. The economy as a whole of a 2. generation house is expected to become better than that of an ordinary house of similar standard. (BN).

2675 (ETDE-mf–0718079) **Noise pollution abatement for heat pumps with internal combustion engines. Illustrated by the large-capacity gas-fueled heat pumps in domestic and commercial buildings.** Ministerium fuer Umwelt, Raumordnung und Landwirtschaft des Landes Nordrhein-Westfalen, Duesseldorf (Germany, F.R.). 1988. 108p. (In German). Order Number DE90718079. Available from NTIS (US Sales Only), PC A06/MF A01.

The brochure deals with questions on noise pollution abatement for heat pump plants with outputs between 200 and 1200 kW. It is intended to give purchasers and operators of heat pumps with internal combustion engine drive technically based information on how adverse effects on the environment by noise can be avoided. The brochure contains many measurements of noise emission from plants in operation and on noise propagation in buildings. These act as the basis for deriving and describing measures to reduce noise. The emission measurements were taken on 13 gas engine heat pumps, 5 gas engines and 3 refrigerant compressors. The latter were in electrical heat pumps. (BR).

2676 (ETDE-mf–0718199) **Experimental and theoretical investigation of passive use of solar energy on house facades.** Meyer, K. Kassel Univ. (Gesamthochschule) (Germany, F.R.). Fachbereich 15 - Maschinenbau. 30 Mar 1987. 176p. (In German). Order Number DE90718199. Available from NTIS (US Sales Only), PC A09/MF A01.

The aim of a research project was to examine the effect of solar radiation on selected solar wall designs. First the effect of wall design on the heat balance of the space inside was determined (single, glazed, insulated outside walls, heat pipe wall, theory, design built). Experimental investigations were carried out on models with different wall designs (model of building, temperature, speed of flow of outside air, solar radiation, inside space temperature, build-up of solar facades, measurement and control devices). The results of experiments are interpreted and the reproduceability of heat energy is dealt with. Differential equations for non-steady state heat

transport are given for the mathematical model, boundary conditions are named (types of heat transfer) and comparisons are made of measured and calculated results. Finally, different wall designs are judged regarding the saving of heat energy. (HWJ).

2677 (ETDE-mf–0722342) **Evaluation of the energy conservation program for the NMB bank offices.** Fugro Geotechniek BV, Arnhem (Netherlands). Oct 1988. 33p. (In (In Dutch)). (NOVEM–89-001). Order Number DE90722342.

The title project was carried out by the NMB bank (a Dutch bank) during the period 1983-1986. A description is given of the project history, the way in which the employees have been motivated, and the so-called 'Stookproef', ent to inform the personnel in the increase of degree days. Overall recommendations are given with regard to the energy conservation measures. Data acquisition and data processing of the energy consumption are discussed per office. Evaluation of the energy conservation data before and after the conservation measures was done in order to determine the accuracy of predicting energy conservation quantities. A positive, overall conclusion is given with regard to the possibility to predict results of energy conservation. Appendices and figures are published in a separate report. 16 figs., 3 tabs., 10 app.

2678 (ETDE-mf–0722344) **Evaluation of the energy conservation program for the NMB bank offices. Appendices and figures.** Fugro Geotechniek BV, Arnhem (Netherlands). Oct 1988. 85p. (In (In Dutch)). (NOVEM–89-002). Order Number DE90722344.

The title project was carried out by the NMB (a Dutch bank) during the period 1983-1986. For the actual report a separate abstract has been prepared. This report presents the numerical and compiled data. For 9 regions in the Netherlands data with regard to the different offices are presented: data on the construction, heating and electrical installations, energy balance, energy consumption and energy conservation, prices, investments, cost-benefit analysis and pay back periods.

2679 (GB–206) **Condensing boilers.** Department of Energy, London (UK). Energy Efficiency Office. Dec 1988. 8p. (Digest–339). Order Number DE90722716. Available from NTIS (US Sales Only), PC A02.

For both commercial and domestic use, condensing boilers represent a new generation of heating appliance. They can be used in most buildings, new and existing, large and small, with valuable savings in energy. Payback of the additional capital cost over conventional boilers usually occurs within one to five years. There are some cases where condensing boilers are not economically attractive, but these are the exception rather than the rule. This digest summarises selection, system design, installation, commissioning and maintenance and gives advice on economic appraisal. (author).

2680 (IBP-WB–11/87) **Are the external heat transfer coefficients correct?.** Erhorn, H.; Gertis, K.; Rath, J.; Szerman, M. Fraunhofer-Institut fuer Bauphysik, Stuttgart (Germany, F.R.). Bereich Waerme/Klima. 1987. 12p. (In German). Order Number DE90718064. Available from NTIS (US Sales Only), PC A03/MF A01.

For measurement on normally insulated external walls, one could prove that the external component surface temperatures were below the outside air temperature for more than half the measuring time. This phenomenon cannot be described by the K value, by definition. When relating the external heat transfer coefficient conditional on radiation to air temperatures, practical conditions cannot be satisfactorily simulated. For energy considerations, this simplification seems to be uncritical, however. One therefore wants to examine in future whether by revision of the heat transfer coefficient or the temperature boundary conditions to be selected, e.g. as a mixed value of the air and radiation temperature, one can find a means which will describe the real conditions more satisfactorily, on the one hand, and on the other hand will be as simple to handle as the equations used at present. (orig./HW).

2681 (IKE–7-9) **Computer-aided analysis of heating pipe networks.** Grammling, F. Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme. 1988. 141p. (In German). Order Number DE90718198. Available from NTIS (US Sales Only), PC A07/MF A01.

The most frequent problems in operating hot water heating systems are due directly or indirectly to the pipe network. The aim of research work explained in detail, was to develop a computer-aided process for heating pipe networks, with the aid of which, by measuring differential pressure and flow at just one central place in the pipe network, the actual hydraulic resistances can be determined. Previously known processes of pipe network analysis and computer-aided analysis of heating networks (model, method of analysis) and the computer program NETAN produced for it (construction, extent of measurements, fault-finding, simulation) are dealt with. Experimental testing follows this. (HWJ).

2682 (KTM/E-D–172) **Alternative development programme of the projects concerning the building management control.** Jauhiainen, J.; Hermuen, M.; Pyyskaenen, S. Kauppa- ja Teollisuusministerio, Helsinki (Finland). Energiaosasto. 1989. 67p. (In Finnish). Order Number DE90719328. Available from NTIS (US Sales Only), PC A04.

The concept 'ntelligent buildingis already a relatively established term in articles concerning the building area. The invasion of the applications within the building management control into the buildings is based more on the activity of the suppliers and salesmen than on the actual needs of the users. The automatization has happened almost secretly; the applications have not been considered as entireties and by taking into account their real meaning and the influence of other systems used in the building. The lack of clear structural and functional definitions and keeping to the traditional modes of acting in the electrical planning and realization are the main obstacles for the realization of the goal oriented and useful automation applications. In this report we have stated some general discriptions and definitions to specify the essential functions and data exchange as to the automation system, application and planning. Furthermore, there is stated a project model, which enables the sufficient flexibility in different building situations.

2683 (KTM/E-D–173) **Displacement ventilation - dimensioning of supply air flow.** Tapola, M.; Koivula, K. Kauppa- ja Teollisuusministerio, Helsinki (Finland). Energiaosasto. 1989. 81p. (In Finnish). Order Number DE90719324. Available from NTIS (US Sales Only), PC A05/MF A01.

A supply air flow dimensioning guide for spaces equipped with displacement ventilation systems has been developed in this research. The guide's basic data consists of the internal heat load properties of the ventilated space. The supply air flow provided by the guide will ensure vertical stratification of impurities which will cause air quality in the occupation zone to improve to the ratio of 3 if compared with the upper zone. The dimensioning quide is valid only for thermal displacement i.e. where impurities are warmer than the ambient air and the thermal stratification is clear. The dimensioning quide is based on the theoretical model where the displacement ventilation system is simulated by differential equations governing the rising plume generated by a thermal source. The model has been modified by empirical data obtained from the laboratory tests. In these tests, the behaviour of contaminant concentration stratification in displacement ventilation system was studied by alternating the supply air flow and the internal heat load properties of the space. Stratification was measured by tracer gas technique. The results of the laboratory findings have been fitted to the theoretical model and the standard error of the regression analysis is less than 20%. Field measurements have been carried out in several displacement ventilation systems. Experiments have shown that in the dimensioning of the displacement ventilation system a more precise knowledge of the basic data is required than in the dimensioning of the mixing ventilation system. The values obtained from the dimensioning quide and the results of the field measurements have been compared. The results were found to be similar in cases where the thermal stratification was clear.

2684 (KTM/E-D–174) **Design instructions for ventilation of day-care centres.** Leino, O.; Sallinen, V. Kauppa- ja Teollisuusministerio, Helsinki (Finland). Energiaosasto. 1989. 59p. (In Finnish). Order Number DE90719327. Available from NTIS (US Sales Only), PC A04/MF A01.

The paper studied the operation of the ventilation systems used in day-care centres in the City of Espoo. The costs and potential uses of different ventilation system arrangements were clarified by

experimental building. The object of the study was the Espoonlahti day-care centre, where the following ventilation system arrangements were tested: ventilation zones, use of transferred air between group rooms and boosting of ventilation in the gymnasium and in the kitchen. The results of the study produced two different reports. This report Design Instructions for Ventilation of Day-care Centresis meant to be a tool, in particular, for planning ventilation for day-care centres. The test results of the Espoonlahti day-care centre are presented in the report Experimental Building of Day-care Centres which is available from the Building Planning Department of the Technical Office of the City of Espoo.

2685 (LBL–20090) **Market share elasticities for fuel and technology choice in home heating and cooling.** Wood, D.J.; Ruderman, H.; McMahon, J.E. Lawrence Berkeley Lab., CA (USA). May 1989. 45p. Sponsored by U.S. DOE Conservation & Renewable Energy; Electric Power Research Institute. DOE Contract AC03-76SF00098. Order Number DE90002606. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A new technique for estimating own- and cross-elasticities of market share for fuel and technology choices in home heating and cooling is presented. We simulate changes in economic conditions and estimate elasticities by calculating predicted changes in fuel and technology market shares. Elasticities are found with respect to household income, equipment capital cost, and equipment capital cost, and equipment operating cost (including fuel price). The method is applied to a revised and extended version of a study by the Electric Power Research Institute (EPRI). Data for that study are drawn primarily from the 1975–1979 Annual Housing Surveys. Results are generally similar to previous studies, although our estimates of elasticities are somewhat lower. We feel the superior formulation of consumer choice and the currency of data in EPRI's work produce reliable estimates of market share elasticities. 18 refs., 1 fig., 6 tabs.

2686 (LBL–20332) **A review of assumptions and analysis in EPRI EA-3409: "Household appliance choice: Revision of REEPS [Residential End-use Energy Planning System] behavioral models".** Wood, D.J.; Ruderman, H.; McMahon, J.E. Lawrence Berkeley Lab., CA (USA). May 1989. 29p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002609. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper revises and extends EPRI report EA-3409, "Household Appliance Choice: Revision of REEPS Behavioral Models." That paper reported the results of an econometric study of major appliance choice in new residential construction. Errors appeared in two tables of that report. We offer revised versions of those tables, and a brief analysis of the consequences and significance of the errors. The present paper also proposes several possible extensions and re-specifications of the models examined by EPRI. Some of these are judged to be highly successful; they both satisfy economic intuition more completely than the original specification and produce a better quality fit to the dependent variable. We feel that inclusion of these modifications produces a more useful set of coefficients for economic modeling than the original specification. 8 refs., 15 tabs.

2687 (LBL–20333) **A study of aggregation bias in estimating the market for home heating and cooling equipment.** Wood, D.J.; Ruderman, H.; McMahon, J.E. Lawrence Berkeley Lab., CA (USA). May 1989. 33p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002608. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Econometricians frequently propose parametric models which are contingent on an underlying assumption of rational economic agents maximizing their utility. Accurate estimation of the parameters of these models depends on using data disaggregated to the level of the actual agents, usually individual consumers or firms. Using data at some other level of aggregation introduces bias into the inferences made from the data. Unfortunately, properly disaggregated data is often unavailable, or at least, much more costly to obtain than aggregate data. Research on consumer choice of home heating equipment has long depended on state-level cross-sectional data. Only recently have investigators been able to build up and successfully use data on consumer attributes and choices at the household level. A study estimated for the Electric Power Research Institute REEPS model is currently one of the best of these. This paper examines the degree of bias that would be introduced in that study if only average data across SMSAs or states were used at several points in the investigation. We examine the market shares and elasticities estimated from that model using only the mean values of the exogenous variables, and find severe errors to be possible. However, if the models were calibrated on only aggregate data originally, we find that proper treatment allows market shares and elasticities to be found with little error relative to the disaggregate models. 22 refs., 4 figs., 10 tabs.

2688 (LBL–20645) **Factors influencing soil as a source of indoor radon: Framework for assessing radon source potential.** Nazaroff, W.W.; Moed, B.A.; Sextro, R.G.; Revzan, K.L.; Nero, A.V. Lawrence Berkeley Lab., CA (USA). Jul 1989. 141p. Sponsored by U.S. DOE Conservation & Renewable Energy; U.S. DOE Energy Research; Environmental Protection Agency. DOE Contract AC03-76SF00098. DW89930801-01-0. Order Number DE90002607. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

In less than a decade the consensus concerning the nature and extent of the problem of radon in indoor air has been radically revised. Rather than simply a problem that arises due to molecular diffusion of radon from industrially contaminated building materials or fill materials, we now recognize that the vast majority of structures with elevated indoor concentrations are unexceptional in other regards. In most cases, radon enters predominantly via the substructure through convective flow augmented by molecular diffusion. The importance of soil as a source of indoor radon and the importance of the convective flow process for radon entry are seen in the considerable success of control measures directed at reversing the ordinary direction of flow of soil gas through pathways across the building substructure. We have described and discussed mechanisms of radon generation in soil and entry into the soil pore space, the physics of radon migration through soil, and the driving forces that generate pressure gradients in the soil surrounding buildings which lead to convective migration of radon into buildings. A mathematical description of radon concentration in the soil pore space has been developed that accounts for production and removal by radioactive decay and for diffusive and convective flow through the soil. We have reviewed the important soil and climatic variables that influence these processes and have attempted to evaluate their effects. 190 refs., 19 figs., 13 tabs.

2689 (LBL–27140) **Center for Building Science of the Applied Science Division annual report, FY 1988.** Cairns, E.J.; Rosenfeld, A.H. Lawrence Berkeley Lab., CA (USA). May 1989. 114p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. Order Number DE90002603. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The Center for Building Science consists of four programs in the Applied Science Division. It was established to provide an umbrella so that groups in different programs but with similar interests could combine to perform joint research, develop new research areas, share resources, and produce joint publications. As detailed within, potential savings for the US society from energy efficient buildings are enormous. But these savings can only be realized through an expanding federal R and D program that develops expertise in this new area. The Center for Building Science develops efficient new building components, computer models, data and information systems, and trains needed building scientists.

2690 (LBL–27534) **A versatile procedure for calculating heat transfer through windows.** Arasteh, D.K.; Reilly, M.S.; Rubin, M.D. Lawrence Berkeley Lab., CA (USA). May 1989. 25p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC03-76SF00098. (CONF-890609–6: ASHRAE annual meeting, Vancouver (Canada), 24-28 Jun 1989). Order Number DE90003126. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Advances in window technologies and the desire to standardize the reporting of standard window heat transfer indices have necessitated the development of a comprehensive analytical procedure for calculating heat transfer through windows. This paper shows how complete window heat transfer can be considered as the area-weighted sum of the three window component areas: the

center-of-glass area, the edge-of-glass area, and the frame area. Algorithms for calculating heat transfer through each of these areas and for combining these to calculate total window indices are presented. 36 refs., 5 figs., 6 tabs.

2691 (LBL–27692) **Monitoring and modeling for radon entry into basements: A status report for the small structures project.** Fisk, W.J.; Flexser, S.; Gadgil, A.J.; Holman, H.Y.; Modera, M.P.; Narasimhan, T.N.; Nuzum, T.; Revzan, K.L.; Sextro, R.G.; Smith, A.R. Lawrence Berkeley Lab., CA (USA). Sep 1989. 59p. Sponsored by U.S. DOE Conservation & Renewable Energy; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8909250–1: Radon contractors conference, Fort Collins, CO (USA), 20-22 Sep 1989). Order Number DE90002456. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The approach, status, and initial findings of a research project on radon transport through soil and entry into buildings are described. We have constructed two room-size precisely-fabricated basements at a site with relatively homogeneous soil. The structures have adjustable-size openings to the soil, are otherwise very air-tight, and are mechanically ventilated using a system that also controls the indoor-outdoor pressure difference. Numerous probes have been installed in the soil surrounding the structures to permit multipoint measurement of soil moisture content, soil temperature, permeability of soil to air, soil-gas pressure and radon concentration. State-of-the-art instrumentation is being installed for real-time monitoring of these parameters plus structure ventilation rate, indoor and entering soil-gas radon concentrations, and meteorologic parameters for a period of at least one year. Many of the factors that control or influence radon entry will be modified intentionally or by changes in environmental parameters during the course of the measurements. We have found it necessary to design and fabricate a new type of probe for more accurate measurements of soil permeability. We have also verified and improved procedures for more accurate, rapid, multipoint measurements of radon concentrations using a continuous radon monitor. Identical structures, with the same instrumentation, will be constructed at additional sites with difference soil characteristics and climates. Core samples of the soil from each site are analyzed to determine density, porosity, permeability, radium content, and radon emmanation coefficient. The research project also includes steady-state and transient numerical modeling efforts that complement the experimental research and that will use the experimental data for model validation. 32 refs., 12 figs., 5 tabs.

2692 (NCRP–103) **Control of radon in houses.** National Council on Radiation Protection and Measurements, Bethesda, MD (USA). 1 Sep 1989. 95p. Available from National Council on Radiation Protection and Measurements, 7910 Woodmont Ave., Suite 800, Bethesda, MD 20814.

This report, drafted by NCRP Scientific Committee 82 on Control of Radon in Houses, evaluates the techniques available to reduce radon and radon decay product concentrations. It is intended that this report would be useful to home owners, to individuals involved in marketing services to reduce radon and radon decay products in houses, and to the scientific community interested in control techniques for radon and radon decay products. Sections 1 and 2 of the report provide background information on the public health significance of indoor radon and on the sources and behavior of this radionuclide and its airborne decay products inside houses. The reader desiring information primarily on the control of radon may prefer to shift to Section 3 immediately after reading the Introduction. Included in Section 6 of the report are tables comparing the removal effectiveness and estimated costs of various control techniques, and a glossary of terms used in the report is provided.

2693 (ORNL–6487) **Investigation of radon entry and effectiveness of mitigation measures in seven houses in New Jersey.** Dudney, C.S.; Hubbard, L.M.; Matthews, T.G.; Socolow, R.H.; Hawthorne, A.R.; Gadsby, K.J.; Harrje, D.T.; Bohac, D.L.; Wilson, D.L. Oak Ridge National Lab., TN (USA). Aug 1989. 312p. Sponsored by U.S. DOE Energy Research; Environmental Protection Agency; New Jersey Department of Environmental Protection. DOE Contract AC05-84OR21400. Order Number DE89016676. Available from NTIS, PC A14/MF A01 - OSTI; GPO Dep.

This report describes the results from a year-long, intensive, instrumented study of radon entry processes and the effectiveness of radon mitigation measures in seven occupied New Jersey houses. All of the houses that were studied are basement houses that had elevated radon levels (i.e., greater than 400 and less than 7500 Bq m^{-3}) prior to the study. Various mitigation strategies were evaluated in the houses. The most successful strategy was depressurization of the soil beneath the concrete slab of the basement. To achieve subslab depressurization, one or more slab penetration points were selected for each house. The most important diagnostic measurement in selection of effective slab penetration points was testing of air flows between potential penetrations and points on the slab perimeter. Careful sealing of the wall to the slab was found to increase the effective zone of depressurization beneath the slab. 100 figs., 35 tabs.

2694 (PB–89-184428/XAB) **Effect of shading devices on residential energy use in Austin, Texas. Research report.** Pletzer, R.K.; Jones, J.W.; Hunn, B.D. Texas Univ., Austin, TX (USA). Center for Energy Studies. Jun 1988. 166p. (CONSERV-SOLAR-RR–5). Available from NTIS, PC A08/MF A01.

This report presents the results of an analytical study of the effect of shading devices on the annual heating, cooling, and total energy use, on summer peak electric demand, and on energy cost savings in single-family residences in Austin, Texas. With an hourly building energy-analysis model, savings were simulated for interior and exterior shading devices. No analysis of the costs of installing and operating these devices was made. Results are presented in terms of annual heating and cooling energy use and energy costs with each shading device in place as compared to baseline reference cases for three prototypical residences. The devices are ranked in terms of energy cost savings.

2695 (PB–89-213904/XAB) **Development of high-efficiency scroll compressors for air conditioners.** Hirano, T.; Hagimoto, K.; Matsumura, N.; Hori, M.; Takeda, K. Mitsubishi Heavy Industries Ltd., Tokyo (Japan). 1989. 6p. Available from NTIS, PC EE05.

Text in Japanese; Pub. in Mitsubishi Juko Giho, Vol. 26, No. 1, 66-71(1989).

As for recent heat-pump air conditioners, compressors are required to operate in a wide speed range by means of inverter drive and wide operating pressure range. From the points of high efficiency, high reliability, etc., scroll compressors have recently been used. To accomplish high efficiency, self-sealing mechanisms such as a tip seal and a swing-link mechanism, are very effective. The authors have developed high-efficiency hermetic scroll compressors with self-sealing mechanisms. The scroll compressors have capacity control function and can be driven by an inverter. In this report, the authors discribe the characteristics of global performance simulation that was developed for scroll-compressor analysis and experimental studies of the internal behavior of scroll compressors.

2696 (PB–89-224521/XAB) **Measurement of condensable vapor contribution to PM10 emissions.** Williamson, A.D.; Martin, R.S.; Harris, D.B. Southern Research Inst., Birmingham, AL (USA). 21 Jun 1985. 19p. Available from NTIS, PC A03/MF A01.

This paper describes the wood-stove dilution-sampling system, the results of laboratory characterization of the device, and field measurements of residential woodstove emissions. Under EPA contract, a stack dilution sampling system (SDSS) for field measurement of condensable emissions was designed and constructed . This train was used to measure condensable components of inhalable particulate matter at several sources. Also developed under EPA contract was the ESDSS, a reduced-scale dilution sampling system, which is mechanically suitable for fireplace and woodheater emissions measurement. Residential wood stoves emit large quantities of condensable as well as volatile and semi-volatile organic species. Thus, in order to adequately assess the effect of wood stove particulate emissions on the near-source environment, measurement techniques must be used that do not discriminate against the condensable emissions. Ambient particulate samplers collect the wood stove particulate matter after the plume-mixing dilution and cooling process.

2697 (PB–89-230619/XAB) **Conventional research house: Cooling characterization test results. Topical report, June-September 1987.** Leslie, N.P.; Hedrick, R.L.; Ghassan, P.G. Rutgers–the State Univ., Piscataway, NJ (USA). Dept. of Chemical

and Biochemical Engineering. Sep 1988. 104p. Available from NTIS, PC A06/MF A01.

Baseline cooling-characterization tests were conducted at GRI's Conventional Research House in Chicago, Illinois. A commercially available high efficiency electric air conditioner with two-speed condensing unit and A-coil in the furnace bonnet was used as the baseline cooling system. The low-speed capacity was 22,000 BTUH and the high-speed capacity was 31,000 BTUH. The baseline operating strategy was continuous cooling with a central two-stage thermostat setpoint of 75 F. The research house was moderately furnished to approximate conditions of occupancy for a family of three. Occupancy and appliance-simulation protocols were implemented in accordance with GRI's Research House Utilization Plan throughout the test period. A data-acquisition system monitored over 100 data channels on a minute-by-minute and hourly basis to characterize comfort, energy consumption, and dynamic response of the baseline system. The unit ran in the low-speed mode during 95% of all operating hours. The air-conditioning system maintained good comfort conditions throughout the summer in the upstairs zones, and acceptable humidity levels in the basement zone, which was somewhat cooler. The system energy-efficiency ratio was 10.6 in low-speed operation and 9.9 in high speed operation. Seasonal energy consumption was 1,133 kwh.

2698 (PNL–6984) **Summary of residential environmental issues and program consistency.** Baechler, M.C. Pacific Northwest Lab., Richland, WA (USA). May 1989. 40p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC06-76RL01830. Order Number DE90002738. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Northwest Power Planning Act authorizes the Bonneville Power Administration to acquire all necessary energy resources to serve Northwest utilities choosing to acquire power from the agency and to give conservation the highest priority in responding to the demand for electricity. To meet this mandate, the agency has established residential conservation programs for weatherizing existing homes, building new energy-efficient homes, and promoting energy-efficient appliances. Pacific Northwest Laboratory prepared this report to compare and contrast the environmental requirements and issues involving Bonneville's residential conservation programs. The key environmental concern confronting each of the programs with measures aimed at reducing air leakage rates in houses (both new and existing) is indoor air quality (IAQ). This report reviews the similarity and consistency of the programs' approach to IAQ, their impacts, program features, mitigation techniques, and new information about IAQ and other potential environmental issues confronting the programs. The information is intended for use in comparing and contrasting how environmental features mesh with other program features, checking consistency across programs and determining whether it makes sense for programs to be consistent, determining consistency between programs, and providing information to aid program planning in light of potential environmental issues and new information. 31 refs.

2699 (PNL-SA–17311) **Beyond the IDMY [International Daylighting Measurements Year]: A network instrument for low-cost data acquisition.** Michalsky, J.J.; Perez, R.; Harrison, L.; LeBaron, B.A. Pacific Northwest Lab., Richland, WA (USA). Jul 1989. 12p. Sponsored by U.S. DOE Conservation & Renewable Energy; New York State Energy Research and Development Authority. DOE Contract AC06-76RL01830. 724CONDCS85. (CONF-8910285–1: Symposium on daylighting and solar radiation measurement, Berlin (Germany, F.R.), 9-11 Oct 1989). Order Number DE90002722. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The International Daylighting Measurements Year (IDMY) network will acquire a data base to test models that convert solar irradiance data to daylight availability data for all skies and geometries. These models will subsequently be used to convert routine solar irradiance data to the desired daylight quantities. This paper briefly describes an instrument that provides for a substantial reduction in capital and maintenance costs associated with acquiring diffuse and total horizontal and direct normal irradiance. It outlines a simple procedure for correcting the silicon cell sensor to yield root-mean-square errors within 10 watts/meter^2 of first-class thermopile pyranometers and pyrheliometers. 3 refs., 5 figs., 3 tabs.

2700 (SERI/CP–254-3000) **Desiccant cooling and dehumidification opportunities for buildings workshop.** Penney, T.R. (comp.). Solar Energy Research Inst., Golden, CO (USA). Oct 1989. 211p. Sponsored by Electric Power Research Institute. DOE Contract AC02-83CH10093. (CONF-8606431–: Solar Energy Conservation Training Institute workshop on desiccant cooling and dehumidification opportunities for buildings, Chattanooga, TN (USA), 10-11 Jun 1986). Order Number DE89009490. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

Desiccant cooling and dehumidification technology is gaining acceptance as an option for air-conditioning buildings. Over the last few years, significant advances have been made in desiccant cooling and dehumidification in the private and public sectors. market penetration of desiccant systems in the past has been limited to unique applications. This workshop was an open forum for discussing these unique and potential applications. Workshop participants discussed the state of the art of desiccant materials, components, systems, and applications, both theoretically and experimentally. This document is a compilation of the papers presented in the workshop sessions.

2701 (STF–15A88028) **Simulation of energy consumption by taking thermal comfort into account.** Bryn, I. Selskapet for Industriell og Teknisk Forskning, Trondheim (Norway). Jul 1988. 13p. Order Number DE90719391. Available from NTIS (US Sales Only), PC A03/MF A01.

This program called COSIM is designed for simulation of thermal comfort and energy consumption in buildings with different heating and ventilation systems. The room model has two air zones, seven walls with or without heating and two windows. The analysis of thermal comfort is based on ISO standard 7730: Moderate thermal environments - Determination of the PMV and PPD indices and specification of the condidions for thermal comfort· The energy analysis part uses the results from the thermal comfort part to calculate energy consumption controlled by the operative temperature or the air temperature. 6 refs., 3 figs., (Author).

2702 (TNO-HMT–88-342) **Measuring heat flows in collective heating systems. Illusion or reality.** Brand, R.A.; Van Wolferen, J.; Mol, A. Hoofdgroep Maatschappelijke Technologie TNO, Apeldoorn (Netherlands). Dec 1988. 80p. (In (In Dutch)). (NOVEM–89-017). Order Number DE90722472.

General regulations for the Netherlands in the field of heat measurement and spreading of heating cost charges are not yet available. However, the number of different measuring methods as a means to spread the charges is large. A uniform measuring method appears to be necessary. By means of a calculation model the impacts of construction and installation of a collectively heated building as well as the attitude of the occupants on the heat flow distribution have been determined. The impact of heat flows between houses is limited for the distribution problem in case of similar consumer behavior. The applicability of different measuring methods has been determined for gallery apartments with vertical supply- and return pipes per radiator and for one-family dwellings with a central supply- and return connection. Recommendations are made for the appropriate distribution method with regard to heat charges in high-rise flats or low-rise buildings. A separate abstract has been prepared for the supplementary report with 30 appendices and 129 figures. 25 refs.

2703 (TNO-HMT–88-342/Suppl) **Measuring heat flows in collective heating systems. Appendices and figures.** Brand, R.A.; Van Wolferen, J.; Mol, A. Hoofdgroep Maatschappelijke Technologie TNO, Apeldoorn (Netherlands). Dec 1988. 165p. (In (In Dutch)). (NOVEM–89-018). Order Number DE90722473.

By means of a calculation model the impacts of construction and installation of a collectively heated building as well as the attitude of the occupants on the heat flow distribution have been determined in order to make an equitable spread of heating costs. A separate abstract has been prepared for the main report. Here the appendices and figures are presented with technical data on the apartment

buildings and the one-family dwellings and statistical data on the energy consumption in the different buildings. 129 figs., 30 apps.

2704 (TNO-HMT-R–88/253C) **Investigation of the indoor air quality of renovated houses in Bois-le-Duc, Netherlands.** Van der Wal, J.F.; Van Dongen, J.E.F.; Cornelissen, H.J.M.; Moons, A.M.M.; Steenlage, R. Fugro Geotechniek BV, Arnhem (Netherlands). Feb 1989. 232p. (In (In Dutch)). (NOVEM–89-039). Order Number DE90722455.

Indoor air pollution, ventilation, energy consumption and occupants comfort have been investigated for renovated one-family dwellings in the residential area 'De Slagen' in Bois-le-Duc, Netherlands. Airtight facades with ventilation facilities were realized during the renovation. Two balanced ventilation systems were applicated which differ in the air supply method. The concentrations of CO_2, total and respirable dust, formaldehyde and acrolein, carbon monoxide and nitrogen oxides, temperature and relative humidity were recorded for two whole days in occupied houses. Also the air current volumes of the mechanical ventilation systems and the air permeability of the houses were measured. The occupants' behavior during the measurements was kept in a diary by the occupants themselves. Relations between ventilation, indoor temperature and energy usage were looked for by means of an occupants survey. Data were collected on occupant acceptation of and experience with the system. 29 figs., 14 refs., 36 tabs., 11 apps.

2705 (VTT-TIED–829) **Efficiency measurements of ventilation.** Enbom, S. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Jan 1988. 45p. (In Finnish). Order Number DE90719348. Available from NTIS (US Sales Only), PC A03/MF A01.

This report presents the theoretical basics of the commonly used ventilation efficiency measuring methods, the reduction and the source methods. The usability of these both methods were evaluated by measurements done in the same conditions. Also methods to measure the concentration of tracer gases are presented.

2706 (VTT-TIED–982) **Heating energy flexibility of dwellings.** Haapalahti, P. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. 96p. (In Finnish). Order Number DE90719346. Available from NTIS (US Sales Only), PC A05/MF A01.

The problem area under study concens the heating of dwellings fluctuations in energy supply. The research has been restricted to dwellings only and those activities linked to energy production and transportation have been excluded. During energy shortage, homeowners are faced with two alternatives: to cut down their energy consumption or to use other forms of energy as substitutes for primary energy. In the case of a serious crisis regarding domestic fuel, wood in particular can be considered as a viable alternative. However, when considering present-day installations, any increase in use of wood as a fuel must be seen as limited. Thus the saving of energy in times of shortage is rendered still more important. Energy-savings is, of course, possible in terms of reduced comfort and quality factors in comparison to those preveiling under normal circumstances. For example, indoor temperatures can be lowered, ventilation diminished or the consumption of warm water deccreased. With respect to saving activities, the adjustability of heating and ventilation should be as efficient as possible. With regard to altering situations regarding energy prices, energy flexibility means, primarily, changing energy sources. Replacing an energy source is, however, a quite an expensive operation and economic dependence on the chosen system is considerable.Energy flexibility, particularly in the choice of main heating system, is easiest to achieve during new building phases and can be improved by recourse to various main solutions such as, for instance, the construction of fireplace. Mechanical incoming and exhaust air system can be chosen for direct electrical heating for a ventilation system. The control of the indoor temperature and ventilation of each separate room can be developed in all heating systems.

2707 (VTT-TIED–1028) **Evaluation of the thermal performance of the building envelope of existing buildings.** Kauppi, A. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. 124p. (In Finnish). Order Number DE90719347. Available from NTIS (US Sales Only), PC A06/MF A01.

Defects in thermal insulation and air tightness - usually called thermal defects - in the external envelope of our buildings lead to many kinds of inconveniences, like low temperatures on structures, draught, moisture damages and to some degree additional consumption of energy too. In order to find proper and the best possible repair methods, we first have to find out, what is the reason for different inconveniences. The main problem is often to find suitable methods and equipment to evaluate the thermal condition in practice. At first a brief literature study has been carried out as well as researchers' own experiences on the most usual thermal faults and defects in buildings have been listed. When the thermal consition is evaluated, we should, in order to optimize available resources, search for defects in places typical for each structure. Further the study clarifies, which kind of evaluation methods exist for the investigation of thermal condition and their usability. Available methods may vary from the simplest, like senses, to quite well developed methods like thermography etc. The project also comprised laboratory and field tests, by means of which the accuracy and suitability for practice of different measuring and evaluating methods were studied. The results of these tests show that there are differences between equipment and methods employed. Methods, equipment and combinations of equipment for evaluation are on the basis of the research proposed to be dealt in three different levels. Whichever of these levels is to be used, depends primarily on the aims and level of requirements we set to the results of evaluation. The level of evaluation method also depends essentially on available methods and equipment as well as the ability of the evaluating person to take advantage of these methods.

2708 **A thermally insulating vacuum window.** Garrison, J.D. (Physics Dept., San Diego State Univ., San Diego, CA (US)). pp. 544 of Solar engineering - 1989. Fanney, A.H.; Lund, K.O. American Society of Mechanical Engineers, New York, NY (1989). (CONF-890436–: 11. annual American Society of Mechanical Engineers solar energy conference, San Diego, CA (USA), 2-5 Apr 1989).

Much of the energy transfer between the inside of buildings and the outside environment is through the windows. Small prototypes of a relatively inexpensive thermally insulating vacuum window, which can reduce this energy transfer, have been fabricated and tested in the laboratory. This window is formed from two glass sheets, which are shaped to withstand the force from atmospheric pressure when the space between the glass sheets is evacuated. One or both of the inside surfaces of the two glass sheets are coated with an infrared reflecting coating to reduce radiative heat transfer. This vacuum window has high transmission of visible light. Distortion of the light makes it less suitable for viewing. The two glass sheets are shaped at a temperature somewhat above 800 C. They are sealed together by applying pressure around their outside edges and at internal points of contact, of very limited area, at a temperature near 700 C. Heat transfer calculations for this window have been performed.

2709 (CONF-890790–3) **Opportunities and prospects for Maglev in North America.** Eastham, T.R.; Coffey, H.T. Argonne National Lab., IL (USA). [1989]. 5p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From 5. world conference on transport research; Yokohama (Japan); 10-14 Jul 1989. Order Number DE90002190. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

As a result of early research in many countries, including the USA and Canada, and developments particularly in the Federal Republic of Germany and in Japan, the technologies of magnetic suspension and linear electric drives have matured to the stage at which low-speed systems are operational and high-speed systems have reached prototype test and demonstration. Maglev is now recognized as a realistic option for the 1990s and is being assessed in parallel with high-speed rail service in many corridor studies. Maglev is becoming available at a time when both road and air congestion is threatening the mobility that North America has come to expect. The fast, clean, energy-efficient characteristics should allow Maglev systems to contribute to the solution of impending transportation problems. This paper reviews the opportunities and prospects for the implementation of Maglev in North America. 12 refs., 1 fig., 1 tab.

2710 (NASA-CR–185163) **The Gevaltig: An inertial fusion powered manned spacecraft design for outer solar system missions.** Murray, K.A. Rockwell International Corp., Canoga Park, CA (USA). Energy Technology Engineering Center. Oct 1989. 44p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC03-76SF00700. (ETEC–89-7). Order Number DE90002624. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Gevaltig is an inertial fusion powered rocket engine capable of manned missions to other planets with round trip mission times as low as 100 days. The Gevaltig design was previously described for a mission to Mars. This effort defines the spacecraft components in terms of mass and presents a mission analysis for a manned trip to Titan, a moon of Saturn. The Gevaltig component masses are provided as a function of fuel pellet ignition frequency. These variable mass components include the fuel tanks, radiators, structure and EM pumps. Fixed mass components include the drivers, coil, coil shield, power processing system, payload, crew shield and laser mirrors. A 6 MW nuclear reactor is included in the design for startup purposes. Various combinations of thrust, mission duration and specific impulse were evaluated to determine a reasonable mission scenario for the Titan mission. The mission analysis yielded several viable mission scenarios, with round trip durations of 370 to 500 days and initial (launch) masses from lunar orbit of 2500 to 20,000 metric tons. 15 refs., 13 figs., 14 tabs.

2711 (PB–89-211072/XAB) **Revised manual for planning, designing, and operating transitway facilities in Texas. Research report, September 1983-August 1988 (Final).** Mounce, J.M.; Hawkins, H.G.; Stokes, R.W.; Payne, H.S. Texas A and M Univ., College Station, TX (USA). Texas Transportation Inst. Aug 1988. 197p. (TTI–2-10-84-339-14). Available from NTIS, PC A09/MF A01.

See also PB–87-168597.

Transitways are defined as exclusive, physically separated, access-controlled, high-occupancy vehicle priority treatment facilities which are typically located within existing freeway right(s)-of-way. Transitways are sometimes referred to as busways, high-occupancy vehicle (HOV) lanes, or authorized vehicle lanes (AVLs). The revised manual is divided into two parts: (1) Transitway mainlanes and connections; and (2) Transitway support facilities. Each of these parts addresses transitway planning, design, and operational considerations. Information presented within this transitway manual should promote effective planning, uniformity of design, and operational efficiency for transitway facilities in Texas.

2712 (PB–89-215479/XAB) **Urban Transportation Abstracts. Volume 7, 1988. Report for September 1988-February 1989.** Urban Mass Transportation Research Information Service, Washington, DC (USA). Apr 1989. 183p. (UMTA-DC–06-0610-88). Available from NTIS, PC A09/MF A01.

See also PB–89-170237. Library of Congress catalog card No. 83-640066.

Urban Transportation Abstracts is an annual publication that features abstracts and research project summaries on planning, designing, financing, constructing, operating, maintaining, managing, and marketing all modes of public transit. Some of these modes are advanced guideway systems, buses, carpools, commuter services, elderly and handicapped transport, heavy rail transit, light rail transit, paratransit, rapid transit, streetcars, taxicabs, trolley buses, and vanpools. Each issue is divided into five sections: (a) abstracts of reports and journal articles, (b) summaries of ongoing research, (c) a source index, (d) an author index, and (e) a subject index. This issue contains 712 abstracts of research reports, journal articles, and other information sources, and 105 summaries of ongoing research. Referenced documents come from both U.S. and foreign sources. The material is arranged according to the UMTRIS classification scheme; that is, abstracts and summaries are grouped by subject area, and within one subject area they are listed in ascending numerical order.

2713 (PB–89-215487/XAB) **HRIS (Highway Research Information Service) Abstracts. Volume 21, Number 4 - Winter 1988.** National Research Council, Washington, DC (USA). Transportation Research Board. 1988. 557p. Available from NTIS, PC A24/MF A01.

See also PB–89-170377. Library of Congress catalog card no. 75-642521.

HRIS Abstracts is a quarterly publication that provides information about highway and nonrail mass-transit research. It is compiled from computer records of the Highway Research Information Services (HRIS), an important subfile of the Transportation Research Information Services (TRIS) data base. The issue consists of four sections: Abstracts of research reports; Source Index listing names and addresses of corporate authors; Author Index; Retrieval Term Index listing subject terms for the HRIS Subject Terms List.

2714 (PB–89-218036/XAB) **Understanding the dynamics of innovation in urban transit. Final report on Phase 2.** Adler, S. Portland State Univ., OR (USA). Center for Transit Research and Management Development. Jun 1986. 86p. Available from NTIS, PC A05/MF A01.

See also PB–89-218028.

Urban transit is the major U.S. example of a once private industry that failed and was taken over by the public sector. Recent re-emergence of the private sector raises a number of issues and poses important policy questions. This report develops a conceptual model that explains the recent history of transit policy and outlines likely paths of transit service and institutional innovation. The model has 3 components: political and economic roles of transport facilities in the land-development process; nature of the political process through which transit became a public-sector activity; and politics of an industry whose prospects are the joint product of national, state, and local government activities. Each model element is explained, and their individual and collective implications for understanding recent policy history and likely future service and institutional changes are discussed. The report discusses the basic feature of the metropolitan development process, competition to maintain and attract capital investments.

2715 (PB–89-870885/XAB) **Hazardous-materials transportation. September 1982-September 1989 (Citations from the COMPENDEX data base). Report for September 1982-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 84p. Available from NTISPC N01/MF N01.

Supersedes PB–88-868781.

This bibliography contains citations concerning the transportation of hazardous chemicals, gases, explosives, and spent nuclear fuel. Liquefied natural gas transportation is emphasized. Tanker ships, containers, and pipelines for these materials are discussed along with truck, rail, air, and submarine transportation. Safety programs and routing information are presented. Hazards specific to arctic shipping are included. (This updated bibliography contains 164 citations, 24 of which are new entries to the previous edition.)

2716 (AD-A–210466/9/XAB) **Installation-Restoration Program Preliminary Assessment Kalakaket Creek Radio Relay Station, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 89p. Available from NTIS, PC A05/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation-Restoration Program (IRP) Preliminary Assessment of Kalakaket Creek Radio Relay Station (RRS), Alaska. DoD policy is to identify and fully evaluate suspected problems associated with past hazardous-material disposal sites on DoD facilities, control the migration of hazardous-contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. The major operations of the installation that used and disposed of hazardous materials/hazardous wastes (HM/HW) included vehicle maintenance; power production; petroleum, oils, and lubricants (POL) management; and management of batteries, electrical equipment, and paints. Small quantities of waste transformer fluid containing polychlorinated biphenyls (PCBs), lube oils, PD-680 solvent, synthetic oil, transmission fluid, motor gasoline, lead-acid batteries, fuel oil, aviation gasoline, diesel fuel, ethylene glycol, trichloroethane, paints, strippers, and thinners were generated by these activities. Asbestos was also used as a construction material

at the facility. At the time of the site visit, no evidence of contamination was visible at the RRS. However, as it was a common practice at similar facilities to bury drums and waste liquids, a landfill may exist in the vicinity of the RRS. In addition, asbestos was observed within the buildings at the RRS.

2717 (AD-A–210467/7/XAB) **Installation-Restoration Program Preliminary Assessment Bethel Radio Relay Station, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 130p. Available from NTIS, PC A07/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation Restoration Program (IRP) Preliminary Assessment of Bethel Radio Relay Station (RRS), Alaska. DoD policy is to identify and fully evaluate suspected problems associated with past hazardous material disposal sites on DoD facilities, control the migration of hazardous-contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. Installation operations involved the use and disposal of materials and wastes that were subsequently categorized as hazardous. The major operations of the installation that used and disposed of HM/HW included radio relay, vehicle maintenance, and field maintenance fluids, and polychlorinated biphenyls (PCBs) were generated by these activities. The common practice at similar facilities was to bury these materials in a landfill, however, a landfill was not identified at Bethel RRS during the site visit. Asbestos, used as a construction material, was observed throughout a number of buildings at the RRS. Information obtained through six interviews and field observations indicates that HM/HW have been disposed of on the Bethel RRS property in the past at nine sites. Each of these sites is potentially contaminated with HM/HW and exhibit the potential for contaminant migration to groundwater and surface water.

2718 (AD-A–210468/5/XAB) **Installation-Restoration Program Preliminary Assessment, Naknek Recreational Camps, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 91p. Available from NTIS, PC A05/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation-Restoration Program (IRP) Preliminary Assessment of Naknek Recreational Camps, Alaska, DoD policy is to identify and fully evaluate suspected problems associated with past hazardous-material disposal sites on DoD facilities, control the migration of hazardous contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. Past installation operations involved the use and disposal of materials and wastes that were subsequently categorized as hazardous. The major operations of Naknek Camp I and Camp II did not use or dispose of HM/HW; however, these camps were used by the Air Force as dump areas and landfills. Waste oils, fuels, and polychlorinated biphenyls (PCBs) were among the wastes disposed of during these dumping activities. Information obtained through interviews, records, and field observations resulted in the identification of three sites that are potentially contaminated with HM/HW. At each of the identified sites, the potential exists for contamination of surface water, soils, and/or ground water and subsequent contaminant migration.

2719 (AD-A–210469/3/XAB) **Installation-Restoration Program Preliminary Assessment, Granite Mountain Radio Relay Station, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 88p. Available from NTIS, PC A05/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation-Restoration Program (IRP) Preliminary Assessment of Granite Mountain Radio Relay Station (RRS), Alaska; DoD policy is to identify and fully evaluate suspected problems associated with past hazardous material disposal sites on DoD facilities, control the migration of hazardous contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. The major operations of the installation that used and diposed of hazardous materials/hazardous waste (HM/HW) included management of fuel and electrical equipment, maintenance of the facility and vehicles, and use of asbestos as a construction material. Based on information obtained through interviews with Air Force personnel and review of installation records, hazardous materials were used at Granite Mountain RRS while the facility was in operation. Although no evidence of contamination was visible at the time of the site visit, it was common practice at similar facilities to bury drums and waste liquids and these wastes may be present in the solid-waste landfill at the RRS. In addition, asbestos may remain within the buildings.

2720 (AD-A–210470/1/XAB) **Installation-Restoration Program Preliminary Assessment, Gold King Creek Radio Relay Station, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 87p. Available from NTIS, PC A05/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation-Restoration Program (IRP) Preliminary Assessment of the Gold King Creek Radio Relay Station (RRS), Alaska; DoD policy is to identify and fully evaluate suspected problems associated with past hazardous-material disposal sites on DoD facilities, control the migration of hazardous contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. The major operations of the installation that used and disposed of HM/HW included management of diesel fuel used to power the generators, management of lead-acid and nickel-cadmium batteries used to store electricity, handling of electrical equipment possibly containing polychlorinated biphenyls (PCBs), and use of asbestos as a construction material. Small quantities of hazardous materials were used at Gold King Creek RRS while the facility was in operation. The underground diesel tanks at the facility were drained and abandoned in place and the electrical equipment was removed from the site. No evidence of contamination was visible at the time of the site visit. However, asbestos may remain within the radio relay building, and information obtained through interviews and records resulted in the identification of one site at Gold King Creek RRS that is potentially contaminated with HM/HW.

2721 (AD-A–210471/9/XAB) **Installation-Restoration Program Preliminary Assessment, Bear Creek Radio Relay Station, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 68p. Available from NTIS, PC A04/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation-Restoration Program (IRP) Preliminary Assessment of Bear Creek Relay Station (RRS) Alaska; DoD policy is to identify and fully evaluate suspected problems associated with past hazardous-material disposal sites on DoD facilities, control the migration of hazardous contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. The major operations of the installation that used and disposed of hazardous materials/hazardous wastes (HM/HW) included automobile maintenance, storage of petroleum products, and communications. Types of hazardous wastes generated at the facility include residual fuels and oils, lead-acid storage batteries, and equipment containing polychlorinated biphenyls (PCBs). Asbestos was also used as a construction material at the facility. After the facility closed PCB-contaminated soil and equipment were removed from the site, as were batteries and fuels. No evidence of contamination was visible at the time of the site visit. However, as it was a common practice at similar facilities to bury drums and waste liquids, these wastes may present at the disposal site at the RRS. Liquid wastes may have also been disposed of into the floor drains of the vehicle maintenance shop; these drains may be connected to a dry well. In addition, asbestos may remain within the buildings.

2722 (AD-A–210472/7/XAB) **Installation-Restoration Program Preliminary Assessment, Canyon Creek Radio Relay Station, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 70p. Available from NTIS, PC A04/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation-Restoration Program (IRP) Preliminary Assessment of the Canyon Creek Radio Relay Station (RRS), Alaska, DoD policy is to identify and fully evaluate suspected problems associated with past hazardous-material disposal sites on DoD facilities, control the migration of hazardous contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. Past installation operations involved the use and disposal of materials and wastes that were subsequently categorized as hazardous. The major operations of the installation that used and disposed of hazardous materials/hazardous wastes (HM/HW) included management

of diesel fuel used to power the generators, management of lead-acid and nickel-cadmium batteries, handling of electrical equipment possibly containing polychlorinated biphenyls (PCBs), and use of asbestos as a construction material. Information obtained through interviews, records, and field observations resulted in the identification of no sites at Canyon Creek RRS that are potentially contaminated with HM/HW. The underground diesel tanks were drained and properly abandoned and the batteries and electrical equipment were removed from the site. No evidence of contamination was visible at the time of the site visit. However, asbestos may remain within the radio relay building.

2723 (AD-A-210473/5/XAB) **Installation-Restoration Program Preliminary Assessment, Big Mountain Radio Relay Station, Alaska.** Hazardous Materials Technical Center, Rockville, MD (USA). Apr 1989. 83p. Available from NTIS, PC A05/MF A01.

The Hazardous Materials Technical Center (HMTC) was retained in January 1988 to conduct the Installation-Restoration Program (IRP) Preliminary Assessment of Big Mountain Radio Relay Station (RRS), Alaska. DoD policy is to identify and fully evaluate suspected problems associated with past hazardous-material disposal sites on DoD facilities, control the migration of hazardous contamination from such facilities, and control hazards to health and welfare that may have resulted from these past operations. The major operations of the installation that used and disposed of hazardous materials/hazardous waste (HM/HW) included management of diesel fuel used to power the generators, management of lead-acid and nickel-cadmium batteries used to store electricity, use of asbestos as a construction material, and handling of electrical equipment possibly containing polychlorinated biphenyls (PCBs). Based on information obtained through interviews with Air Force personnel and installation records, small quantities of hazardous materials were used at the RRS while the facility was in operation. It is unknown if the above-ground fuel tanks at the facility were drained and properly abandoned in place. The electrical equipment has not been removed from the site. At the time of the site visit, no evidence of contamination was visible at the RRS, However, as it was common practice at similar facilities to bury drums and waste liquids, a landfill may exist in the vicinity of the RRS.

2724 (DOE/BP/35571-1) **Optimal real-time pump and irrigation scheduling for center-pivot sprinkler systems.** Chou, F.N.F.; Labadier, J.W.; Heermann, D.F.; Buchleiter, G.W. Colorado State Univ., Fort Collins, CO (USA). Sep 1988. 171p. Sponsored by U.S. Department of Agriculture; U.S. DOE Management & Administration. DOE Contract AI79-87BP35571. Order Number DE90002800. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Center-pivot farms located on major river systems generally pump water from the surface source and convey it through a pressurized pipe network to the pivots. Booster pump stations may be placed in the system to add necessary head for water delivery to the pivots. Attempts to improve pump and irrigation scheduling must make sure that soil moisture levels are maintained within desired limits for favorable crop growth. A soil water balance model and a branching pipe network hydraulics analysis model are therefore necessary for simulating system behavior and estimating pumping costs. The objective of this study is to develop a dynamic irrigation scheduling algorithm for achieving minimum pumping cost over a billing period, object to maintaining optimum crop production and adequate system delivery pressures. After investigation of several optimization methods, dynamic programming successive approximations (DPSA) is selected as the best approach to solving this problem. Feasibility in scheduling pivot operations and maintaining favorable soil water levels is always guaranteed during the DPSA analysis. Discrete dynamic programming is also applied for selecting pump combinations in each pump station with consideration of hydraulic interaction between stations to minimize pumping cost during each scheduling period for a specified irrigation strategy. A modified objective function is adopted for commensurating objectives of minimizing energy consumption and peak power demand. A comprehensive, generalized irrigation scheduling algorithm is developed to effectively integrate optimal irrigation decision with optimal pump selection. 116 refs.

2725 (DOE/CE/15407-T1) **Extended range tankless water heater: Quarterly report, April 19-July 19, 1989.** Harris, J.A. Harmony Thermal Co., Wichita, KS (USA). 26 Jul 1989. 9p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG01-89CE15407. Order Number DE89016440. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This is the first quarterly report for the Extended Range Tankless Water Heater. The objective of this project is to develop an innovative gas-fired tankless water heater certified by AGA and ready for commercial sale. 8 figs.

2726 (EEO-ED-241/224) **Flux degassing of aluminium swarf and dross. Energy Efficiency Office; British Steel Corp., Rotherham (UK). Swinden Labs. Jan 1989. 38p. Order Number DE90718808.

Energy Efficiency Demonstration Scheme report for the Energy Technology Support Unit (ETSU), Harwell (GB).

A significant proportion of scrap produced in aluminium foundries consists of swarf, clippings and dross. These arisings, which may represent 10% of the weight of finished castings, are traditionally toll refined for secondary melting or sold. The extra energy required for melting and remelting this material compared with remelting bulk scrap in the foundry amounts to a national energy expenditure of approximately 7.5×10^5 GJ/annum at current production levels. Following the development and successful application of a flux injection process to remove simultaneously gas and inclusions from foundry melts, the technique has been applied to the cleaning and degassing of swarf remelted in-house. In-house processing offers advantages in that only one melting operation is involved in producing liquid metal, and yields obtainable are significantly higher than those normally produced by toll refining. Successful feasibility trials were undertaken in small indirectly-fired furnaces (basin tilting furnaces) at three foundries to assess the potential for the flux degassing of swarf, clippings and dross. The feasibility trials indicated that yields approaching 90% could be achieved for the melting of swarf, clippings and skimmings and that clean metal could be produced of castable quality. The process was generally environmentally acceptable, and easily incorporated into routine foundry practice. (author).

2727 (EGG-M-36387) **Field testing of a ceramic heat exchanger for heat recovery application.** Sohal, M.S. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 29p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570;FC07-81ID12170. (CONF-880724-29: 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference, Houston, TX (USA), 24-27 Jul 1988). Order Number DE90002082. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

AiResearch Company, Torrance, California, developed a 5 MMBtu/hr ceramic-metallic hybrid High Temperature Burner-Duct-Recuperator (HTBDR) system to recover energy from hot (up to 2500°F), dirty, and corrosive glue gas streams and preheat combustion air up to 2000°F. To reduce the cost and size of the ceramic recuperator, ceramic tubes with internal cruciform baffles were developed. The HTBDR system was tested on a 20 MMBtu/hr rotary forging furnace for about 2000 hours. To facilitate tube replacements, final design configuration uses horizontally mounted tubes. A maximum air preheat temperature of about 1916°F was achieved with a flue gas temperature of 2122°F. This represents fuel savings of about 30 to 50 percent (depending upon the amount of excess air) compared with an unrecuperated furnace. The overall design and operation of the recuperator proved to be successful up to the time of material failure. X-ray diffraction of some failed components indicated that there was some residual Silicon in the interior regions and complete nitriding did not occur during the fabrication process. Degradation of failed components was probably caused by oxidation of residual Silicon and by the stresses caused due to different coefficient of thermal expansion of various compounds during thermal cycling. A combination of severe and numerous thermal cycling coupled with incomplete nitriding was the most likely cause of material failure. 22 refs., 12 figs., 4 tabs.

2728 (EGG-M–89322) **Membrane applications in the food industry: Survey and barriers.** Leeper, S.A.; Mohr, C.M.; Engelgau, D.E.; Charboneau, B.L. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 11p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. (CONF-8910272–1: 7. annual membrane technology/planning conference, Cambridge, MA (USA), 17-19 Oct 1989). Order Number DE90002042. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Idaho National Engineering Laboratory (INEL), with the support and assistance of the US Department of Energy, Office of Industrial Programs (DOE-OIP), conducted a comprehensive assessment of membrane applications in the food industry. In the course of preparing the assessment, over 70 existing, developing, and potential membrane technology applications in the food industry were identified. In addition, barriers to expanded use of membrane technology in the food industry were identified for the purpose of defining future DOE-OIP research directions. In this paper, commercial, developing, and conceptual membrane applications in the food industry are briefly summarized and barriers to expanded use of membrane technology in the food industry are identified and discussed. 2 refs., 9 tabs.

2729 (ETDE-mf–0717921) **Desulfurization of industrial gaseous effluents. Final report.** Onken, U. Dortmund Univ. (Germany, F.R.). Lehrstuhl fuer Technische Chemie B. [1989]. 71p. (In German). KZ 01 VQ 163. Order Number DE90717921. Available from NTIS (US Sales Only), PC A04/MF A01.

The method worked out here in detail is based on the formation of CuS by introducing H_2S-containing gases into an aqueous $CuSO_4$ solution. The metal sulfide is oxidized into sulfate by the thiobacillus ferrooxidans microorganism under aerobic conditions. Sulfuric acid is developed as a final product. It has proved to be necessary to carry out the CuS precipitation and the bacterial oxidation in separate reactors. Starting out from an H_2S concentration of 1 g/m^3, it is, according to the laboratory investigations, possible to attain a waste reaction gas of $C_{H2S} < 1$ mg/m^3 with a reaction volume of 10 m^3 and a waste gas flow rate of 1.000 m^3/h. From the economic point of view the process could be interesting for the purification of synthesis gas. In this respect the service life of the catalysts and thus the production price could be improved. (RB).

2730 (ETDE-mf–0721937) **Investigations on combined deposition of particulate and gaseous pollutants in a packed bed filter at high temperatures.** Peukert, W. Karlsruhe Univ. (T.H.) (Germany, F.R.). Inst. fuer Mechanische Verfahrenstechnik und Mechanik; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). [1988]. 129p. (In German). Order Number DE90721937. Available from NTIS (US Sales Only), PC A07/MF A01.

The aim of the research project was to determine the physical and chemical fundamentals of the combined deposition of dust and gaseous pollutants in a packed bed filter. For this purpose a novel approach has been chosen, with systematic measurements at room temperature being done in order to determine the separation efficiency for particle sizes between 0.01 μm and 10 μm as a function of significant filtration parameters. From the broad spectrum of parameter variations applied, measured results show the optimal conditions for the required particle deposition, and it is expected that the results can be applied to high temperatures as well. For the examinations in dependence on the temperature, a process development plant has been built which can be operated by temperatures of up to 800^{0}C. The examinations on the sorption of gaseous pollutants showed that packed bed filters can also be efficiently used for the separation of noxious gases. Though only raw, comparatively inert limestone was used as model substance conversion degrees of up to 90% for the separation of hydrogen chloride and up to 45% for the sorption of sulphur dioxide could be achieved. First formulations for the theoretical description of the break-through curves have been set up. It became evident that the extremely complex correlations of the sorption process can in principle be approximately precalculated even with comparatively simple kinetic formulations. (orig./RB).

2731 (ETDE-mf–0722264) **Options and techniques for enhanced waste heat recovery in small- and medium-sized enterprises. A guideline.** Verein Deutscher Ingenieure (VDI) - Gesellschaft Energietechnik, Duesseldorf (Germany, F.R.); Vereinigung Industrielle Kraftwirtschaft (VIK) e.V., Essen (Germany, F.R.); Forschungsstelle fuer Energiewirtschaft, Muenchen (Germany, F.R.); Fernwaerme-Forschungsinstitut in Hannover e.V., Hemmingen (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Sep 1988. 129p. (In German). Order Number DE90722264. Available from NTIS (US Sales Only), PC A07/MF A01.

Among the available waste heat recovery processes today are heat exchangers, heat pumps, ORC plants, vapour compressors, and heat transformers. External use of the recovered waste heat may interfere with the plant's operating regime and is therefore considered problematic. Internal waste heat recovery, on the other hand, is already practiced in a number of cases, as is external waste heat utilisation. The guideline presents techniques, methods of implementation, and practical decision aids for small and medium-sized enterprises who are interested in a technically feasible and economically efficient waste heat utilisation. (BR).

2732 (ETSU-R–48) **Process integration initiative. A review of the process integration activities funded under the Energy Efficiency R and D programme.** Brown, K.J. Energy Technology Support Unit, Harwell (UK). Jul 1989. 78p. Order Number DE90722715. Available from NTIS (US Sales Only), PC A05.

A review is given of the UK Dept. of Energy's involvement in the thermodynamic technique known as process integration. It has been applied across a wide range of industrial sectors and 26 feasibility studies have been performed. By the end of 1988, a total of Pound 24 million per annum of energy savings had been identified and some 47% of these had been implemented. As a result of the publicity surrounding these studies, a further Pound 30 million per annum of energy savings have been stimulated. An assessment for future involvement with the technique is proposed. (UK).

2733 (NEI-DK–213) **Energy efficient method for evaporating concentrated aqueous solutions of temperature sensitive substances. Phase 1.** Elefsen, F.; Pedersen, K. Jysk Teknologisk, Aarhus (Denmark). Energiteknik. Jun 1989. 69p. (In Danish). Order Number DE90718982. Available from NTIS (US Sales Only), PC A04/MF A01.

EFP-87.

In the present project a new method for evaporating temperature sensitive substances has been investigated. The evaporation takes place in a vacuum on hallow plastic balls containing a heat conductor, that has an alternation of phases at a temperature of 56 deg. C. The balls circulate in a closed cycle at two different pressure levels. An evaporator pressure corresponding to the pressure of saturated aqueous vapour at 46 deg. C., and a condenser pressure corresponding to the pressure of aqueous vapour at 66 deg. C. The pressure difference between the evaporator and the condenser is produced by means of an aqueous vapour compressor. The method of evaporation is patented by Jysk Teknologisk. (SH) 11 refs.

2734 (NEI-DK–216) **Diesel-driven heat pump applied to grain drying and chilling. Phase 2.** Energiministeriets Forskningsprogram 1986. Industrielle processer og apparater. Elefsen, F. Jysk Teknologisk, Aarhus (Denmark). Energiteknik. Sep 1989. 54p. (In Danish). Order Number DE90719030. Available from NTIS (US Sales Only), PC A04/MF A01.

Energiministeriets Forskningsprogram 1986. Industrielle processer og apparater.; EFP-86.

A test plant, based on a computer model developed in an earlier project, was built in order to investigate operation and energy economy. It consists of a continuous flow dryer with a capacity of 20000 kg/h and a diesel-driven heat pump which has an 8 cylinder R12 and a 6 cylinder R22 piston compressor. The motor is a 6 cylinder diesel engine with a gross power of 190 kW. Two sets of mesurements were performed in the harvest seasons of 1987 and 1988. The computer model developed in the earlier project was corrected to fit with the performed measurements. The corrected model is used to make new simulations in different working conditions. Energy saving are 50-55% more than that achieved in plants without a heat pump. The considerable amount of dust on the heat exchangers must be taken into acount. The plant must be reliable. A lot of grain can be damaged if the plant breaks down in the working period. Plants of this type must be provided with indirect evaporators

and condensers to achieve a reliable operation. In this way you can test the refrigeration system before installation. Especially in developing countries this fact is very important. (AB).

2735 (NEI-DK–227) **Water hyacinth horticulture management of manure.** Crone og Koch Raadgivende Ingenioerfirma K/S, Viborg (Denmark). Sep 1988. 111p. (In Danish). Order Number DE90719294. Available from NTIS (US Sales Only), PC A06/MF A01.

When water hyacinths are cultivated in greenhouses in solutions of manure, the plants' transpiration induces water evaporation of the manure which consequently reduces its volume. Thus a method of storing manure for use in future fertilization of crops is achieved. At the same time the plants are fertilized and can be subsequently utilized as animal fodder which will be very rich in protein. The process also results in significant energy conservation in the horticultural application. This combination of processes, and methods for producing them, as well as possible future applications, are described in detail and illustrated by graphs and diagrams. (AB) 42 refs.

2736 (PB–89-218796/XAB) **Steam stripping and batch distillation for the removal/recovery of volatile organic compounds.** Hassan, S.Q.; Herrin, J.P. Cincinnati Univ., OH (USA). Dept. of Civil and Environmental Engineering. 1989. 16p. Available from NTIS, PC A03/MF A01.

Steam stripping and batch distillation are two techniques under investigation by the Hazardous Waste Treatment Branch of the USEPA Risk Reduction Engineering Laboratory. The studies evaluated the application of these methods to aqueous and dilute organic solutions which are currently subject to land-disposal restrictions. General design equations which can be used to assess the applicability of steam stripping to achieve a given separation are included. Preliminary results of a pilot-scale steam stripping study with 2-nitropropane are reviewed. General design procedures for batch distillation are also discussed.

2737 (PB–89-222277/XAB) **Small-quantity generator's handbook for managing RCRA (Resource Conservation and Recovery Act) wastes. Wood-treating industries.** Science Applications International Corp., Bellevue, WA (USA). Jun 1988. 41p. Available from NTIS, PC A03/MF A01.

This Resource Conservation and Recovery Act (RCRA) Handbook was developed for pentachlorophenol and chromated copper arsenate wood-treating businesses to assist them in complying with pertinent sections of the requirements. Described are facility operations and the wastes generated as a result of them; the hazardous wastes generated and the RCRA regulations that specifically apply to them; the RCRA generator requirements; and hazardous and non-hazardous waste management strategies for minimizing waste generation and handling waste. Appendices provide: information regarding the acute and toxic commercial chemical products and wastes (F, P, and U wastes); the procedures for identifying characteristic hazardous wastes in wood-treating facilities; and a list of references and contacts for obtaining additional information about hazardous wastes and their regulation.

2738 (PB–89-222285/XAB) **Small-quantity generator's handbook for managing RCRA (Resource Conservation and Recovery Act) wastes. Printing and publishing.** Science Applications International Corp., Bellevue, WA (USA). Jun 1988. 50p. Available from NTIS, PC A03/MF A01.

This Resource Conservation and Recovery Act (RCRA) Handbook was developed for the printing and publishing industries to provide assistance in complying with pertinent sections of the RCRA requirements. Printing operations are summarized and the characteristics of wastes generated and general waste-management practices are described. How these waste types may be subject to the RCRA and Administrative Rules of Montana regulations based on how they are managed and on their specific characteristics is outlined. The RCRA generator requirements are discussed, while waste-management strategies for minimizing the amount of hazardous waste generated by printing businesses are described. Appendix A is a listing of acute and toxic hazardous wastes used for regulatory purposes (F, P, and U wastes). Appendix B provides a summary of RCRA characteristic wastes. Appendix C contains a list of references and contacts for obtaining more information about hazardous wastes and their regulation.

2739 (PB–89-222319/XAB) **Small-quantity generator's handbook for managing RCRA (Resource Conservation and Recovery Act) wastes. Dry cleaners and commercial laundries.** Science Applications International Corp., Bellevue, WA (USA). Jun 1988. 40p. Available from NTIS, PC A03/MF A01.

This Resource Conservation and Recovery Act (RCRA) Handbook was developed for businesses involved in dry cleaning and commercial laundering to provide assistance in complying with pertinent sections of the RCRA requirements. Dry-cleaning operations are summarized and the characteristics of wastes generated and general waste management practices are described. How these waste types may be subject to the RCRA and Administrative Rules of Montana regulations based on how they are managed and on their specific characteristics is outlined. The RCRA generator requirements are discussed, while waste-management strategies for minimizing the amount of hazardous waste generated by dry cleaners and laundries are described. Appendix A lists RCRA acute and toxic hazardous wastes (F, P, and U wastes). Appendix B provides a summary of RCRA characteristic wastes. Appendix C lists references and contacts for obtaining more information about hazardous wastes and their regulation.

2740 (PB–89-222327/XAB) **Small-quantity generator's handbook for managing RCRA (Resource Conservation and Recovery Act) wastes. Analytical laboratories.** Science Applications International Corp., Bellevue, WA (USA). Jun 1988. 43p. Available from NTIS, PC A03/MF A01.

This Resource Conservation and Recovery Act (RCRA) Handbook was developed for analytical and clinical laboratories to provide assistance in complying with pertinent sections of the RCRA requirements. Laboratory operations are summarized and the characteristics of wastes generated and general waste management practices are described. How these waste types may be subject to the RCRA and Administrative Rules of Montana regulations based on how they are managed and on their specific characteristics is outlined. The RCRA generator requirements are discussed, while waste-management strategies for minimizing the amount of hazardous waste generated by laboratories are described. Appendix A is a listing of acute and toxic hazardous wastes (F, P, and U wastes) used for regulatory purposes. Appendix B provides a summary of RCRA characteristic wastes. Appendix C contains a list of references and contacts for obtaining more information about hazardous wastes and their regulation.

2741 (PB–89-222590/XAB) **Recovery of metals using aluminum displacement.** Meyers, S.C. Circuit Chemistry Corp., Maple Plain, MN (USA). Jun 1988. 35p. Available from NTIS, PC A03/MF A01.

This report documents a project to recover metals from metal-finishing waste streams using aluminum displacement as a pretreatment process rather than the standard pretreatment process of removing metals from the effluent before discharge, resulting in a sludge that must be disposed of as hazardous waste. The project found that a single pass through aluminum-exchange reactors resulted in 85% or more of the metals being removed from the waste stream.

2742 (PB–89-222814/XAB) **Waste-minimization insights for the polymer industry.** Howell, S.G.; Randall, P.M. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. 1989. 11p. (EPA–600/D-89/085). Available from NTIS, PC A03/MF A01.

The huge volumes of polymeric materials produced in this country can also result in the production of large volumes of wastes consisting of off spec polymers, process solvents, additives, stabilizers, and gaseous emissions. The EPA has recently instituted an effort to work with the industry to minimize these wastes, which will not only result in lower pollution, but if properly thought out and instituted, result in cost savings. Economic pressures have always been a tremendous incentive to minimize waste and maximize production. The authors suggest that a joint industry/EPA program be set up to accomplish this and offer some suggestions on areas in which to start.

2743 (PB–89-223663/XAB) **Incinerability index: A measure of incinerator performance.** Thurnau, R.C. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. May 1989. 24p. (EPA–600/D-89/081). Available from NTIS, PC A03/MF A01.

Since promulgation of the hazardous-waste incinerator performance standards in January 1981, there has been a continuing interest in validating a real-time surrogate means of measuring incinerator compliance with the destruction and removal efficiency (DRE) performance standard. One such possible surrogate is sulfur hexafluoride (SF_6). SF_6 is one of the most stable compounds known with respect to thermal decomposition. Thus, it has been hypothesized that the SF_6 DRE would represent a lower bound to other principal organic hazardous constituent DREs in an incinerator. Further, SF_6 can be measured at very low concentrations in flue gas on a real-time basis using onsite gas-chromatographic techniques. Thus, use of SF_6 injection with real-time DRE measurement represents a potentially attractive surrogate DRE measure for determining continuous compliance with the DRE performance standard.

2744 (PB–89-224075/XAB) **Waste audit study: Automotive paint shops.** SCS Engineers, Inc., Long Beach, CA (USA). Jan 1987. 108p. Available from NTIS, PC A06/MF A01.

See also PB–89-224083.

This report presents the results of a waste-audit study of automotive paint shops. The study focuses on the types and quantities of wastes generated, treatment and disposal alternatives, and the potential for reducing the amount and/or toxicity of waste generated. The analysis of solvent waste minimization focused primarily on in-plant modifications (e.g., source reduction) to reduce the generation of solvent waste. Strict inventory control is the most-readily implementable approach. While in-house recycling is viable, it is usually only cost-effective for larger firms. Specific recommendations for waste reduction were made.

2745 (PB–89-224109/XAB) **Wisconsin waste reduction and recovery plan.** Reindl, J. Wisconsin Dept. of Natural Resources, Madison, WI (USA). Bureau of Solid Waste Management. Feb 1986. 78p. Available from NTIS, PC A05/MF A01.

This plan sets goals and strategies to reduce further the amount of waste being landfilled by promoting the reduction of the quantity of waste generated, the reuse, recycling, and composting of materials; and the recovery of energy from waste. The document comes up with an action plan for implementation and includes appendices of waste quantities and composition calculations; technologies for alternative waste reduction, recycling, and recovery; state statutes and administrative codes; and a bibliography of the Department of Natural Resources' publications on recycling.

2746 (PB–89-224117/XAB) **Waste audit study: Research and educational institutions.** Stone (Ralph) and Co., Inc., Los Angeles, CA (USA). 15 Aug 1988. 152p. Available from NTIS, PC A08/MF A01.

This document reports on hazardous-waste reduction audits performed at three diverse research/educational institutions in southern California. Waste-reduction opportunities identified include: utilizing microscale experiments; chemical substitution; treating waste chemicals in the final step in experiments; and recycle, recovery, and treatment options. A generic self-audit was developed for use by educational and research institutions throughout the state.

2747 (PB–89-224729/XAB) **Evaluation of emission sources from creosote wood-treatment operations. Final report.** Vaught, C.C.; Nicholson, R.L. Midwest Research Inst., Cary, NC (USA). Jun 1989. 88p. Available from NTIS, PC A05/MF A01.

This document discusses each of the preservatives and the processes used to treat a variety of wood products, concentrating on the use of creosote for the treatment of crossties. Of particular concern are the emission sources associated with the release of odor and air toxics and the technologies currently in use to control them.

2748 (PB–89-224786/XAB) **Reduction of arsenic wastes in the electronics industry (application to study). Final report.** Envirosphere Co., Santa Ana, CA (USA). Jun 1987. 115p. Available from NTIS, PC A06/MF A01.

This publication is the final report of a group studying the reduction of arsenic wastes in the electronics industry. They used the gallium arsenide (GaAs) chip manufacturing process at the Hewlett-Packard Company's San Jose facility as a model. The study found that ingot grinding and slicing produced approximately 90% of all arsenic waste. They also discovered that 95% of arsenic waste existed in the particulate form. These findings indicated that a filter in combination with a filter press could recover the vast majority of arsenic from the waste-water stream. In addition to recovering a valuable product (GaAs), the arsenic waste currently transported as an extremely hazardous waste to a class I landfill would be reduced by greater than 95%.

2749 (PB–89-224794/XAB) **Reduction of solvent wastes in the electronics industry. Waste reduction grant program. Final report.** Envirosphere Co., Santa Ana, CA (USA). Jun 1988. 97p. Available from NTIS, PC A05/MF A01.

The microelectronics component manufacturing processes at Hewlett Packard's San Jose facility were used as a model to study the techniques required to reduce the volume and type of organic-solvent wastes in the electronics industry. Although organic-solvent wastes are produced from numerous complex wafer fabrication steps, the volume and type of solvents utilized in each step were documented and evaluated for waste reduction. This study indicates that up to a 70% reduction in organic-solvent waste volume at the facility could be realized. This represents a potential cost savings to Hewlett Packard of up to $414,000 per year in disposal costs and chemical-purchase costs. The findings of this study indicate that solvent segregation, solvent substitution, direct solvent reuse, and distillation/evaporation are the primary solvent-handling processes that could be utilized to accomplish this reduction.

2750 (PB–89-225254/XAB) **Safe disposal of hazardous wastes: The special needs and problems of developing countries. Volume 1-Volume 3. World Bank technical paper.** Batstone, R.; Smith, J.E.; Wilson, D. International Bank for Reconstruction and Development, Washington, DC (USA). 1989. 845p. (WORLD-BANK-TP–93). Available from NTISMF E04.

Library of Congress catalog card no. 89-5670; Microfiche copies only. Paper copy available from World Bank, 1818 H. St., NW, Washington, DC 20433.

The World Bank, World Health Organization, and United Nations Environment Program have cooperated in the preparation and issuance of The Safe Disposal of Hazardous Wastes. The three-volume manual is intended for administrators and technical staff, primarily in developing countries, who have responsibilities for waste management, public health and environmental protection. Information presented in the publication includes the classification of hazardous-waste, its effects on health and the environment, the planning and implementation of programs in hazardous waste management, hazardous-waste treatment, and disposal technologies, including economic and institutional considerations. The main emphasis of the manual is on the management aspects and on the technologies that may be appropriate for implementing a region-wide hazardous-waste management program.

2751 (PB–89-871123/XAB) **Wastepaper recycling. January 1976-September 1989 (Citations from the Paper and Board, Printing, and Packaging Industries Research Associations data base). Report for January 1976-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 149p. Available from NTISPC N01/MF N01.

Supersedes PB–86-862687.

This bibliography contains citations concerning the recycling of waste-paper fibers for the production of new paper products. The development of the recycling industry; flotation processes; recycled fiber properties and improvement methods; and the installation, operation, and maintenance of paper-recycling systems are among the topics discussed. Applications, markets, economics, regulations, production statistics, and waste-paper salvaging are considered. De-inking of waste paper is examined in a separate bibliography. (This updated bibliography contains 249 citations, 42 of which are new entries to the previous edition.)

2752 (PB–89-871248/XAB) **Pulping effluents: Biological treatment. January 1976-September 1989 (Citations from the**

Paper and Board, Printing, and Packaging Industries Research Associations data base). Report for January 1976-September 1989. National Technical Information Service, Springfield, VA (USA). Sep 1989. 35p. Available from NTISPC N01/MF N01.

Supersedes PB-86-871936.

This bibliography contains citations concerning effluent and wastewater biological treatment and disposal in the pulping industry. Effluent toxicity; treatment plant management, treatment systems and equipment design; combined mechanical and biological treatment processes; biological degradation treatment in chemical pulp mills; and the handling and disposal of solid wastes are among the topics discussed. Performance evaluations of biological treatment processes in domestic and foreign plants in full scale operation and pilot programs are considered. (This updated bibliography contains 48 citations, 10 of which are new entries to the previous edition.)

2753 (PNL-SA-16968) **Back to basics.** Ruffin, J.E. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-8909110-9: 16. annual conference of the American Society for Quality Control, Fort Lauderdale, FL (USA), 17-20 Sep 1989). Order Number DE90002734. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Quality control/quality assurance controls were originally developed and selected for application because they were effective in preventing, reducing, or detecting specific problems that were occurring in manufacturing processes. With the development and use of quality assurance program standards, there has been a movement toward determining the requirements of a quality program standard that are "applicable" to a certain process as the starting point in the determination of the QA controls to be applied. This paper discussed the advantages of reviewing and addressing the problems, past or potential, associated with a process as the initial step in the QA control determination.

2754 (SVF-341) **Energy management.** Ahlstroem, M.; Normark, P.; Qvist, B. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). May 1989. 68p. (In Swedish). Order Number DE90719411. Available from NTIS (US Sales Only), PC A04/MF A01.

To begin with a number of basic definitions and delimitations; in particular, the definitions for Energy Control and Energy Management System (EMS) are scrutinized. Commercially available industrial EMS-systems are dealt with, their configurations discussed and commented on and an attempt is made to systemize the functions of commercial EMS-systems for industrial applications. The important interaction between EMS-systems and industrial process control systems is examined from the viewpoint of system engineering and operational safety and in terms of performance and system capability. In a similar manner commercially available EMS-systems for HVAC-applications are discussed. In the two last chapters of the paper the EMS-systems as money makers in industrial as well as HVAC-applications are discussed.

2755 (VTT-TUTK-621) **Frost resistance of concrete in artic offshore structures.** Leivo, M. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). May 1989. 142p. (In Finnish). Order Number DE90719344. Available from NTIS (US Sales Only), PC A07/MF A01.

In the literature part of this work the nature of frost attack in arctic offshore conditions is studied and reguirements for concrete according to literature in arctic offshore conditions are presented. Frost action has been examined theoretically. In the theoretical examinations the hydraulic pressure theory and the capillary ice lens segregation theory are studied. Both theories are applied to arctic offshore conditions. The aim of the experiments was to examine the effects of the pore structure on the frost resistance under an arctic freezing and thawing attack. Freezing and thawing resistance was tested with a new test method developed at VTT. Specimens were submerged in sea water and subjected to repeated freezing at the temperature of -55 deg C and thawing at +20 deg C. The pore structure of hardened concrete was determined by optical air pore analysis. Capillary water absorption test and protective pore ratio test were performed as well. The pore structure of each binder type was measured with the mercury intrusion porosimeter. On the basis of the test results the criteria for ensuring the frost resistance are given.

2756 (WSRC-tr-122) **Mixing times during the stirring of gas-charged viscous liquids (Part 3).** (Mischzeiten beim ruhren von begasten viskosen flussig-keiten (3. Teil)). Stein, W.A. 7p. Translated from Chemie-Ingenieur-Technik (F.R. Germany). *Chemie-Ingenieur-Technik (F.R. Germany),* 60(10): 792-793 (1988). Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035.

This report is the third part of an investigation of mixing times during the stirring of gas-charged viscous liquids. Topics covered are: mixing time in the bubble column; stirring power with the paddle agitator; mixing time with the blade agitator; expansion of the mixing model by a third limiting low; and comparison between blade agitator, cross blade agitator and screw spindle agitator.

2757 (WSRC-tr-123) **Studies of the homogenization of structurally viscous and viscoelastic liquids in stirring containers.** (Untersuchungen zur homogenisierung strukturviskoser und viskoelastischer flussigkeiten in ruhrbehaltern). Poertner, R.; Werner, U. 5p. Translated from Chemie-Ingenieur-Technik (F.R. Germany). *Chemie-Ingenieur-Technik (F.R. Germany),* 61(1): 72-73 (1989). Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035.

This report briefly reviews homogenization processes in stirring reactors for viscous and viscoelastic liquids. Until now a detailed description of the processes occurring in non-Newtonian fluids has been missing. For stirring devices which are ordinarily used in the laminar-turbulent transition range the mixing time characteristics were determined for Newtonian glucose and non-Newtonian CMC and PAA solutions. 4 refs. 2758 (ANL/PPRNT-89-188) **Evaluation of fuel cell technologies for electric utility applications.** Minkov, V.; Krumpelt, M.; Daniels, E.K.; Asbury, J.G.; Zeh, C.M. Argonne National Lab., IL (USA). 1989. 14p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. Order Number DE90002996. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of this article is to discuss the applicability of baseload fuel cell systems to electric utilities by comparing the technical and economic performance of contemporary power systems, such as the combined cycle and pulverized coal plants, to the performance of "traditional" and optimized fuel cell systems. Before going into the substance of that discussion, the fuel cell technology is briefly described. 6 refs., 5 figs., 4 tabs.

2759 (CONF-8908177-1) **Regional application of natural-gas-fired combined-cycle power generation.** Poch, L.A.; Gillette, J.L.; Hedman, B.A. Argonne National Lab., IL (USA). [1989]. 6p. Sponsored by Gas Research Institute. DOE Contract W-31109-ENG-38. From 24. intersociety energy conversion engineering conference; Washington, DC (USA); 6-11 Aug 1989. Order Number DE90001769. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The results of a study assessing natural-gas-fired combined-cycle (GFCC) power generation in the electric-utility sector are presented. This study quantified the economic benefits attributable to GFCC generation and examined the characteristics of GFCC technology that produce these benefits and the ways that these benefits vary among regions in the country. The impacts of changes in important economic parameters (capital cost, fuel price, etc.) as well as the impact of advances in GFCC technology were considered. Use of GFCC technology in the electric-utility sector could play an important role in a least-cost planning strategy and thereby provide significant benefits to the utilities and their customers. Potential benefits include reduced capital and operating costs, more effective matching of load growth and capacity additions, and greater system reliability. 8 refs., 3 tabs.

2760 (ETDE-mf–0721946) **Rationalization of aerobic-thermophilic stabilisation by means of raw sludge dehydration.** Poepel, H.J.; Bau, K.; Glasenapp, J. Technische Hochschule Darmstadt (Germany, F.R.). Inst. fuer Wasserversorgung, Abwasserbeseitigung und Raumplanung; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Dec 1988. 291p. (In German). Contract BMFT 02-WS 411/4. Order Number DE90721946. Available from NTIS (US Sales Only), PC A13/MF A01.

These investigation results show that, by means of aerobic-thermophilic stabilization, perfect stabilization results can be achieved throughout the year with simultaneous decontamination (with stay periods of 4 to 5 days) if the crude sludge first is mechanically thickened to TR contents of up to 8 percent. The precondition for this is the perfect adaptation of aeration and mixing to the higher substrate concentration of the mechanically thickened crude sludges. (orig./EF).

2761 (NEI-DK–229) **District heating connections with high consumption.** Energiministeriets Energiforskningsprogram. Fjernvarme og produktion af el og varme. Bryder, K.L.; Munk Pedersen, J. Jysk Teknologisk, Aarhus (Denmark); Cowiconsult Raadgivende Ingenioerer A/S, Virum (Denmark). Jul 1989. 312p. (In Danish). Order Number DE90719301. Available from NTIS (US Sales Only), PC A14/MF A01.

Energiministeriets Energiforskningsprogram. Fjernvarme og produktion af el og varme.; EFP-86. Related to EM-1413/86-8; Forsidetitel: Storborbrugerens installationer.

The object was to demonstrate the reasons why large heat consuming installations cause wasteful energy generation and uneconomic overall operational running of most district heating plants. The paper includes descriptions and analyses of 36 typical installations including tests and proposals for improvements within installations, a catalogue on large heat consuming installations and, instructions for operational control of connections by large heat consuming installations. Factors influencing uneconomic operation because of large-scale consumers. Poor cooling of the district heating water, e.g. less than 30 deg. C.. The fact that higher temperatures are required than for small-scale consumers, e.g. more than 80 deg. C and that high differential pressure is necessary e.g. more than 0.5 bar. Also, consumption varies a great deal, e.g. due to oscillating automatic control equpment. 10 district heating supply plants representing a range of different categories of buildings and connections and types of installations were surveyed. Reasons for unsatisfactory operational conditions were poor temperature regulation and inappropriate shunts (e.g. double shunting), water supply mains inappropriately connected and faults in automatic control equipment. District heating plants managers should to put pressure on large heat consumers by regular supervision of operational conditions at the relevant large heat consuming installation, focusing on cooling, installation of control equipment to limite the minimum cooling of the water, e.g. to more than 30 deg. C and economic sanctions in the form of, e.g., imposing charges where the cooling is less than 30 deg. C. (AB).

2762 (NEI-DK–230) **Utilization of computerized control for optimization of energy systems.** Innosys ApS, Copenhagen (Denmark). Feb 1989. 46p. (In Danish). Order Number DE90719311. Available from NTIS (US Sales Only), PC A03/MF A01.

Methods of building up a computer program which can be used for the operational control of district heating or local power plants and in this way achieve optimal operational efficiency. (AB).

2763 (PB–89-221360/XAB) **Trial burns: methods perspective.** Johnson, L.D. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Research and Exposure Assessment Lab. Feb 1989. 13p. (EPA–600/D-89/043). Available from NTIS, PC A03/MF A01.

When conducting a trial burn, it is necessary to make a number of measurements to adequately define the performance of the incinerator. In addition to flue-gas emissions for particulate matter, HCl, and selected organics, it is also necessary to measure selected organics in the waste feed, incinerator operating temperature, stack gas volume flow, waste feed rate, and many other important parameters. A relatively small, but important segment of this trial burn sampling and analysis universe is addressed in this paper. The sampling and analysis procedures receiving the most attention until recently have been those for organic compounds. The knowledge base and availability of detailed procedures is still expanding. Recently, concerns about metals emissions have caused further research into sampling technology in that area. Accordingly, the principal sampling and related analytical methods discussed are Method 0010, Method 0030, and the new Multiple Metals Train.

2764 (PB–89-221410/XAB) **Treatment technology background document.** Berlow, J.R.; Vorbach, J. Environmental Protection Agency, Washington, DC (USA). Office of Solid Waste. Jun 1989. 253p. (EPA–530/SW-89/048A). Available from NTIS, PC A12/MF A01.

This document, consisting of descriptions of 23 treatment technologies, includes information relevant to the use and understanding of the background documents for each group of listed hazardous wastes subject to the RCRA Land Ban restrictions. These treatment technology descriptions represent a revision to previously published versions. Typically, the revisions made were editorial in nature. The reader should note that the document has not been peer reviewed.

2765 (PB–89-221428/XAB) **Methodology for developing best demonstrated available technology (BDAT) treatment standards.** April, R. Environmental Protection Agency, Washington, DC (USA). Office of Solid Waste. May 1989. 81p. (EPA–530/SW-89/048B). Available from NTIS, PC A05/MF A01.

See also PB–89-221410 and PB–89-142301.

This document summarizes EPA's approach for implementing the land-disposal restrictions program. Section 2 presents the legal authority under which the Agency is basing its regulations; Section 3 describes the technical methodology EPA uses to define treatment standards for restricted hazardous wastes. Section 4 discusses variances from these treatment standards, and finally, Section 5 presents the Agency's approach to the special problems raised by the P and U listed hazardous-waste categories in 40 CFR 261.33.

2766 (PB–89-221444/XAB) **Best demonstrated available technology (BDAT) background document for organophosphorous wastes.** April, R.; Cunningham, M. Versar, Inc., Springfield, VA (USA). Jun 1989. 62p. Available from NTIS, PC A04/MF A01.

See also PB–89-142251 and PB–89-221428.

This background document provides the Agency's technical support for selecting and developing treatment standards for the constituents to be regulated in these organophosphorous wastes. Section 2 presents waste-specific information; Section 3 discusses the applicable and demonstrated technologies used to treat these wastes; Section 4 presents the available performance data; Section 5 explains EPA's determination of BDAT, while Section 6 discusses the selection of constituents to be regulated, and Section 7 presents treatment standards for these constituents.

2767 (PB–89-221451/XAB) **Best demonstrated available technology (BDAT) background document for phthalate wastes.** April, R.; Rosengrant, L. Versar, Inc., Springfield, VA (USA). Jun 1989. 55p. Available from NTIS, PC A04/MF A01.

See also PB–89-142244 and PB–89-221444.

This document provides the Agency's technical support for selecting and developing treatment standards for the constituents to be regulated in the phthalate wastes. Sections 2 through 7 present waste-specific information for the K023, K093, and K094 wastes. Section 8 presents a discussion of the development of treatment standards for those phthalate wastes designed as U wastes (U028, U069, U088, U102, U107, and U190).

2768 (PB–89-221469/XAB) **Best demonstrated available technology (BDAT) background document for K009 and K010.** April, R.; Labiosa, J. Versar, Inc., Springfield, VA (USA). Jun 1989. 63p. Available from NTIS, PC A04/MF A01.

See also PB–89-221451 and PB–89-139117.

This background document provides the Agency's technical support for selecting and developing treatment standards for the only regulated constituent (i.e., chloroform) for the K009 and K010 wastes. Section 2 presents waste-specific information; Section 3 discusses the applicable and demonstrated technologies used to treat the waste; Section 4 summarizes the available performance

data; Section 5 explains EPA's determination of BDAT, while Section 6 discusses the selection of the regulated constituent and deletion of some K009 and K010 constituents originally selected in the proposed rule. Finally, Section 7 presents the determination of the treatment standards.

2769 (PB–89-221477/XAB) **Best demonstrated available technology (BDAT) background document for K011, K013, and K014. Final report.** April, R.; Chatmon-McEaddy, M. Versar, Inc., Springfield, VA (USA). Jun 1989. 104p. Available from NTIS, PC A06/MF A01.

See also PB–89-139646 and PB–89-221469.

This background document presents the Agency's technical support for selecting and developing the treatment standards for the constituents to be regulated in the acrylonitrile nonwaste waters. The document also contains some information relevant to the acrylonitrile wastewaters. THE EPA will summarize any additional information used to develop performance standards for the waste waters from acrylonitrile production in an addendum to the background document. Because of facility claims of confidentiality, the document does not contain all of the data that EPA used in its regulatory decision-making process.

2770 (PB–89-221485/XAB) **Best demonstrated available technology (BDAT) background document for cyanide wastes.** April, R.; Chatmon-McEaddy, M. Versar, Inc., Springfield, VA (USA). Jun 1989. 311p. Available from NTIS, PC A14/MF A01.

See also PB–89-142228 and PB–89-21477.

This background document provides the Agency's technical support for selecting and developing proposed treatment standards for the constituents to be regulated for the electroplating and metal heat-treating wastes. Sections 2 through 7 present information for the F-code wastes. Section B discusses associated inorganic cyanide P-code wastes and details the development of the proposed treatment standards for these wastes.

2771 (PB–89-221493/XAB) **Best demonstrated available technology (BDAT) background document for K043. Final report.** April, R.; Vorbach, J. Versar, Inc., Springfield, VA (USA). Jun 1989. 47p. Available from NTIS, PC A03/MF A01.

See also PB–89-221485 and PB–89-142236.

The background document provides the Agency's technical support for selecting and developing the proposed treatment standards for the constituents to be regulated in K043 waste. Section 2 presents waste-specific information Section 3 discusses the technologies used to treat the waste; Section 4 presents available performance data; Section 5 explains EPA's detention of BDAT; while Section 6 discusses the selection of constituents to be regulated; and the treatment standards are determined in Section 7.

2772 (PB–89-221501/XAB) **Best demonstrated available technology (BDAT) background document for wastes from the production of chlorinated aliphatic hydrocarbons F024. Final report.** Berlow, J.R.; Vorbach, J. Radian Corp., Research Triangle Park, NC (USA). May 1989. 30p. Available from NTIS, PC A03/MF A01.

This background document provides the Agency's rationale and technical support for selecting the constituents to be regulated as F024 wastes and for developing treatment standards for these constituents. The document also provides waste characterization data that serve as a basis for determining whether a variance from a treatment standard may be warranted for a particular type of F024 that is more difficult to treat than the wastes that were analyzed in developing treatment standards for F024.

2773 (PB–89-221519/XAB) **Best demonstrated available technology (BDAT) background document for wastes from the production of 1,1,1-trichloroethane K028, K029, K095, and K096. Final report.** Berlow, J.R.; Jones, L. Radian Corp., Research Triangle Park, NC (USA). 25 May 1989. 96p. Available from NTIS, PC A05/MF A01.

See also PB–89-221501.

This background document provides the Agency's rationale and technical support for selecting the constituents regulated in K028, K029, K095, and K096 nonwaste waters and K028 waste waters and for developing treatment standards for these constituents. The document also provides waste-characterization data that serve as a basis for determining whether a variance from treatment standards may be warranted for a particular type of K028, K029, K095, or K096 waste that is more difficult to treat than the wastes that were analyzed in developing the treatment standards for K028, K029, K095, and K096 nonwaste waters and K028 waste waters.

2774 (PB–89-221527/XAB) **Best demonstrated available technology (BDAT) background document for wastes from the production of dinitrotoluene, toluenediamine, and toluene diisocyanate (K027, K111, K112, K113, K114, K115, K116, U221, and U223). Final report.** Labiosa, J.E. Environmental Protection Agency, Washington, DC (USA). Office of Solid Waste. May 1989. 106p. (EPA–530/SW-89/048O). Available from NTIS, PC A06/MF A01.

See also PB–89-142285 and PB–89-221519.

This background document provides the Agency's treatment standards for wastes from the production of dinitrotoluene, toluenediamine, and toluene diisocyanate (K027, K113-4116, U221, and U223). The Agency is not proposing treatment standards for the newly listed wastes K111 and K112 at this time. The document presents waste-specific information, the number and locations of facilities affected by the land-disposal restrictions for K027, K113-K116, U221 and U223 wastes, the waste-generating process, characterization data, and the technologies used to treat the waste or similar wastes. The document also explains the determination of BDAT, selection of constituents to be regulated, and calculation of treatment standards.

2775 (PB–89-223903/XAB) **Analytical methods necessary to implement risk-based criteria for chemicals in municipal sludge.** Bruins, R.J.F.; Fradkin, L.; Stara, J.F.; Peirano, W.B.; Molak, V. Environmental Protection Agency, Cincinnati, OH (USA). Office of Environmental Criteria and Assessment. 1989. 11p. (EPA–600/D-89/031). Available from NTIS, PC A03/MF A01.

Pub. in Chemical and Biological Characterization of Sludges, Sediments, Dredge Spoils and Drilling Muds, ASTM STP 976, 465-471 (1988).

The Ambient Water Quality Criteria that were promulgated by the U.S. Environmental Protection Agency in 1980 included water concentration levels which, for many pollutants, were so low as to be unmeasurable by standard analytical methods. Criteria for controlling toxics in municipal sludge would likely pose similar problems of sampling and analysis. Risk-assessment methodologies recently developed by the U.S. EPA provide criteria derivation procedures for each of the following sludge management practices: land application (including distribution and marketing), landfilling, incineration, and ocean disposal. These methodologies recommend that numerical limits on toxicant concentrations in sludge, or on rates of toxicant disposal, should be used to minimize risk to human health and the environment. Implementation of these numerical criteria would require refinement of sampling and analytical techniques for sludges, and various types of field validation studies would be needed to ensure that the criteria are appropriately protective.

2776 (PB–89-224067/XAB) **Turning off the tap: Strategies for hazardous waste minimization in the city of Los Angeles.** Cal-Tech Management Associates, Sacramento, CA (USA). Apr 1987. 143p. Available from NTIS, PC A07/MF A01.

This document is a report on strategies for hazardous-waste minimization for the city of Los Angeles. The report recommends twenty-two actions for the city within a waste-minimization program. The document examines the following topics: Waste Reduction in a Regulatory Context; Hazardous Materials and Waste Management in Los Angeles City and County; Types of Source reduction and local case studies; the elements of a local government waste-reduction program: information and technical assistance; incentives and disincentives for waste reduction; financing waste reduction in the public and private sectors. The document concludes with a 24-page bibliography.

2777 (PB–89-232607/XAB) **Residential cogeneration system development. Annual interim report, February 1988–January 1989.** Drewry, H.S. Kohler Corp., WI (USA). Apr 1989. 30p. Available from NTIS, PC A03/MF A01.

A residential cogeneration system in the range of 4 to 5 kW was developed. The system design effort was placed on developing a

cogeneration system that not only provides heat and electrical power to the home, but also could operate independently of the electrical grid and provide standby or emergency power. Another consideration in the design approach to residential cogeneration was the belief that the small amount of power that could be sold back to the utility could not justify the expense/complex switchgear required. Hence, the approach was to switch individual circuits from the cogeneration system to the utility as required to maximize the cogeneration system load.

2778 (PB–89-871297/XAB) **Incineration studies. October 1985-September 1989 (Citations from the COMPENDEX data base). Report for October 1985-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 106p. Available from NTISPC N01/MF N01.

Supersedes PB–88-868864.

This bibliography contains citations concerning incineration of municipal, industrial, agricultural, and shipboard wastes. Topics include incinerator design, air pollution control, materials and heat recovery, pyrolysis incineration, and economic evaluations. Some attention is given to waste-to-energy operations. (This updated bibliography contains 217 citations, 17 of which are new entries to the previous edition.)

2779 (SVF–340) **Quality control and requirements for corona heated HDPE casing for district heating pipelines.** Janson, L.E. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). May 1989. 101p. (In Swedish). Order Number DE90719410. Available from NTIS (US Sales Only), PC A06.

In the present investigation comparative studies have been performed of casing pipes which have been subjected to various degrees of corona treatment. The aim of the study was to try to work out such requirements and testing methods, which would contribute to preventing harmless corona treatment to be applied. The result of the investigation is a recommendation to introduce a standard testing method to expose harmful corona treated pipes. Thus it is proposed a measuring of the absorption spectra at wave length corresponding to 1,710-1,740 cm^{-1} when a thin layer of the pipe material taken from the inner wall surface is irradiated by infrared (IR) light. The thickness of the sample should be standardized to 0.05 mm (+- 0.02 mm). The absorption shall be put in relation to the exact thickness of the sample expressed in mm. The test result shall consequently be given as absorption per 1 mm. This value is recommended not to exceed 0.2 (abs. mm^{-1}). The testing has to be performed as type testing of a corona treatment procedure as well as for continuous manufacturing control. The testing method should also be used as a part of a regular pipe delivery control. It is further recommended that casing pipes meant to be corona treated have to be manufactured by using only original polyethylene grade without any mixture of reworked material.

33 ADVANCED AUTOMOTIVE PROPULSION SYSTEMS

2780 (N–89-27700) **Antiproton powered propulsion with magnetically confined plasma engines.** Lapointe, M.R. Sverdrup Technology, Inc., Cleveland, OH (USA). Aug 1989. 26p. (NASA-CR–185131;E–5025;NAS–1.26:185131;AIAA–89-2334;CONF-8907118–: 25. American Society of Mechanical Engineers joint propulsion conference, Monterey, CA (USA), 10-13 Jul 1989). Available from NTIS, PC A03/MF A01.

Matter-antimatter annihilation releases more energy per unit mass than any other method of energy production, making it an attractive energy source for spacecraft propulsion. In the magnetically confined plasma engine, antiproton beams are injected axially into a pulsed magnetic mirror system, where they annihilate with an initially neutral hydrogen gas. The resulting charged annihilation products transfer energy to the hydrogen propellant, which is then exhausted through one end of the pulsed mirror system to provide thrust. The calculated energy transfer efficiencies for a low number density (10(14)/cu cm) hydrogen propellant are insufficient to warrant operating the engine in this mode. Efficiencies are improved using moderate propellant number densities (10(16)/cu cm), but the energy transferred to the plasma in a realistic magnetic mirror system is generally limited to less than 2 percent of the initial proton-antiproton annihilation energy. The energy transfer efficiencies are highest for high number density (10(18)/cu cm) propellants, but plasma temperatures are reduced by excessive radiation losses. Low to moderate thrust over a wide range of specific impulse can be generated with moderate propellant number densities, while higher thrust but lower specific impulse may be generated using high propellant number densities. Significant mass will be required to shield the superconducting magnet coils from the high energy gamma radiation emitted by neutral pion decay. The mass of such a radiation shield may dominate the total engine mass, and could severely diminish the performance of antiproton powered engines which utilize magnetic confinement. The problem is compounded in the antiproton powered plasma engine, where lower energy plasma bremsstrahlung radiation may cause shield surface ablation and degradation.

2781 (AD-A–210381/0/XAB) **Compatibility of fuel-system components with high density fuel. Final report, April 1987-January 1989.** Grenich, A.F.; Johnson, A.M. Boeing Advanced Systems Co., Seattle, WA (USA). May 1989. 179p. Available from NTIS, PC A09/MF A01.

Environmental and endurance tests were conducted to evaluate the performance of typical fuel-system components when exposed to high-density aviation turbine engine fuel. The environment tests simulated the extreme high and low temperatures encountered in hot- and cold-day missions. The results revealed that the high-density fuel (HDF) would not have any fuel boiling or freezing problems but the pump power required for HDF was higher than for JP-4 fuel as was expected and the lower heat capacity of HDF resulted in noticeably higher heat-exchanger discharge temperatures. The endurance tests revealed that the HDF would not cause abnormal wear or component leakage. Nothing in the test results suggested that current inputs to fuel-system life-cycle-cost models should be modified if HDF is used.

2782 (AD-A–210393/5/XAB) **Ceramics for transportation engines - siren or solution.** Myers, P.S. Wisconsin Univ., Madison, WI (USA). Mar 1989. 19p. Available from NTIS, PC A03/MF A01.

Pub. in Applied Mechanics Reviews, Vol. 42, No. 3, 53-69(Mar 1989).

This paper first reviews the challenges facing transportation engines, particularly cyclic-combustion engines (CCE), which, in numbers, bear the major burden of providing both personal and commercial transportation for mankind. While challenges are not new to CCE, it is imperative that answers be found to these challenges both for the welfare of society and for the survival of CCE. As background for understanding possible answers to these challenges and the part that new materials will play in meeting these challenges, this paper will try to summarize our new and increased understanding of the basic structure of matter. This understanding is essential to comprehending the relationship between atomic and molecular structure, microscopic structure, material processing, and the properties of the resulting materials. The paper will then try to summarize the state of knowledge concerning the use of an old but new material, ceramics, in meeting the challenges faced by cyclic-combustion engines.

2783 (DOE/NASA–0352-3) **Sliding seal materials for low heat rejection engines.** Beaty, K.; Lankford, J.; Vinyard, S. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center; Southwest Research Inst., San Antonio, TX (USA). Jul 1989. 135p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AI01-86CE50162. (NASA-CR–182262;SWRI–06-7963). Order Number DE90002640. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

Sliding friction coefficients and wear rates of promising piston seal materials were measured under temperature, environmental, velocity, and loading conditions that are representative of the low heat

rejection (LHR) diesel engine environment. These materials included carbides, oxides, and nitrides. In addition, silicon nitride and partially stabilized zirconia disks (cylinder liners) were ion-implanted with TiNi, Ni, Co, and Cr, and subsequently run against carbide pins (piston rings), with the objective of producing reduced friction via solid lubrication at elevated temperature. Friction and wear measurements were obtained using pin-on-disk laboratory experiments and unique engine friction test rig. Unmodified ceramic sliding coupled were characterized at all temperatures by friction coefficients of 0.24 and above during the pin-on-disk tests. The coefficient at 800°C in an oxidizing environment was reduced to below 0.1, for certain material combination, by the ion-implantation of TiNi or Co. This beneficial effect was found to derive from the lubricious Ti, Ni and Co oxides. Similar results were demonstrated on the engine friction test rig at lower temperatures. The structural integrity and feasibility of engine application with the most promising material combination were demonstrated during a 30-hour single-cylinder, direct-injection diesel engine test. 44 refs., 87 figs., 5 tabs.

2784 (DOE-tr–89-40) **The solitude of a determined inventor.** (La solitude de l'inventeur de fond: L'Unite No. 366). de Gravelaine, F. USDOE, Washington, DC (USA). [1989]. 7p. Translation of. Sponsored by U.S. DOE Management & Administration. Order Number DE90002748. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report discusses an inventor and his invention. The invention is said to make gasoline engines more efficient and nearly pollution free. (JEF)

2785 (ETDE-mf–0717917) **Methanol fuel M 100. Study into boundary conditions and optimisation of constituents.** Lange, W. Deutsche Shell A.G., Hamburg (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Mar 1988. 98p. (In German). BMFT TV 8373. Order Number DE90717917. Available from NTIS (US Sales Only), PC A05/MF A01.

In the present report problems and attempts at solutions are described which were gained above all on the basis of findings in the practice of driving as well as by systematic investigations with test bench engines and laboratory methods. In the operation with methanol (M 100) as fuel the problems are the corrosion effects, the optimization of the starting and running up behaviour in Otto engines, increase in the ignition performance of diesel engines and improvement of the lubricity. (EF).

2786 (PB–89-213821/XAB) **Development of mechanical-pilot injection device for automotive diesel engines.** Sato, T.; Kawagoe, M.; Yamada, M.; Fujimura, T. Toyota Motor Co. Ltd., Aichi (Japan). 1988. 8p. Available from NTIS, PC EE07.

Text in Japanese; Included in Toyota Engineering, Vol. 38, No. 2, 9-16(1988).

With the objective of developing a practicable pilot injection device, simulations were conducted of various simple mechanisms to determine the best specifications and analyze the fuel-injection characteristics. Based on the results, an accumulating type pilot-injection device, which enables the injection-pump pressure-chamber volume to be increased at a given moment during the fuel-compression stroke, was developed and found to remarkably decrease the knock noise during cold idling. An investigation into the effects of the device on output power, exhaust emissions, cold startability, and durability revealed that it is eminently suitable for practical application.

2787 (PB–89-229355/XAB) **Fuel-injected system for diesel engines with injection pressure control.** Nagase, K.; Funatsu, K. Railway Technical Research Inst., Kokubunji, Tokyo (Japan). 1987. 8p. Available from NTIS(Order as PB89-229348 PC$30.00).

Included in Quarterly Reports of Railway Technical Research Institute, Vol. 29, No. 1, 41-47(Feb 1988).

To ensure the efficiency of diesel engines and to eliminate environmental pollution exhaust gas, it is desirable to control the fuel-injection system. The authors proposed a new concept of the fuel-injection control system that would theoretically make it possible to optimize the injection period and quantity of fuel freely in any operation mode of engine by adjusting the injection pressure. They applied this system to a pre-combustion chamber type engine and determined the optimum fuel-injection pressure. Further, by means of an optical fiber probe, they investigated the influence of the injection pressure upon the behavior of combustion.

2788 **Predictability of emissions from in-use vehicles at low-ambient temperature and alternate driving cycle based on standard tests.** Gurney, M.D.; Allsup, J.R. 9p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890625.

Exhaust emission data were generated from a fleet of 24 late model fuel-injected vehicles at ambient temperatures of 75°, 50°, and 20°F using a commercial gasoline with Reid vapor pressure (RVP) of 11.8 psi. Tests were conducted using the standard FTP and a low-speed cold- and hot-start test cycle. The in-use vehicles were tested in an as-received condition without engine adjustment or modification. This paper provides an analysis of the generated data.

2789 **Measurements of the three components of the velocity in the intake ports of an I.C. engine.** Bardsley, M.E.A.; Gajdeczko, B.; Boulouchos, K.; Cherhroudi, B.; Bracco, F.V. 18p. Society of Automotive Engineers, Warrendale, PA (1989). (CONF-890240–: Society of Automotive Engineers international congress and exposition, Detroit, MI (USA), 27 Feb - 3 mar 1989).

Technical Paper 890792.

The three components of the velocity were measured by laser Doppler velocimetry at 35 locations in each of the six intake ports of a single-cylinder I.C. engine motored at 600, 900, and 1200 rpm. The intake ports were designed to impart both swirl and roll to the air. Pressure was also measured at the intake and exhaust. The detailed information is valuable mostly for computations of engine flows and for the assessment of multidimensional models. However the following trends were observed. The intake velocity is affected by resonant pressure waves. The flows in the six ports tend to be similar. The three components of the ensemble- averaged velocity generally have uniform profiles across the port area, whereas the fluctuation intensities are higher at the top of the port. All velocities tend to be higher at the beginning and end of intake. Averaged over the port area and intake time, the ensemble- averaged radial and axial velocity components are about 5 times the mean piston speed, the tangential component is about 10 times, and the fluctuation intensities are between 2 and 3.4 times.

2790 (DOE/ID–10219) **National program plan for electric vehicle battery research and development: Technical plan.** Henriksen, G.L.; Douglas, D.L.; Warde, C.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). Aug 1989. 70p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE90002023. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

EVs offer the prospect of reducing US petroleum fuel usage and air pollution in major metropolitan areas. In 1987, DOE-EHP commissioned a two-phase study at INEL to produce a national plan for R&D on battery technology – the limiting component in EVs. The battery assessment phase identified the "most-promising" technologies from a comprehensive list of viable EV batteries. This multi-year R&D program plan identifies development schedules, milestones, and tasks directed at resolving the critical technical and economic issues for the most-promising developmental batteries: bipolar lead/acid, flow-through lead/acid, iron/air, lithium/iron sulfide, nickel/iron, sodium/metal chloride, sodium/sulfur, zinc/air, and zinc/bromine. 8 refs., 1 fig., 6 tabs.

2791 (DOE/ID–10252) **Electric and hybrid vehicles: Technical background report for the DOE flexible and alternative fuels**

study. Hamilton, W. EG and G Idaho, Inc., Idaho Falls, ID (USA). 21 Jul 1989. 165p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE90002218. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report was prepared to provide background information on electric and hybrid vehicles (EHVs) for a Department of Energy assessment of the costs and benefits of flexible and alternative fuel use in the US transportation sector. As required by the assessment, this report focuses on the potential characteristics and impacts of large-scale EHV production and use, rather than on the policies, decisions, activities and events which might be required to assure the introduction of EHVs into US transportation on such a scale. This report is primarily a composite of existing papers and reports on EHVs. It offers new calculations only where necessary to assemble a consistent and reasonably complete picture. Its emphasis is on results and conclusions rather than analytic methods or available data. It is intentionally brief: in comparison, the EHV test reports and technical papers from which it draws would fill a bookshelf. 14 refs., 18 figs., 55 tabs.

2792 (EGG-M–89258) **Characterization of electric vehicle velocity and power profiles using road test data.** Burke, A.F.; Fink, R.K.; Richardson, R.A.; Dowgiallo, E.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 9p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. (CONF-8908144–3: SAE conference and expo on future transportation technology, Vancouver (Canada), 6-10 Aug 1989). Order Number DE90002085. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The use of electric vehicle road test data to characterize various missions in terms of velocity time-histories and battery power profiles is discussed. The data utilized were taken on the Griffon Van at Detroit Edison using the VDAS on-board data system, which stores the data in several frequency-of-occurrence matrices. Time-based data are not available from VDAS. Construction of velocity-time cycles from the mechanical power-velocity matrices has proven to be difficult. A new VDAS, which stores the vehicle/battery data in time-based files, has been designed and built at the INEL. Bench testing of the unit is near completion and in-vehicle testing should begin in June 1989. The new VDAS utilizes the same sensors as in the original VDAS and will yield essentially the same data variables. The frequency-of-occurrence matrices can be constructed from the time-based data using a Vax 2000 workstation and commercially available software. Work is continuing on developing vehicle and battery test cycles from VDAS field data for the various missions. The availability of vehicle and battery data taken with an on-board data system permits the characterization of a variety of missions for different vehicle powertrains and batteries. Vehicle and battery designers will then have the information needed to assess the suitability of particular vehicle and battery designs for particular missions and applications. 6 refs., 8 figs., 4 tabs.

2793 (EGG-M–89361) **Battery technology assessment and R and D plan.** Henriksen, G.L. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1989]. 11p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. (CONF-8909181–6: Electric and hybrid vehicle contractors' meeting, Idaho Falls, ID (USA), 6-8 Sep 1989). Order Number DE90002007. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

To guide future EV battery R and D programs, the US Department of Energy (DOE) commissioned a comprehensive assessment of secondary battery technologies. A total of 67 battery developers – from the United States, Canada, Europe, Asia, and Africa – were solicited to submit battery design concepts for an "Improved Dual-Shaft Electric Propulsion" (IDSEP) van. A team of 10 consultants and 7 representatives from DOE laboratories evaluated 42 developer responses and consultant-prepared designs. Using six criteria – five technical/economic criteria and a maturity/technical barriers criterion – the assessment identified 12 most-promising batteries. Employing a generic EV-battery development-process framework, the assessment results were used to formulate multi-year R and D plans and schedules for the most-promising developmental batteries. 7 refs., 3 figs., 4 tabs.

2794 (ANL–89/28) **An assessment and comparison of fuel cells for transportation applications.** Krumpelt, M.; Christianson, C.C. Argonne National Lab., IL (USA). Sep 1989. 20p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. Order Number DE90001807. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Fuel cells offer the potential of a clean, efficient power source for buses, cars, and other transportation applications. When the fuel cell is run on methanol, refueling would be as rapid as with gasoline-powered internal combustion engines, providing a virtually unlimited range while still maintaining the smooth and quiet acceleration that is typical for electric vehicles. The advantages and disadvantages of five types of fuel cells are reviewed and analyzed for a transportation application: alkaline, phosphoric acid, proton exchange membrane, molten carbonate, and solid oxide. The status of each technology is discussed, system designs are reviewed, and preliminary comparisons of power densities, start-up times, and dynamic response capabilities are made. To test the concept, a fuel cell/battery powered urban bus appears to be a good first step that can be realized today with phosphoric acid cells. In the longer term, the proton exchange membrane and solid oxide fuel cells appear to be superior. 13 refs., 5 figs., 2 tabs.

2795 (PB–89-213839/XAB) **Development of thermal-resistant catalysts.** Matsumoto, S.; Miyoshi, N.; Kimura, M.; Ozawa, M. Toyota Motor Co. Ltd., Aichi (Japan). 1988. 10p. Available from NTIS, PC EE07.

Text in Japanese; Included in Toyota Engineering, Vol. 38, No. 2, 17-26(1988).

Thermal deactivation is one of the most critical factors against the durability of 3-way catalysts. First the phenomenon of the thermal deactivation was studied. The main cause of the deactivation of 3-way catalysts was the sintering of alumina support, accompanied by coalescence of noble metal particles. Next, effects of additives were studied. To stabilize the alumina support, the addition of the optimal amount of lanthanum was very effective. Moreover, lanthanum improves not only the alumina stability but also the catalytic activity. It found that lanthanum would interact with Rh to change the condition of NO adsorbed, and form the complex oxide with ceria which would enhance the activity of ceria. On the basis of the findings, optimal 3-way catalysts which have shown a significantly improved thermal durability and performance have been designed.

2796 (PB–89-220925/XAB) **Measurement of on-road vehicle emission factors in the California South Coast Air Basin. Volume 1. Regulated emissions. Final report.** Ingalls, M.N.; Smith, L.R.; Kirksey, R.E. Southwest Research Inst., San Antonio, TX (USA). Jun 1989. 172p. (SWRI–1604). Available from NTIS, PC A08/MF A01.

Portions of this document are not fully legible.

This project sampled running emissions from over 40,000 in-use vehicles in normal traffic operation in a tunnel. Slow-speed emissions, evaporative emissions, and cold-start emissions were sampled from over 340 cars in a parking garage. Sampling was accomplished by measuring the pollutant concentrations in the inlet and exhaust air of these two enclosed spaces. The difference between the inlet and exhaust concentrations was the vehicle contribution to the pollutant concentrations. Airflow as well as vehicle count and speed were determined during each sample period. These variables, when used with the pollutant concentrations, enabled emissions per vehicle to be calculated. Description of the sampling instrumentation and procedures for traffic variables and regulated emissions, as well as the regulated emission results are

presented here. Unregulated emission measurements will be presented in Volume II.

2800 (ETDE-mf–0717888) **Determination of the dependence of engine characteristics on the properties of alternative fuels.** Hesse, A.; Krause, D. Hannover Univ. (Germany, F.R.). Inst. fuer Kolbenmaschinen; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Jun 1986. 145p. (In German). BMFT MTK 0292 5. Order Number DE90717888. Available from NTIS (US Sales Only), PC A07/MF A01.

The object of the overall project are investigations of different fuel mixtures in two diesel engines with regard to ignition and burn-through behaviour, molecular structure of the fuel and its correlation to the ignition behaviour as well as to the wear characteristics of the liner and piston ring of the engines. For this purpose fuels on a basis of mineral oil, methanol and coal oil were used, with provenance and refining, mixture components and preparation conditions in the engine being of great importance. Besides the peak pressure, also the ash content, content of aromatics and acid-forming components of the mixture components have, an influence on the wear behaviour. For the ignition and burn-through characteristics parameters such as the total content of aromatics, ignition temperature, proportions of components with high cetane numbers, the concentration of a certain group of aromatics as well as the fuel density are essential. (RB).

2801 (PB–89-231575/XAB) **Caterpillar 3406 spark-ignited natural-gas-engine emissions on EPA (Environmental Protection Agency) heavy-duty transient test cycle. Topical report, March-December 1988.** Waldman, D.J.; Gladden, J.R.; Endicott, D.L.; Cull, B.A. Caterpillar, Inc., Peoria, IL (USA). Jan 1989. 45p. Available from NTIS, PC A03/MF A01.

The emissions of a lean-burn natural-gas-fueled 3406 spark-ignited engine were determined on the EPA transient emission cycle for heavy-duty vehicle engines. The engine was rated at 350 hp at 1800 rpm. The engine was a minimally modified generator-set engine developed under the same GRI contract and was not optimized for truck applications or transient emissions. Transient emissions in g/hp-hr were 4.1 NOx, 9.2 total hydrocarbons, 0.84 non-methane hydrocarbons, 3.2 CO, 0.42 aldehydes, and 0.60 particulates. Steady-state emissions were also measured. The results indicate lean-burn spark-ignited engine technology is a promising approach to meeting 1994 EPA truck-engine-emission standards. NOx and CO standards can be readily met. Hydrocarbon emissions exceed the standard in the engine as presently configured but are believed to be controllable by improved air/fuel ratio control, combustion-system modification and/or an oxidation catalyst. The particulates were primarily from the lubricating oil and should be controllable with piston ring and valve-seal improvements and/or an oxidation catalyst.

35 ARMS CONTROL

2802 (UCRL–98434) **Concerning advanced architectures for strategic defense.** Wood, L. Lawrence Livermore National Lab., CA (USA). [1988]. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8803244–1: Strategic defense initiative: first five years conference, Washington, DC (USA), 13-15 Mar 1988). Order Number DE90001894. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report gives a brief history of strategic defense, then leads to modern architectures in such programs. (JEF)

3501 Policy, Negotiations, and Legislation

2803 (DOE/DP/50066–T1) **United States policy on negative security assurances: A reassessment.** Carnahan, B. Science Applications International Corp., McLean, VA (USA). 17 Oct 1989. 23p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC01-88DP50066. Order Number DE90002551. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

during the negotiation of the Nuclear Non-Proliferation Treaty (NPT), the non-nuclear weapon states maintained that the Treaty should include "negative security assurances," (NSA) to flow to them from the nuclear weapons states, promising that they would not be subject to nuclear attack. Such assurances were not included in the NPT, in part because the United States, United Kingdom and the Soviet Union undertook to deal with this issue in some other form. The issue remains linked to the NPT regime, however, and has been considered at the NPT Review Conferences. This paper covers the current status and upgrade strategies for NSA.

3502 Proliferation

2804 **Can the U.S. economy survive a few nuclear weapons.** Sastry, M.A. (Stanford Univ., CA (USA)); Romm, J.J.; Tsipis, K. *Technology Review (USA)*, 92(3): 22-29 (Apr 1989).

This paper discusses the survivability of the U.S. economy following a small nuclear war-one involving 1-2% of the nuclear arsenals of the U.S. and U.S.S.R. The authors presume that liquid fuel facilities would be the principal target and they use a computer model commissioned by the U.S. Federal Emergency Management Agency (FEMA) to examine the fate of the U.S. economy after such an attack. Using the results of this study, the authors address the viability of the current nuclear arms buildup as well as that of the Strategic Defense Initiative (SDI).

2806 (AD-A–210307/5/XAB) **Influence of microstructure and microdamage processes on fracture at high loading rates. Final report, 1 February 1986-30 September 1988.** Giovanola, J.H.; Kloop, R.W.; Simons, J.W.; Kobayashi, T.; Shockey, D.A. SRI International, Menlo Park, CA (USA). 26 Jun 1989. 48p. (TR–90). Available from NTIS, PC A03/MF A01.

The objectives of this three-year program were to establish how microstructure and loading rate influence the fracture behavior of Ti-10V-2Fe-3Al, a promising advanced titanium alloy increasingly used in aircraft structural components, and to relate the macroscopic fracture toughness results to microdeformation and microdamage processes with a view toward developing microstructurally based fracture models. Such models are desirable to develop compositions and processing conditions resulting in optimum mechanical properties.

2807 (AD-A–210658/1/XAB) **Exploratory study of niobium, titanium, zirconium, and tantalum aluminides. Final report, 1 March 1988-31 May 1989.** Stoloff, N.S. Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Materials Engineering. 1 Jul 1989. 24p. Available from NTIS, PC A03/MF A01.

The microstructure, crystal structures of existing phases, hardness, and slip systems for several binary and ternary aluminides were determined. Arc melted samples purchased from an external supplier invariably cracked upon cooling in the arc melting unit, thereby hampering the ability to prepare mechanical-test specimens. Homogenization heat treatments in vacuum usually led to significant porosity, apparently due to loss of aluminum. The properties of arc-melted material are compared to those derived from similar compositions prepared by powder-metallurgical techniques.

2808 (AD-A–211099/7/XAB) **Rhenium alloying of tungsten heavy alloys.** German, R.M.; Bose, A.; Jerman, G. Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Materials Engineering. 1989. 6p. Available from NTIS, PC A02/MF A01.

Pub. in Powder Metallurgy International, Vol. 20, No. 3, 9-13(1989).

Alloying experiments were performed using rhenium additions to a classic 90 mass % tungsten heavy alloy. The mixed-powder system was liquid phase sintered to full density at 1500 C in 60 min The rhenium-modified alloys exhibited a smaller grain size, higher hardness, higher strength, and lower ductility than the unalloyed system. For an alloy with a composition of 84W-6Re-8Ni-2Fe, the sintered density was 17, 4 Mg/m^3 with a yield strength of 815 MPa, tensile strength of 1180 MPa, and elongation to failure of 13%. This property combination results from the aggregate effects of grain size reduction and solid solution hardening due to rhenium. In the unalloyed system these properties require post-sintering swaging and aging; thus, alloying with rhenium is most attractive for applications where net shaping is desired, such as by powder injection molding.

2809 (AD-A–211154/0/XAB) **Growth of tungsten bronze family crystals. Final technical report, 6 May 1985-30 November 1988.** Neurgaonkar, R.R.; Cross, L.E. Rockwell International Corp., Thousand Oaks, CA (USA). Science Center. Mar 1988. 197p. (SC–5441.FTR). Available from NTIS, PC A09/MF A01.

A systematic investigation of tungsten bronze crystals for electro-optic and photorefractive applications was carried out successfully. The $Sr_{1-x}BaXNb_2O_6$ (SBN) and $Ba_{2-x}SrXK_{1-y}NaYNb_5O_{15}$ (BSKNN) system crystals were grown in optical quality with and without specific impurities whose purpose is to enhance photorefractive coupling and speed. Both SBN and BSKNN crystals appear to be excellent hosts for electro-optic applications, e.g., modulators, waveguides, and spatial light modulators (SLM) and photorefractive applications, e.g., phase conjugation, image processing, optical computing and laser hardening. For photorefractive applications, cerium and chromium doping show the largest effects on photorefractive coupling and speed.

2810 (AD-A–211166/4/XAB) **Strain aging in tungsten-heavy alloys. Final report.** Dowding, R.J.; Tauer, K.J. Army Materials Research Agency, Watertown, MA (USA). Materials Technology Lab. Jul 1989. 15p. (MTL-TR–89-63). Available from NTIS, PC A03/MF A01.

It has been shown that strengthening of tungsten-heavy alloys is possible through the use of cold working and heat treatment. The source of the increased strength has been attributed to strain aging due to the presence of carbon. Further, it was shown that this increase in strength did not have to be at the expense of elongation. For a 90% tungsten-heavy alloy, the strength increased from 164.7 ksi in the as-swaged condition to 178.4 ksi when heat treated at 700C for 1 hour. Under the same conditions the elongation increased from 10.8% to 12 .2%. Similar results were observed for a 93% tungsten-heavy alloy. The strength increased from 173.9 ksi as-swaged, to 197.0.o ksi when heat treated for 1 hour at 600 C. The elongation fully recovered at 800 C, held for 1 hour.

2811 (BARC–1449) **Evaluated phase diagrams of binary metal-tellurium systems of the D-block transition elements.** Chattopadhyay, G.; Bharadwaj, S.R. Bhabha Atomic Research Centre, Bombay (India). 1989. 118p. Order Number DE90607963. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

The binary phase diagrams of metal-tellurium systems for twenty seven d-block transition elements have been critically evaluated. Complete phase diagrams are presented for the elements, chromium, manganese, iron, cobalt, nickel, copper, molybdenum, palladium, silver, lanthanum, platinum and gold, whereas, for scandium, titanium, vanadium, yttrium, zirconium, niobium, technitium, ruthenium, rhodium, hafnium, tantalum, tungsten , rhenium, osmium and iridium, the phase diagrams are incomplete and tentative. (author). 20 refs., 27 tabs., 27 figs.

2812 (BNL–43108) **Magnetic viscosity in Ni/Cu compositionally-modulated alloys.** Bennett, L.H.; Swartzendruber, L.J.; Ettedgui, H.; Atzmony, U.; Lashmore, D.S; Watson, R.E. Brookhaven National Lab., Upton, NY (USA). [1989]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-891117–6: 34. conference on magnetism and magnetic materials, Boston, MA (USA), 28 Nov - 1 dec 1989). Order Number DE90002303. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The existence of a magnetic aftereffect ("magnetic viscosity") in Ni/Cu multilayered alloys was established using a vibrating sample magnetometer at room temperature and at 86 K. It was shown that the effect is strongly dependent on the step field, H_2 (i.e., the value the field is reduced to after the magnetic moment has been aligned in high field) and exhibits a maximum relaxation rate for values of H_2 around the reverse coercive field, $-H_c$. Aftereffect behavior of this type has been observed in other materials, though most often for systems composed of superparamagnetic particles, where the relaxation freezes out at low temperatures. In contrast, the relaxation in the CMA was shown to be enhanced at 86 K over its value at room temperature. New measurements over a wider temperature range show that the enhancement in this sample reaches a maximum near 120 K, but below that temperature the relaxation does freeze out. The temperature of maximum enhancement varies from sample to sample. 6 refs.

2813 (CEA-CONF–9877) **Stress corrosion cracking of nickel base alloys characterization and prediction.** Santarini, G.;

Pinard-Legry, G. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Chimie Appliquee et d'Etudes Analytiques. 1988. 9p. (CONF-8810443--: EUROCORR'88: Symposium on Corrosion, Brighton (UK), 3-5 Oct 1988). Order Number DE90721179. Available from NTIS (US Sales Only), PC A02/MF A01.

For many years, studies have been carried out in several laboratories to characterize the IGSCC (Intergranular Stress Corrosion Cracking) behaviour of nickel base alloys in aqueous environments. For their relative shortness, CERTs (Constant Extension Rate Tests) have been extensively used, especially at the Corrosion Department of the CEA. However, up to recently, the results obtained with this method remained qualitative. This paper presents a first approach to a quantitative interpretation of CERT results. The basic datum used is the crack trace depth distribution determined on a specimen section at the end of a CERT. It is shown that this information can be used for the calculation of initiation and growth parameters which quantitatively characterize IGSCC phenomenon. Moreover, the rationale proposed should lead to the determination of intrinsic cracking parameters, and so, to in-service behaviour prediction.

2814 (CEA-R-5475) **Stress corrosion cracking of an uranium-6 weight per cent niobium in gaseous oxygen, nitrogen and hydrogen.** Brunet, H. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1989. 323p. (In French). Order Number DE90721226. Available from NTIS (US Sales Only), PC A14/MF A01.

Stress corrosion cracking (SCC) of uranium-6 weight per cent niobium alloy is studied in gaseous oxygen at room temperature (for pressures between 4.10^{-7} and 0.15MPa) and 100°C (pressure of 0.15 MPa) and in gaseous hydrogen (for pressures between 10^{-6} and 0.15 MPa). SCC map and cracking kinetics are determined as fonctions of stress-intensity factor, pressure and temperature. For oxygen, temperature seems to have no effect on the alloy embrittlement within the range of this study but the pressure influence is more complex. At room temperature, hydrogen pressure less than 0.15 MPa has no influence on the cracking kinetics. For a pressure of 0.15 MPa, fracture occurs by hydriding reaction. Complementary analyses on fracture surfaces lead to propose different mechanics responsible for cracking kinetics in these environments.

2815 (CEGB-RD/B-6040/R88) **Role of $Fe_xCr_{2-x}O_3$ standard solid solutions in the identification of rhombohedral phase composition by XRD.** Jutson, J.A.; Tempest, P.A. Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs. Nov 1988. 16p. Order Number DE90607993. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The oxide layer formed on AGR reactor steels in a CO_2/CO coolant environment contains two major components, a cubic spinel phase and a rhombohedral phase. In general the rhombohedral phase protects the underlying steel from further attack better than the spinel phase. The rhombohedral phase may be Cr_2O_3 or a solid solution of αFe_2O_3 and Cr_2O_3. The composition of the solid solution can be identified using X-ray diffraction techniques (XRD). Standard solid solutions of the rhombohedral phase have been prepared and characterised by XRD. The generation of calibration curves relating lattice parameter or d-spacing to oxide composition enables the composition of the rhombohedral phase formed on samples of reactor steels to be identified. (author).

2816 (CEGB-RD/L-3354/R88) **Ageing kinetics of CF3 cast stainless steel in the temperature range 300°C to 400°C.** Akhurst, K.N.; Pumphrey, P.H. Central Electricity Research Labs., Leatherhead (UK). Nov 1988. 23p. Order Number DE90607968. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The primary coolant pump casings for Sizewell 'B' are made from castings of ASME SA351 CF3 steel which, although predominantly austenitic, is required to contain a small proportion of ferrite. Previous studies have shown that such steels are susceptible to hardening of the ferrite, and associated losses in toughness, as a result of thermal ageing for long times at the service temperature (~ 300°C). For this reason, toughness tests are to be carried out on representative castings made by the Sizewell 'B' pump casing manufacturer. The purpose of these tests is to demonstrate adequate end-of-life fracture resistance, using material which has been given an accelerated ageing treatment. The identification and validation of a suitable ageing treatment is the subject of this Report. Ageing kinetics have been measured for ageing temperatures in the range 300 to 400°C, from the results of Charpy impact tests on material from the castings procured for the main fracture programme. Castings with ferrite levels of 15, 25 and 35% have been studied. The losses in impact toughness have been related to the kinetics of ferrite strengthening using microhardness measurements, and to microstructural changes using Field Ion Atom Probe analysis. (author).

2817 (CEGB-TPRD/M-1697/RR88) **Weld simulated US Mod 9Cr 1 Mo steel: Pt. 1. General microstructure.** Ferranti, M. Central Electricity Generating Board, Southampton (UK). Marchwood Engineering Labs. Apr 1988. 29p. Order Number DE90607959. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A microstructural investigation of simulated welds in US Mod 9Cr1Mo ferritic steel has been undertaken using transmission electron microscopy, with EDX microanalysis and hardness transverse measurements. Samples have also been normalised at 1040°C for 0.5h and tempered at 760°C for 1h under conditions which have been reported elsewhere as leading to the best creep properties. Observations include both base metal and heat affected zones in the welded and postwelded heat treated conditions. Particular emphasis was given to the interface of the above regions, where a hardness drop related to a degradation of creep properties had been detected by a number of studies. The results include the identification of precipitates, their chemical composition and a description of the various morphologies observed. The main findings are discussed in terms of the thermal cycle associated with the weld simulation and the presence of strong carbide formers such as vanadium and niobium. (author).

2818 (CONF-891093--11) **Chemical cleaning of aluminum alloy surfaces for use as vacuum materials in synchrotron light sources.** Kaufherr, N.; Krauss, A.; Gruen, D.M.; Nielsen, R. Argonne National Lab., IL (USA). [1989]. 19p. Sponsored by U.S. DOE Energy Research. From 36. American Vacuum Society national vacuum symposium; Boston, MA (USA); 23-27 Oct 1989. Order Number DE90002859. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Photon and electron desorption from the vacuum chamber walls of electron storage rings such as the proposed Advanced Photon Source (APS), are sometimes responsible for the production of large gas loads during operation even in systems with very good static vacuum. The gas released by beam-induced desorption results in scattering of the beam electrons, and a consequent reduction in the beam lifetime. In extreme cases, the beam-induced outgassing may cause so much scattering that it is not possible to obtain the design goals with regard to obtainable beam current. Consequently, it is important that the surfaces which are exposed to the electron beam and photon fluxes contain as little trapped gas as possible, and that the gas burden during operation be kept as low as possible. The current study investigates the effectiveness of a chemical cleaning treatment developed at CERN for the LEP storage ring, as applied to the 6063 alloy to be used in APS. Additionally, depth profiling of the chemically cleaned samples and samples which were vapor-degreased only, provides new insight on the cleaning process as it applies to the alloy proposed for use in APS. 14 refs., 8 figs., 1 tab.

2819 (CONF-891117--8) **Spin dynamics of amorphous $Fe_{90-x}Ni_xZr_{10}$.** Fernandez-Baca, J.A.; Rhyne, J.J.; Fish, G.E.; Hennion, M.; Hennion, B. Oak Ridge National Lab., TN (USA). [1989]. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 34. conference on magnetism and magnetic materials; Boston, MA (USA); 28 Nov - 1 dec 1989. Order Number DE90002474. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Amorphous $Fe_{90-x}Ni_xZr_{10}$ is a system that exhibits a relatively high degree of magnetic exchange frustration, which becomes stronger as the system approaches the composition of amorphous pure iron. Thus, while samples with moderate amounts of iron ($x \geq 5$) are ferromagnetic, the samples with the highest concentration of iron ($x \leq 1$) behave like reentrant spin glasses. We have performed a detailed neutron scattering study of the spin-wave excitations in this system for x = 1, 5, 10, 20. In all cases well defined spin-wave excitations were observed below a transition temperature T_c that

decreased from 455 K (for x = 20) to 250 K (for x = 1). For x = 5, 10, 20 the spin-wave stiffness coefficient follows the temperature dependence expected for a conventional ferromagnet but the spin-wave excitations broaden considerably at low temperatures. For x = 1 the spin-wave stiffness coefficient softens at low temperatures and an elastic component of the scattering, associated with development of a spin glass order parameter, appears below $T \approx 0.28T_c$. A coexistence of propagating spin-wave excitations and spin freezing phenomena is observed below this temperature down to $T = 0.09T_c$. These results are discussed in terms of the relevant current theories. 30 refs., 5 figs., 1 tab.

2820 (CONF-8707219–1) **Engineering approaches to the application of fracture toughness data in the nuclear industry.** Merkle, J.G. Oak Ridge National Lab., TN (USA). [1989]. 11p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From Materials Properties Council workshop on scatter of fracture toughness data in the transition temperature regime; Boulder, CO (USA); 16 Jul 1987. Order Number DE90001596. Available from NTIS, PC A03/MF A01; OSTI; INIS.

The procedures for measuring the plane strain fracture toughness, K_{Ic}, of metals were originally developed for relatively high yield strength materials, the toughnesses of which were not affected by strain rate. The application of these procedures to lower yield strength and higher toughness structural and pressure vessel steels have since revealed a perplexing combination of problems involving the effects of geometry, stable crack growth and strain rate on the measured values of toughness. Only the geometric problems were encountered in the development of the procedures for measuring K_{Ic}. For fracture in the linear elastic range of the load-displacement curve, these problems were overcome by specifying specimen dimensions sufficiently large with respect to the plastic zone size at fracture. However, in the case of structural and pressure vessel steels, it is not always possible to test specimens large enough for fracture to occur prior to general yielding. Therefore, in these cases, the effects of large-scale yielding prior to fracture cannot be avoided, but since they presently have no analytical explanation they are being treated empirically. The problems of geometry and strain rate effects on toughness discussed herein are complex and difficult to solve. However, taking advantage of the improvements that have recently been made in the hardware and software available for performing three-dimensional elastic-plastic and viscoplastic stress analysis, it should be possible to significantly improve the analysis of small-specimen, elastic-plastic fracture toughness data.

2821 (CONF-8904290–1) **Elastic softening in nanocrystalline silicon.** Philipot, S.R.; Wolf, D.; Lutsko, J.F. Argonne National Lab., IL (USA). May 1989. 7p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Symposium J: interfaces between polymers, metals and ceramics; San Diego, CA (USA); 24-29 Apr 1989. Order Number DE90002268. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

It is pointed out that some of the generic physical properties of a nanocrystalline material are similar to those of a grain-boundary superlattice. The structure and elastic properties of a superlattice of twist boundaries on the (110) plane of silicon are calculated as a function of modulation wavelength using a three-body potential. All elastic moduli are found to be softened. This softening is attributed to the relatively small amount of structural disorder at the interfaces. 8 refs., 4 figs.

2822 (CONF-8905188–2) **Surface magneto-optical studies of ultrathin ferromagnetic films.** Liu, C.; Bader, S.D. Argonne National Lab., IL (USA). [1989]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Conference on magnetic properties of low-dimensional systems II; San Luis Potosi (Mexico); 22-26 May 1989. Order Number DE90002199. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The surface magneto-optic Kerr effect is used to study the existence of monolayer magnetism and the surface magnetic anisotropy of epitaxial films of Fe deposited on Cu(100), Ru(0001), and Pd(100). The critical behavior of Fe/Pd(100) is also characterized and found to be in agreement with 2-D Ising-model results.

2823 (CONF-8905239–1) **Quasicrystals and grain boundaries.** Rivier, N. Argonne National Lab., IL (USA). Jul 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 3. international meeting on quasicrystals: incommensurate structures in condensed matter; Vista Hermosa (Mexico); 29 May - 2 jun 1989. Order Number DE90002213. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Recent experimental and theoretical evidence suggests that grain boundaries are quasiperodic structures made of inflatable sequences of structural units. A general grain boundary is a grid of dislocations with the same inflation multiplier (a quadratic irrational) in every direction. Structural units are defined topologically as screw or edge dislocation lines on the boundary. Inflation is a geometrical and arithmetic operation expanding a finite sequence of topological units into a longer one. The structure has inflation symmetry if the same operation is repeated. Whereas inflation generalizes translation symmetry of classical crystallography, a direct product of inflatable sequences forms a tiling which realizes rotation symmetry. The two symmetries are compatible for only a few distinct patterns, up to affinities. Bulk quasicrystalline particles can grown on some grain boundaries, suggesting that quasicrystals are structures of minimal free energy under specific, but not common boundary conditions. 23 refs., 9 figs.

2824 (CONF-8906247–1) **Nanophase materials assembled from atomic clusters.** Siegel, R.W. Argonne National Lab., IL (USA). Sep 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From International symposium on physics of new materials; Osaka (Japan); 16 Jun 1989. Order Number DE90002204. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The preparation of atomic clusters of metals and ceramics by means of the gas-condensation method, followed by their in situ consolidation under high-vacuum conditions, has recently led to the synthesis of a new class of ultrafine-grained materials for which their physics is intimately coupled with their application. These nanophase materials, with 2 to 20 nm grain sizes, appear to have properties that are often rather different from conventional materials, and also processing characteristics that are greatly improved. The nanophase synthesis method described here should enable the design of materials heretofore unavailable, with improved or unique properties, based upon an understanding of the physics of these new materials. 23 refs., 8 figs.

2825 (CONF-8908175–1) **Embrittlement of laboratory- and reactor-aged CF-3, CF-8, and CF-8M duplex stainless steels.** Chung, H.M.; Leax, T.R. Argonne National Lab., IL (USA). Oct 1989. 30p. Sponsored by Nuclear Regulatory Commission. DOE Contract W-31109-ENG-38. From International workshop on intermediate-temperature embrittlement processes in duplex stainless steels; Oxford (UK); 1-2 Aug 1989. Order Number DE90002777. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Cast duplex stainless steels of CF-3, CF-8, and CF-8M grades, containing a wide range of chemical composition and ferrite content, were aged in the laboratory at 270 to 450°C to evaluate the kinetics and mechanisms of thermal-aging embrittlement. CF-8 and CF-8A steels were also obtained from components of BWRs and PWRs after service of 12 to 22 yr. After mechanical-property (i.e., Charpy impact, tensile, and J-R curve) and microhardness tests, the aged specimens were examined by transmission electron microscopy and field-ion atom-probe techniques to elucidate the aging mechanisms and identify critical factors that control the embrittlement kinetics. From the results of microstructural characterization, the primary and secondary embrittlement mechanisms were identified. A mechanistic correlation was obtained between the microstructural characteristics and the activation energy of aging (i.e., the temperature dependence of the aging kinetics) for steels with a range of chemical compositions and subjected to different fabrication and thermal-treatment conditions. The unified correlation, based on spinodal decomposition influenced by G-phase nucleation and growth in ferrite and $M_{23}C_6$ precipitation on ferrite-austenite boundaries, provides a good explanation of the complex behavior of the activation energy (ranging from 18 to 55 kcal/mole) regardless of grade, chemical composition, or fabrication process. 27 refs., 13 figs., 6 tabs.

2826 (CONF-8911114–1) **Effects of environmental variables on fatigue crack growth rate in steel immersed in seawater.** Ouchi, Hiroshi; Kobayashi, Jun-ichi. Nippon Steel Corp., Sagamihara, Kanagawa (Japan). [1989]. 9p. From EVALMAT '89: International conference on evaluation of materials performance in severe environments; Kobe (Japan); 20-23 Nov 1989. Order Number DE90002155. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

Effects of various environmental variables on the fatigue crack growth rate (FCGR) in a 660 MPa tensile strength steel were investigated. Applied potentials of −0.8 V and −0.6 V (vs SCE) and removals of dissolved oxygen and salts did not influence the FCGR in synthetic seawater. Increase of water contents accelerated FCGRs in alcohols. Acceleration of fatigue crack propagation was observed in several nonaqueous liquids. However, the FCGR in 1,1,2-trichloro-1,2,2-trifluoroethane was almost equal to that in air. Therefore, it was considered that the acceleration was not caused by corrosion reactions. Hydrogen atoms dissociated from water or other substances can cause the acceleration. 15 refs., 9 figs.

2827 (DOE/CE–0256-1) **Steel initiative: Development of superplastic steel processing: First annual progress report, March 15, 1988–March 15, 1989.** Sherman, D.H.; Leach, J.M.; Hayes, A.F.; Lemsky, J.A.; Thomas, J.D.; Geiger, G.H.; Goldberg, A.; Strum, M.J.; Sherby, O.D. USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (USA). Office of Industrial Programs. Sep 1989. 16p. Sponsored by U.S. DOE Conservation & Renewable Energy. Order Number DE90003277. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The influence of aluminum content and thermomechanical processing steps on developing fine microstructures in ultrahigh carbon steels (UHCS) was examined. The presence of aluminum results in ultrafine pearlitic structures without proeutectoid carbide networks, and greatly retards the eutectoid transformation kinetics. This retardation facilitates processing, which involves various combinations of DET and DETWAD steps. By applying the transformation kinetics as a guide, uniform through-thickness microstructures and superplastic properties are readily obtainable in thick sections. Superplasticity studies revealed that superplastic behavior is enhanced by aluminum additions and by increasing the amount of warm deformation during DETWAD processing. This trend is attributed to a decrease in ferrite grain size and an increase in the ferrite-grain-boundary angle, and hence, to an increase in the ease of grain-boundary sliding. Studies on the cold-rolling characteristics of a UHCS-Al alloy reveal that it can be cold-rolled to 50% in the fully pearlitic condition without annealing, and to over 60% in the fully spheroidized condition. Room-temperature tensile properties were obtained on DETWAD-processed material. Identical properties were obtained in the rolling and transverse directions, which is attributed to the ultrafine, isotropic microstructure. Two trial strand-casting runs were initiated. Modified Fe-C diagrams incorporating aluminum and/or silicon additions were constructed. Materials have been processed both at LLNL and at Ladish for evaluation of their die-filling capability.

2828 (DOE/ER/13277–T2) **Comprehensive characterization studies of sulfided molybdenum catalysts: Final progress report.** Massoth, F.E. Utah Univ., Salt Lake City, UT (USA). Dept. of Fuels Engineering. 17 Oct 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER13277. Order Number DE90002770. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objectives of this research were: to characterize a number of alumina-supported sulfided molybdena catalysts and determine hydrodesulfurization activity with the aim of relating catalytic activities to catalyst properties, viz., structure, dispersion, active sites of the active Mo phase; to determine the effect of various additives to the alumina support on the above; and to develop preparation techniques to achieve higher activity catalysts. This report reviews the progress made during the final reporting period.

2829 (DOE/ER/45182–5) **Investigation of fracture toughness and fracture mechanisms using acoustic emission measurements: Progress report, 1 March 1989–28 February 1990.** Carpenter, S.H. Denver Univ., CO (USA). Dept. of Physics. Oct 1988. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER45182. Order Number DE90002163. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The purpose of this report is to provide a presentation and discussion of results and goals accomplished to date on the research program "Investigation of Fracture Toughness and Fracture Mechanisms using Acoustic Emission Measurements." The time period for this report is 1 March 1989 through 28 February 1990, which corresponds with the second year of the program. The research program consists of three separate but closely related investigations. Both the effort expended and progress achieved have closely paralleled the plan laid out in the original proposal. For two of the investigations, ductile tearing/microvoid coalescence and influence of large changes in microstructure, the majority of the experimental work has been completed and a strong effort is now being directed towards analysis of the data which has been generated. It is projected that both of these investigations will be completed early in the third year of the program. The third investigation, second phase particles, is also well underway and should be completed by the end of the third year. A small effort studying cathodic charging of 304 stainless steel has been maintained. This work is essentially completed and will be written up and published soon. A more complete discussion of each of the separate investigations is provided below. 13 figs.

2830 (DOE/OR/21400–T401) **The optical properties of beryllium.** Arakawa, E.T.; Callcott, T.A.; Chang, Yun-Ching. Oak Ridge National Lab., TN (USA). [1989]. 31p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC05-84OR21400. 1855-1562-A1. Order Number DE90002720. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We review the published data on the optical properties of beryllium for the spectral region from 0.03 to 300 eV. In the visible and infrared spectral regions, where published data from various authors show very large variations, we have performed experiments that identify the most probable sources of error, and use this information to select the best data from published sources. The effects of surface oxide overlayers have also been studied. In the far infrared spectral region, where only normal incidence reflectance data are available, and in the extreme ultraviolet, where only transmission data are available, there is insufficient information to fully determine the optical properties at each photon energy. Between 0.06 and 26 eV, however, a normal incidence reflectance curve is fully determined. This curve has been used for a Kramers-Kronig analysis to determine the optical properties in this spectral range. 9 refs., 13 figs., 3 tabs.

2831 (EGG-M–37087) **Low cross-section Mo-Nb thermocouples for nuclear application: The state-of-the-art.** Wilkins, S.C. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 19p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-880122–24: 5. symposium on space nuclear power systems, Albuquerque, NM (USA), 11-14 Jan 1988). Order Number DE90002078. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Long-term high-temperature measurements in nuclear environments have long posed difficult problems. The tungsten-rhenium alloy thermocouples typically used in such applications undergo large decalibrations resulting from nuclear transmutation of the component materials. An alternative thermocouple, comprising pure molybdenum and niobium thermoelements, is virtually immune to transmutation effects, but is limited in utility by other properties. Thermocouples composed of molybdenum-niobium alloys show promise of significant improvement over the pure-metal combination. The W-Re decalibration problem is detailed and the status of Mo-Nb thermocouple development reviewed, including recent efforts at the Idaho National Engineering Laboratory. 18 refs., 4 figs.

2832 (EGG-M–88357) **The biocorrosion of copper by biopolymers as examined in situ, in real time FT-IR/CIR/ATR in conjunction with pre and post XPS/AES.** Gianotto, A.K.; Wichlacz, P.L.; Jolley, J.G.; Hankins, M.R.; Geesey, G.G.; Wright, R.B. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1989]. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-890238–5: Annual meeting and exhibit of the Society of Mining Engineers, Inc., Las Vegas, NV (USA), 27 Feb - 2 mar 1989). Order Number DE90002086. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Thin films of copper [2.0 nm on germanium internal reflection elements (IREs) and 3.4 nm on germanium discs] were exposed to 10% gum arabic (aqueous solution), 2% alginic acid (aqueous solution), 1% bacterial culture supernatant (BCS, simulated seawater solution) and 0.5% Pseudomonas atlantica exopolymer (simulated seawater solution). The IREs were monitored in situ, in real time using fourier transform infrared/cylindrical internal reflection/attenuated total reflection spectroscopy as a function of time at ambient conditions. The discs were characterized (pre- and post-exposure) by x-ray photoelectron and Auger electron spectroscopies. Ancillary graphite furnace atomic absorption spectroscopy was used to monitor the removal process of the copper thin film from the germanium substrates. Results indicate that Cu was oxidized by gum arabic, alginic acid and BCS. Furthermore, Cu was removed from the Cu/Ge interface by all four polymers. The Cu was found associated with the polymer solutions. 20 refs., 6 figs., 1 tab.

2833 (EGG-M–88501) **Experience with J testing of 304/308 stainless steel weldment.** Graham, S.M.; Lloyd, W.R.; Reuter, W.G. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1989]. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract AC07-76ID01570. (CONF-8911118–1: 2. symposium on user experience with elastic-plastic test methods, Orlando, FL (USA), 8-9 Nov 1989). Order Number DE90002046. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Crack initiation toughness tests were conducted using the J-Integral as a fracture characterizing parameter according to the ASTM Standard Test Method for J_{Ic}, A Measure of Fracture toughness, E813-87. The specimens were made from a weldment of 304 stainless steel (SS) base metal and 308 SS weld metal, and were fabricated such that the crack initiation toughness (J_{Ic}) of the weld metal could be measured. A peculiar feature of all of the tests was that crack growth occurred in an inverse tunneling mode. The provisional initiation toughness (J_Q) calculated from the test results were determined to be invalid because the validation requirements on change in crack front curvature and on accuracy of the predicted crack extension were not met. The accuracy of the predicted extensions was improved by applying correction factors to the measured compliances to account for crack front curvature, plastic deformation, friction, and indention. The excessive change in crack front curvature was caused by the transition from tunneling growth during fatigue precracking (before the specimens were side grooved) to inverse tunneling during slow stable crack growth. Crack growth by inverse tunneling may indicate a constraint condition higher than plane strain at the root of the side-grooves. If this is the case, the overall stress state is more severe than plane strain, and the measured initiation toughness should be a valid indication of the lower bound for high constraint. 9 refs., 11 figs.

2834 (EGG-M–89209) **Noncontacting laser ultrasonic generation and detection at the surface of molten metal.** Garcia, G.V.; Carlson, N.M.; Telschow, K.L.; Johnson, J.A. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC07-76ID01570. (CONF-890770–4: Conference on review of progress in quantitative NDE, Brunswick, ME (USA), 23-28 Jul 1989). Order Number DE90002020. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper describes proof of principle for using lasers to generate and detect ultrasound for the measurement of molten pool depth. Tin was chosen for these experiments because it has a low melting point and does not require any special equipment to produce a molten metal pool. To keep initial experiments simple, the depth of the molten pool was determined using a noncontacting sensor without any solid/liquid interfaces present. The results are compared to data available from experiments that used buffer rods to determine properties of molten tin. 5 refs., 6 figs.

2835 (GKSS–89/E/16) **The consideration of irradiation embrittlement of RPV steels in German licensing rules as compared to recent results of irradiation experiments.** Ahlf, J.; Bellmann, D.; Schmitt, F.J.; Pott, G. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). 1989. 12p. Available from Reprint from Nucl. Eng. Des. (Mar 1989) v. 112 p. 155-164.

After a brief outline of the consideration of irradiation embrittlement of RPV steels in the pertinent German KTA licensing rules, the prerequisites of the licensing procedure are identified and addressed in the light of recent results, mainly from the Research Program Safety of Components. It is stated that the $T_{41\ J}$ shift can be determined reliably and reproducibly and that measured shifts are conservatively predicted by the trend lines of KTA 3203. It is further shown that the $T_{41\ J}$ shift is generally greater than the T_{NDT} shift and that the measured reference temperature RT_{NDT} in the irradiated state compares reasonably well with the adjusted reference temperature RT_{NDT}. Experimental K_{Ic}/K_{Jc} values for two steels unirradiated and irradiated have been found to scatter largely but lie always far left from the corresponding lower bound K_{Ic} curves. Preliminary results and ongoing research programmes are briefly discussed with respect to the influence of neutron energy spectrum and flux density on embrittlement. (orig.).

2836 (INIS-BR–1689) **EVP2D- a computer code developed for the eslastoviscoplastic-damage analysis of axyssimetrical and two-dimensional problems.** Goncalves Filho, O.J.A. Instituto de Engenharia Nuclear, Rio de Janeiro, RJ (Brazil). Div. de Mecanica Estrutural. 1987. 4p. (In Portuguese). (CONF-871288–: 9. Brazilian congress of mechanical engineering, Florianopolis (Brazil), 7-11 Dec 1987). Order Number DE90607970. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

This work aims to describe the computer code EVP2D developed for the elastoviscoplastic-damage analysis of metallic components, with particular emphasis dedicated to the problem of creep damage and rupture. After a brief introduction of the basic concepts and procedures of Continuum Damage Mechanics, the constitutive equations implemented are presented. Next, the finite element approximation proposed for solution of the initial boundary value problem of interest is discussed, particularly the numerical algorithms used for time integration of the creep strain rate and damage rate equations, and the numerical procedures adopted for dealing with the presense of partially or fully ruptured finite elements in the mesh. As a pratical application, the rupture behaviour of a biaxially tension loaded plate containing a central circular hole is examined. Finally, future developments of the code, which include as priorities the treatment of ciyclic loads and the description of the anisotropic feature of creep damage evolution, are briefly introduced. (author).

2837 (INIS-BR–1765) **Study of niobium corrosion in alkaline medium.** Almeida, S.H. de. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1987. 151p. (In Portuguese). Order Number DE90607994. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

A comparative study of niobium electrochemical behaviour in NaOH and KOH solution, with concentrations between 0,5 and 6,1M is presented. The studies were done through electrochemicals assays, consisting in the corrosion potential and anodic and cathodic polarization curves, complemented by loss of mass experiments. The niobium anodic behaviour in alkaline medium is characterized by passivation occurrence, with a stable film formation. The Na oH solution in alkaline medium are more corrosible to niobium than the KOH solution. The loss of mass assays showed that the corrosion velocit is more dependente of hydroxide concentration in KOH medium than the NaOH medium. (C.G.C.).

2838 (JAERI-M–89-063) **Estimation of thermodynamic properties of alloys from phase diagram and other loose boundary conditions.** Ogawa, Toru; Iwai, Takashi. Japan Atomic Energy Research Inst., Tokyo (Japan). May 1989. 50p. (In Japanese). Order Number DE90719511. Available from NTIS (US Sales Only), PC A03/MF A01.

A set of computer programs has been made, which is used to predict thermodynamic properties of an alloy system from phase diagram and other loose boundary conditions. 'Loose' boundary conditions include fragmentary thermodynamic data and predictions based on several empirical or theoretical hypotheses. In program 'TOHSG', m equations with n ($m>n$) unknowns which are parameters concerning atomic interactions are assembled from the equilibria collected on experimental phase diagram, and also from the 'loose' boundary conditions. Then, the unknowns are obtained as Chebyshev solutions. Thermodynamic properties of the alloys are also calculated. In order to test their validity, the parameters are then fed into the other two programs 'TOGAP' and 'TOCOMP', which calculate the phase diagram. The set of programs can (1)

generate a working data set of a system whose thermodynamic properties are unknown, and (2) test various hypotheses against experimental data such as phase diagrams. As an example of application, U-Zr system has been analyzed. Source list of 'TOHSG' and input/output guides are attached. (author).

2839 (JYFL-RR-2/1987) **Hydrogen and helium in metals: positron lifetime experiments. Quarterly report 3. quarter 1987.** Rajainmaeki, Hannu. Jyvaeskylae Univ. (Finland). Dept. of Physics. Sep 1987. 61p. Order Number DE90008000. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

This thesis reviews a new approach to studying the role of hydrogen and helium in defect recovery of metals by the positron lifetime technique. A cryostat has been built at the University of Jyvaeskylae for irradiating and/or implaning solids by high-energy proton or helium beams from the MC-20 cyclotron. The samples can be kept continuously below 20 K and the isochronal annealings and the subsequent positron lifetime measurements are carried ou in the same cryostat after the irradiations. During the implantations below 20 K both impuities (H or He) and Frenkel pairs are produced simultaneously. By measuring positron lifetimes during the annealing detailed information is obtained about radiation damage, impurity-defect interactions, lattice defect annealing, void nucleation and formation of helium bubbles. In this work positron lifetime spectroscopy has been utilized for the first time to study defect recovery below the liquid nitrogen temperature (77 K). The annealing stages are investigated in aluminium, nickel and molybdenum in the temperature range 20-700 K. Hydrogen is found to get trapped at vacancies in all the studied metals with binding energies 0.53+-0.04 and 1.6+-0.1 eV, respectively. Trapped hydrogen retards the vacancy migration in Al and Mo, while H-vancancy pairs dissociate in Ni below the free vacancy migration stage. helium gets deeply trapped at vacancies in Al and migrates substitutionally with the activation energy of 1.3+-0.1 eV. Helium-vacancy pairs are observed to nucleate into clusters and form helium bubbles which are stable up to the Al melting temperature. The growth mechanisms for the bubbles are established as thermal vacancy absorption and bubble migration/coalescence.

2840 (LBL-27380) **Effects of precipitate distribution on 293 K and 77 K properties of 2090-T81 weldments.** Sunwoo, A.J.; Miyasato, S.; Morris, J.W. Jr. Lawrence Berkeley Lab., CA (USA). Jun 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890701-16: International cryogenic materials conference, Los Angeles, CA (USA), 24-28 Jul 1989). Order Number DE90002332. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Although 2090-T81 precipitation behavior has been well documented, the weld precipitation behavior has not been as-well characterized. The purpose of this study is to characterize the EB and GTA fusion zone precipitates and their distribution and to correlate the microstructure to 293 K and 77 K properties. The base metal strengths are greatly enhanced by a homogeneous distribution of T_1 precipitates at 293 K and 77 K, but the presence of T_1 and T_2 at the boundaries has an adverse effect on the elongation at 77 K. The weld strengths are limited by a lack of strengthening precipitates. Fusion zone embrittlement is caused by the formation of Cu-Fe containing film and strain localization at the dendrite boundaries. 14 refs.

2841 (LBL-27834) **Aspects of faceting in the study of percipitate interfaces.** Dahmen, U.; Witcomb, M.J.; Westmacott, K.H. Lawrence Berkeley Lab., CA (USA). Jul 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890977-2: International congress on intergranular and interphase boundaries in materials, Paris (France), 4-8 Sep 1989). Order Number DE90003113. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The role of faceting in the formation of interface structures between a precipitate and its matrix is considered and illustrated with TEM observations on a number of different alloy systems. Crystal symmetry and elastic constraints from the solid matrix are shown to be important factors in the development of morphologies and interfacial structures. 14 refs., 9 figs.

2842 (N-89-17298, pp. 289-298) **Anisotropic constitutive modeling for nickel base single crystal superalloy Rene N4 at 982 C.** Stouffer, D.C.; Jayaraman, N.; Sheh, M.Y.; Alden, D. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP-2493;E-3745;NAS-1.55:2493;CONF-8710466-: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

A back stress/drag stress constitutive model based on a crystallographic approach to model single crystal anisotropy is presented. Experimental results demonstrated the need for the back stress variable in the inelastic flow equations. Experimental findings suggested that back stress is orientation dependent and controls both strain hardening and recovery characteristics. Due to the observed stable fatigue loops at 1800 F, drag stress is considered constant for this temperature. The constitutive model operated with constraints determined only from tensile data was extensively tested from simple tensile and fatigue to complicated strain hold tests. The model predicted very well under those conditions.

2843 (N-89-17298, pp. 299-301) **Constitutive modelling of single crystal and directionally solidified superalloys.** Walker, K.P. (Connecticut Univ., Storrs (USA)); Jordan, E.H. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP-2493;E-3745;NAS-1.55:2493;CONF-8710466-: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

Successful attempts were made to model the deformation behavior of nickel base superalloys to be used in gas turbine engines based on both a macroscopic constitutive model and a micromechanical formulation based on crystallographic slip theory. These models were programmed as FORTRAN subroutines, are currently being used to simulate thermomechanical loading predictions expected at the fatigue critical locations on a single crystal turbine blade. Such analyses form a natural precursor to the application of life prediction methods to gas turbine airfoils.

2844 (N-89-17298, pp. 317-334) **Preliminary study of creep thresholds and thermomechanical response in Haynes 188 at temperatures in the range 649 to 871 C.** Ellis, J.R.; Bartolotta, P.A.; Mladsi, S.W. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP-2493;E-3745;NAS-1.55:2493;CONF-8710466-: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The following conclusions were drawn from this study of creep thresholds and thermomechanical response: (1) creep threshold can be determined using the latest electrohydraulic test equipment, providing that test durations are short and relatively large accumulations of creep strain are used in defining the threshold; (2) significant creep strains were measured under monotonic loading as stress levels as low as 4 ksi at temperatures predicted for solar receiver service; and (3) the material exhibited creep ratchetting during simulated service cycles, a result not predicted by analysis using current constitutive models for Haynes 188.

2845 (N-89-17298, pp. 401-412) **High temperature constitutive and crack initiation modeling of coated single crystal superalloys.** Meyer, T.G.; Nissley, D.M.; Swanson, G.A. National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center. Oct 1987. (NASA-CP-2493;E-3745;NAS-1.55:2493;CONF-8710466-: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The purpose of this program is to develop life prediction models for anisotropic materials used in gas turbine airfoils. In the base portion of the program, two coated single crystal alloys are being tested. They are PWA 286 overlay coated and PWA 273 aluminide coated PWA 1480 and PWA 286 overlay coated Alloy 185. Viscoplastic constitutive models for these materials are also being developed to predict the cyclic stress-strain histories required for life prediction of the lab specimens and actual airfoil designs.

2846 (N–89-17298, pp. 435-458) **Total strain version of strainrange partitioning for thermomechanical fatigue at low strains.** Halford, G.R.; Saltsman, J.F. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

A new method is proposed for characterizing and predicting the thermal fatigue behavior of materials. The method is based on three innovations in characterizing high temperature material behavior: (1) the bithermal concept of fatigue testing; (2) advanced, nonlinear, cyclic constitutive models; and (3) the total strain version of traditional strainrange partitioning.

2847 (PB–89-865075/XAB) **Tungsten and tungsten-alloy powder metallurgy: Powder production and applications-excluding lamps. November 1971-July 1989 (Citations from the US Patent data base). Report for November 1971-July 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 35p. Available from NTISPC N01/MF N01.

This bibliography contains citations of selected patents concerning the preparation of metallic and ceramic powders of tungsten and tungsten alloys including various applications of these materials. The hydrogen reduction of tungsten compounds together with alloying-element compounds produce forms with characteristics of high density, hardness, wear resistance, high melting points, and abrasiveness. Topics include production of various cathodes, heaters, filament wires, electrical contacts, acoustic absorbers, high-density sheets and coatings, hard penetrators, and tungsten carbide and metallized ceramics. Tungsten halogen lamps are examined in a separate bibliography. (Contains 60 citations fully indexed and including a title list.)

2848 (PB–89-871263/XAB) **Corrosion-resistant coatings. February 1983-September 1989 (Citations from the NTIS data base). Report for February 1983-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 203p. Available from NTISPC N01/MF N01.

Supersedes PB–88-852504.

This bibliography contains citations concerning the technology and applications of corrosion-resistant coatings. Among the coatings discussed are antifouling, antireflecting, plastic, ceramic and metal coatings. Applications include nuclear reactors and underwater equipment and materials. Military utilization is also included. (This updated bibliography contains 383 citations, 132 of which are new entries to the previous edition.)

2849 (PNL-SA–17443) **Acoustic emission during intergranular stress corrosion cracking.** Freisel, M.A.; Jones, R.H. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-890770–6: Conference on review of progress in quantitative NDE, Brunswick, ME (USA), 23-28 Jul 1989). Order Number DE90002894. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The physical and chemical processes taking place during intergranular stress corrosion cracking (IGSCC), in particular the effects of impurities on cracking mechanisms, have been the subjects of a research program sponsored by the Division of Materials Science, Office of Basic Energy Science, US Department of Energy at Pacific Northwest Laboratory (PNL), operated by Battelle Memorial Institute. Acoustic emission (AE) was brought into the program because of the unique ability of AE methods to detect dynamic microscopic fracture processes. In this paper, the results of these tests are presented. 7 refs., 6 figs., 3 tabs.

2850 (PPA-T–84) **Effect of heat treatment of toughness and strength properties of C-Mn steel.** Mohamad bin Harun; Goh Kian Seong; Yasmin binti Baba. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). [1989]. 11p. Order Number DE90607971. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The strength and toughness of the heat-treated and tempered C-Mn are studied. Two type of heat-treatments have been carried out with the specimens in an argon gas. The variation in the fracture surfaces of the heat-treated and tempered specimens with impact test temperatures also is discussed. (author).

2851 (PPLK-R–30) **Phase properties of the rapid cooled palladium-silicon alloy in the concentration range 40 to 58 at.% Si.** Tsumori, K.; Akimune, H. Kyoto Univ., Uji (Japan). Plasma Physics Lab. Oct 1988. 36p. Order Number DE90719525. Available from NTIS (US Sales Only), PC A03/MF A01.

The phase diagram for Pd-Si system is reinvestigated by thermal analysis with a method taking the second derivative of time dependent temperature and by metallographic measurement, where the cooling rate is about 140degC/min. The second derivative offers a sensitive and accurate means for the thermal analysis with aid of micro-computer. The intermetallic compound PdSi has no temperature peak in the phase diagram. In the Si concentration higher than 50 at.%, the alloy appears to be the eutectic for the constitutions of PdSi and Si, and the eutectic point locates at 895degC and 50 at.% of Si, and in the Si concentration lower than 50 at.%, the alloy appears to be the eutectic for the constitutions of Pd_2Si and PdSi, and the eutectic point locates at 886degC and about 48.5 at.% of Si. The phase properties appear to be largely affected by the phase stability of PdSi in company with the departure from thermal equilibrium in the thermal analysis. The addition of Ag impurity of small amount collapses PdSi phase and the alloy appears to be the eutectic for the constitutions of Pd_2Si and Si in the concentration range from Pd_2Si to Si. (author).

2852 (SAND–89-1665C) **Surface and bulk properties which influence ion-beam hydrogenation of silicon.** Anderson, R.A.; Seager, C.H. Sandia National Labs., Albuquerque, NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-891119–9: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE90003153. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The time evolution of dopant passivation in p and n-type silicon Schottky and MIS barriers has been investigated for low-energy H ions implanted directly into the silicon through a 400-Å front-electrode metallization. Knowledge of the dependence of the near-surface hydrogen concentration on time and experimental parameters is crucial to the analysis of these experiments. Hydrogenation effects are observed to vanish at ion energies below 800 eV, which suggests that the front electrode, rather than being a source of H, will behave as a sink for H diffusing in the silicon. Accordingly, we show that a steady-state H concentration proportional to the ion-deposition flux and deposition depth is established in a time interval less that a second near the electrode. Although some of the mobile H appears to be in a positively charged state, we calculate that the bias voltage applied to samples has only a small influence on the near-surface H concentration. An extensive study of the effects of sample temperature, beam flux, and ion energy supports these concepts and has revealed no evidence of ion-damage induced H trapping. The possible importance of H·H recombination of suggested by data obtained at the higher H concentrations. 4 refs., 4 figs.

2853 (SAND–89-1711C) **In-situ ion beam measurements of deuterium loading in thin foil electrochemical cells.** Knapp, J.A.; Guilinger, T.R.; Kelly, M.J.; Walsh, D.; Doyle, B.L. Sandia National Labs., Albuquerque, NM (USA). [1989]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-891119–8: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE90003162. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A key element of recent assertions of "cold fusion" has been the claim that electrochemical loading of deuterium into Pd electrodes can produce D:Pd levels exceeding 1:1. Using external beam nuclear reaction analysis of Pd foil electrodes in operating electrochemical cells, we have directly monitored deuterium content in-situ. No conditions were found which resulted in loadings higher than ~0.9. 15 refs., 5 figs.

2854 (SVF–339) **Sensitivity to hydrogen embrittlement in connection with cathodic protection of stainless duplex steels.** Henrikson, S. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). May 1989. 55p. (In Swedish). Order Number

DE90719409. Available from NTIS (US Sales Only), PC A04/MF A01.

Hydrogen embrittlement tests have been carried out at 25 deg C under cathodic protection in a water solution of 3.5% NaCl. The stainless steels 254 SMO (austenitic), MONIT (ferritic), SAF 2205 (ferritic-austenitic) and SAF 2507 (ferritic-austenitic) were studied. The primary aim of the investigation was an assessment of the hydrogen embrittlement susceptibility of the duplex steel SAF 2507 when used as tube material in cathodically protected seawater cooled heat exchangers. Two methods were used for the testing. The first was exposure of flattened tube specimens at various cathodic potentials. Titanium Grad 2 was also involved as a reference material in these tests. The second test method was SSRT-testing at a strain rate of 10^{-6}/s under cathodic protection and in air. The tests resulted in the following ranking of the materials regarding their susceptibility to hydrogen embrittlement: Least susceptible; * 254 SMO - no brittle fracture, * Titanium - no cracking probably due to surface hydriding, * SAF 2507 - inter- and transgranular cracking, * SAF 2205 - inter- and transgranular cracking. Most susceptible; * MONIT - intergranular cracking. Tests carried out with flattened tube specimens indicate that there is no risk of cracking by hydrogen embrittlement in tubes of the duplex steel SAF 2507 at cathodic protection of carbon steel parts (-800mV/SCE) of seawater cooled heat exchangers.

2855 (UCRL–98780) **Effects of nitrogen pulsing on sputter-deposited beryllium films.** Hsieh, E.J.; Price, C.W.; Pierce, E.L.; Wirtenson, G.R. Lawrence Livermore National Lab., CA (USA). 9 Aug 1989. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-891093–13: 36. American Vacuum Society national vacuum symposium, Boston, MA (USA), 23-27 Oct 1989). Order Number DE90003058. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Beryllium films have been used as a "heat sink" layer between the reflective coating of a mirror and its glass substrate to improve the mirror's radiation resistance to prompt deposition of x-rays. Under x-ray irradiation, the beryllium "heat sink" layer is subjected to tensile stresses caused by differences in thermal expansion coefficients. Test results indicated that the predominant failure mode was the film's crazing under tensile stress. The inherent columnar structure of the beryllium films deposited under normal conditions in detrimental to the tensile strength of the films and may be responsible for this type of failure. We successfully suppressed the inherent columnar growth in beryllium films by incorporating periodic N_2 pulses during sputter deposition. Quantitative analyses were conducted for nitrogen and oxygen contamination in the beryllium films using standards prepared by ion implantation. Secondary ion mass spectroscopy (SIMS) depth profiles were obtained for oxygen and nitrogen using mass isotopes ^{16}O and 23(^{9}Be + ^{14}N).

2856 (UCRL–100797) **Analyses of particles in beryllium by ion imaging.** Price, C.W.; Norberg, J.C. Lawrence Livermore National Lab., CA (USA). 6 Oct 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8909172–3: SIMS VII: 7th international conference on secondary ion mass spectrometry, Monterey, CA (USA), 3-8 Sep 1989). Order Number DE90001895. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Ion microanalysis using a $^{133}Cs^{+}$ primary ion beam and SIMS has sufficiently high sensitivity that it can be used to analyze Be for trace amounts of most elements. High sensitivity is important, because O, C, and other elements have low solubilities in Be, and reliable analyses of these elements becaome difficult as they approach their solid solubility limits (about 6 appm for O; C also is suspected to be within this range). Because of the low solubilities of these elements, major portions of their total concentrations can be contained in particles. Quantitative depth-profile analyses using ion-implanted standards are ideal to analyze the Be matrix, but if particles exist, supplementary techniques such as stereology are required to determine the amounts of the elements that are associated with the particles. This paper will demonstrate the use of ion imaging to identify various types of particles and determine their spatial distributions. 4 refs., 3 figs.

2857 **Fundamentals of beam-solid interactions and transient thermal processing.** Materials Research Society symposium proceedings. Volume 100. Aziz, M.J.; Rehn, L.E.; Stritzker, B. 763p. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes a line-source electron-beam system used to heat thin surface layers of metastable phases at a rate which precludes solid-state transformations to stable phases, thus permitting the observation of melting transitions normally missed with slow heating. A detailed example of a new approach to this method is shown for metastable icosahedral Al-Re and crystalline Al_6Re.

2858 **The projectile mass dependence of the amorphization process and the critical temperature in the ion irradiated CuTi.** Koike, J. (Northwestern Univ., Evanston, IL (US)); Meshii, M. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

CuTi was irradiated with 1MeV Ne^{+} and Kr^{+} at various temperatures in the Argonne-HVEM interfaced to a tandem accelerator. The integrated intensity of diffuse ring was measured by a microdensitometer and analyzed by Gibbons model for the dope dependence of the amorphous volume. The results are discussed in this paper. They indicate that the direct amorphization occurs in a single damage zone with Kr^{+}, but the overlapping of three damage zones is necessary with Ne^{+}. Using the present observations, the relation between the amorphization process and the critical temperature is discussed.

2859 **Ion-beam mixing and amorphization in Au/Zr bilayers.** Ding, F.R. (Argonne National Lab., Argonne, IL (US)); Okamoto, P.R.; Rehn, L.E. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract W-31-109-ENG-38. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes Au/Zr bilayer films with inert-gas markers produced by low energy ($\lesssim$4 KeV) implantation. Mass transport was measured during ion-beam mixing with 1 MeV Kr at several temperatures between 330 and 540K. Two distinct regimes of apparent Arrhenius behavior were found with activation enthalpies of 0.06 and 0.9 eV in the temperature range 330-440K and 460-540K, respectively. Microstructural changes during ion-beam mixing were studied in situ, in a high voltage electron microscope. Heterogeneous nucleation of an amorphous phase was observed during mixing. The results are compared with similar studies reported previously in Ni/Zr bilayer specimens.

2860 **Formation of metastable structures and amorphous phases in Cu-W alloys using the triode sputtering technique.** Rizzo, H.F. (Lawrence Livermore National Lab., Livermore, CA (US)); Tanner, L.E.; Wall, M.A.; Massalski, T.B.; McClanahan, E.D. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract W-7405-ENG-48. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes the triode sputtering technique and a "split-target" arrangement used to produce metastable crystalline and amorphous phases in the Cu-W system under essentially oxygen-free conditions. Large metastable extensions of solid solubility were observed both from the Cu (fcc) and W (bcc) sides of the phase diagram, and a wide range of metallic glass formation was observed, approximately between 30 and 65 at.%W. The thickness of the amorphous Cu-W phase (40-160 μm) that can be deposited without the formation of the metastable bcc phase appears to be dependent on the Cu-W alloy composition. On heating, the crystallization temperature of the amorphous alloys was higher than 350^{0}C. The behavior of the lattice parameter and near-neighbor distance has been studied with x-ray diffraction, showing small positive deviations from an assumed Vegard's Law. Hardness measurements indicate

that the metastable crystalline phases are relatively harder than the amorphous phase.

2861 Elastic instability during amorphization of intermetallic compounds by charged-particle beams. Okamoto, P.R. (Argonne National Lab., Argonne, IL (US)); Rehn, L.E.; Pearson, J.; Bhadra, R.; Grimsditch, M. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract W-31-109-ENG-38. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

Transmission electron microscopy (TEM) and Brillouin scattering methods were used to determine the lattice dilatation and shear elastic constant as a function of the degree of long-range order during room temperature irradiation of Zr_3Al with 1.0-MeV Kr^+. The results are described in this paper. It is shown that the volume dependence of the shear elastic constant associated with radiation-induced disordering and amorphization in virtually identical to that associated with the heating to melting of many metals.

2862 In situ ultrahigh vacuum friction measurement and wear track analysis of ion implanted 304 stainless steel. Pope, L.E. (Sandia National Labs., Albuquerque, NM (US)); Follstaedt, D.M.; Knapp, J.A.; Barbour, J.C. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper discusses the dual ion implantation of Ti and C into 304 stainless steel found to reduce friction and wear in ultrahigh vacuum (UHV). The implantation treatment producing this result, 4.6 x 10^{17} Ti/cm^2 (180 keV) followed by 2.0 x 10^{17} c/cm^2 (50 keV), produced TiC precipitates dispersed in an amorphous surface layer. Friction and wear track compositions were measured in situ with a scanning Auger microprobe without removing the pin from the track. This treatment is described.

2863 Characteristics of hydrogenated amorphous silicon-germanium alloys. Luft, W. (Solar Energy Research Inst., Golden, CO (USA)). pp. 1671 of Twentieth IEEE photovoltaic specialists conference, 1988. IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC02-83CH10093. (CONF-880965–: 20. IEEE photovoltaic specialists conference, Las Vegas, NV (USA), 26-30 Sep 1988).

In this paper literature data are summarized for hydrogenated amorphous silicon-germanium (a-SiGe:H and a-SiGe:H:F) alloys that show the relation between germanium content, hydrogen content, deposition methods, feed gas mixture, and other deposition parameters, and properties such as the optical band gap, dark and photoconductivities, photosensitivity, Urbach parameter, and spin density. Examining RF glow discharge with both a diode and a triode geometry, DC proximity glow discharge, and photo-CVD, using various hydrogen-diluted and undiluted gas mixtures, one observes that hydrogen (or inert gas) dilution is essential for obtaining high photosensitivity in SiGe alloys (in contradistinction to a-Si:H).

2864 Temperature dependence of Kr precipitation in Ni. Birtcher, R.C. (Materials Science Div., 9700 S. Cass Ave., Argonne National Lab., Argonne, IL (US)); Liu, A.S. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract W-31-109-ENG-38. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes a study of the precipitation of Kr injected into Ni at temperatures between 25 and 560 C with transmission electron microscopy. The Kr precipitates in cavities which increase in size with Kr fluence. Electron diffraction and dark-field imaging demonstrate that small Kr precipitates are solid, fcc crystals aligned with each other and the Ni lattice. The Kr is held in the solid state by the pressure generated by the cavity walls, and this pressure decreases with increasing cavity size. The mismatch between the Kr and Ni lattices is as large as 55%.

2865 Phase selection in undercooled liquids of pulsed-laser melted alloys. Follstaedt, D.M. (Sandia National Labs., Albuquerque, NM (US)); Peercy, P.S.; Perepezko, J.H. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper the use of thermodynamic analysis of phase relationships to identify metastable conditions for generating undercooled liquids by pulsed laser melting, and to interpret the resulting microstructures is illustrated from studies of Mn, FeV and TiAl. Phases with simple, disordered structures are found to nucleate and grow within tens of nanoseconds in liquids undercooled by 50-100 K. An extended transformation depth is found in which the stable high-temperature α phase replaces the metastable σ phase in FeV due to the heat release from the rapidly forming α phase.

2866 Excimer laser mixing of titanium layers on AISI 304 stainless steel. Jervis, T.R. (Los Alamos National Lab., Los Alamos, NM (US)); Nastasi, M.; Zocco, T.G. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract W-7405-ENG-36. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes excimer laser radiation to mix single layers of Ti directly on annealed substrates of 304 stainless steel. This process produces much thicker surface alloy layers and is much faster than ion mixing techniques. Liquid state diffusion results in mixed layers of the order of 1.0 μm thick from 0.5 μm Ti overlayers. In single pulse experiments, fluences of up to about 4 times melt threshold could be used before ablation occurred. The fluence in these experiments determines the melt duration and therefore the amount of mixing. Profiles of laser mixed surface layers and microstructural characterization of the layers are presented.

2867 Modeling of heat capacities of metals. Krikorian, O.H. (Lawrence Livermore National Lab., CA (USA)); Lai, D.Y. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 167: 167 (Sep 1989). DOE Contract W-7405-ENG-48. (CONF-8809145–: Thermodynamics of nuclear materials, Chicago, IL (USA), 27 Sep 1988).

Modeling methods are developed here to obtain a generalized approach across the periodic table for calculating C_p for the metallic elements. A Debye model is used for the harmonic lattice vibration contributions with the Debye temperature given by an expression of the form $\theta_D=\theta_0[1-\exp(-C_0/T)+\exp(-C_\infty/T)]$. Expressions are also developed to describe the temperature dependent behavior of the dilatation and electronic contributions to C_p. The average deviation between calculation and experiment is found to be +-1.6% for $C_{p,298}$ and +-1.0% for derived values S^0_{298}. (orig.).

2868 High-temperature interdiffusion and phase equilibria in U-Mo. Lundberg, L.B. (Los Alamos National Lab., NM (USA)). *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 167: 167 (Sep 1989). (CONF-8809145–: Thermodynamics of nuclear materials, Chicago, IL (USA), 27 Sep 1988).

Experimental data for interdiffusion and phase equilibria in the U-Mo system have been obtained over the temperature range 1400 to 1525 K from analysis of compatibility experiments in which UO_2 was decomposed by lithium in closed molybdenum capsules. Composition-position, X-ray diffraction, and microstructural data from the interdiffusion zones indicate that the intermediate phase U_2Mo is formed in the temperature range, contrary to prediction from the currently accepted equilibrium U-Mo phase diagram. The U-Mo interdiffusion data generally agree with published values. Inclusion of the U_2Mo phase in a theoretical correlation of interdiffusion and phase equilibria data using Darken's equation indicates that high-temperature interdiffusion of uranium and molybdenum proceeds under conditions of local thermodynamic equilibrium. Significant changes in the value of the thermodynamic-based Darken factor

near the U_2Mo phase boundary on the high uranium side are indicated from both the new and published interdiffusion data. (orig.).

2869 Evaluation and thermodynamic analysis of phase equilibria in the U-Al system. Kassner, M.E. (Lawrence Livermore National Lab., CA (USA)); Adler, P.H.; Adamson, M.G.; Peterson, D.E. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 167: 167 (Sep 1989). DOE Contract W-7405-ENG-48. (CONF-8809145–: Thermodynamics of nuclear materials, Chicago, IL (USA), 27 Sep 1988).

A reevaluation of phase equilibria in the binary U-Al system has been performed as part of the ASM-NBS Binary-Phase Diagram Evaluation Program. The resulting diagram includes several modifications to the recently assessed diagram by Chiotti et al. The current assessment also emphasizes the uranium-rich portion of the diagram. The consistency between available thermodynamic data for the system (Gibbs energies of formation of UAl_2, UAl_3, and UAl_4, and activity data for dilute solutions of uranium in liquid Al) and key points of the assessed diagram has been tested using the POTCOMP and FITBIN subroutines of the thermochemical computer code FACT. With the assumption of a regular solution model for Al-rich liquid, an ideal solution model for U-rich liquid, and Henrian models for U(β) and U(γ) solid solutions, there is reasonably good consistency between the thermo data and the assessed phase diagram. (orig.).

2870 Hydrogen effects in aluminum. Rozenak, P. (Negev Univ., Beersheba (Israel)); Siros, E.; Robertson, I.M.; Birnbaum, H.K.; Spooner, S. *Israel Journal of Technology (Israel),* 24(1-2): 183-189 (1988). (CONF-881206–: 4. Israel materials engineering conference, Beer-Sheva (Israel), 7-8 Dec 1988).

Secondary ion-mass spectrometry, small-angle X-ray scattering (SAXS), and TEM, are presently used to ascertain the effects of solute hydrogen in high purity Al. The distribution of deuterium at the surface of cathodically and chemically charged specimens produced deuterile profiles which do not agree with those calculated on the basis of diffusion data. The SAXS results have demonstrated that significant scattering is generated by the formation of clusters and small voids in the cathodically-charged Al. Anisotropic scattering was observed in the 110 and 111 line directions after cathodic charging; this, however, disppeared after aging. 16 refs.

2871 Kinetic paths of B2 and DO_3 order parameters: Theory. Anthony, L. (Department of Materials Science 138-78, California Institute of Technology, Pasadena, California 91125 (US)); Fultz, B. *Journal of Materials Research (USA),* 4(5): 1132-1139 (Sep 1989).

It is shown that a binary alloy with an AB_3 stoichiometry on a bcc lattice may develop various combinations of B2 and DO_3 order along its kinetic path toward equilibrium. The temporal evolution of these two order parameters is analyzed with an activated-state rate theory. Individual vacancy jumps are treated in a master equation formalism that involves first-nearest-neighbor (1nn) and second-nearest-neighbor (2nn) interactions. In our formulation, a set of coupled differential equations is obtained describing the time-dependence of six order parameters. These equations were integrated numerically for a variety of interatomic interactions and initial conditions. It was found that the *relative* rates of B2 and DO_3 ordering, and hence the path of the alloy through the space spanned by the B2 and DO_3 order parameters, depend on the relative strengths of the interatomic interaction potentials and on the temperature. For very strong 2nn interactions, a transient B32 structure was observed to develop at early times, although this phase disappeared as equilibrium was approached.

2872 Kinetic paths of B2 and DO_3 order parameters: Experiment. Anthony, L. (Department of Materials Science 138-78, California Institute of Technology, Pasadena, California 91125 (US)); Fultz, B. *Journal of Materials Research (USA),* 4(5): 1140-1142 (Sep 1989).

Rapidly quenched powders of Fe_3Al were subjected to thermal annealings at temperatures well below the critical temperatures for B2 and DO_3 ordering. X-ray diffractometry was used to measure the subsequent evolution of B2 and DO_3 long-range order. It was found that the relative rates of change of B2 and DO_3 order parameters were temperature dependent; hence at different temperatures the alloy passed through different states of order en route to thermal equilibrium. These temperature dependences of "kinetic paths" can be understood in terms of a theory of kinetic paths based on the kinetic master equation. The theory indicates that the temperature dependence of the observed kinetic paths originates from having first-nearest-neighbor interactions that are stronger than second-nearest-neighbor interactions. This seems consistent with previous thermodynamic analyses of critical temperatures of Fe_3Al.

2873 The dose, temperature, and projectile-mass dependence for irradiation-induced amorphization of CuTi. Koike, J. (Materials Science Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Okamoto, P.R.; Rehn, L.E.; Meshii, M. *Journal of Materials Research (USA),* 4(5): 1143-1150 (Sep 1989). DOE Contract W-31-109-ENG-38.

CuTi was irradiated with 1-MeV Ne^+, Kr^+, and Xe^+ in the temperature range from 150 to 563 K. The volume fraction of the amorphous phase produced during room temperature irradiation with Ne^+ and Kr^+ ions was determined as a function of ion dose from measurements of the integrated intensity of the diffuse ring in electron diffraction patterns. The results, analyzed by Gibbons' model, indicate that direct amorphization occurs along a single ion track with Kr^+, but the overlapping of three ion tracks is necessary for amorphization with Ne^+. The critical temperature for amorphization increases with increasing projectile mass from electron to Ne^+ to Kr^+. However, the critical temperatures for Kr^+ and Xe^+ irradiations were found to be identical, and very close to the thermal crystallization temperature of an amorphous zone embedded in the crystalline matrix. Using the present observations, relationships between the amorphization kinetics and the displacement density along the ion track, and between the critical temperature and the stability of the irradiation-induced damage, are discussed.

2874 Effect of chromium on properties of Fe_3Al. McKamey, C.G. (Metals and Ceramics Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6115 (US)); Horton, J.A.; Liu, C.T. *Journal of Materials Research (USA),* 4(5): 1156-1163 (Sep 1989). DOE Contract AC05-84OR21400.

The effects of the addition of chromium on several properties of Fe_3Al, including tensile strength and ductility, fracture behavior, and slip and dislocation characteristics, were studied. Alloying with up to 6 at.% chromium results in an increase in room temperature ductility from approximately 4% to 8–10%. Along with this increase in ductility, the addition of chromium produces a change in fracture mode from transgranular cleavage to a mixed mode of intergranular-transgranular cleavage, and a change in slip behavior from coarse straight slip to fine wavy slip. These phenomena are discussed in terms of the effect of chromium on the antiphase boundary energies and dislocation characteristics.

2875 Nucleation and propagation of cracks at grain boundaries in zinc bicrystals. Schmitz, H.A. (Department of Materials Science and Engineering, State University of New York at Stony Brook, Stony Brook, New York 11794 (US)); Dew-Hughes, D.; Bilello, J.C. *Journal of Materials Research (USA),* 4(5): 1182-1194 (Sep 1989).

A study has been made of fatigue and fracture in zinc bicrystals. It is shown that cleavage cracks are nucleated, both under tension and as a result of fatigue, in regions of multiple slip adjacent to grain boundaries at stresses below those for crack nucleation in single crystals. The nature of crack penetration through the boundary is observed as a function of orientation across the boundary. Low angle tilt boundaries are barriers to crack propagation, increasing effective surface energies for crack propagation by 1.6–2 times. Twist boundaries, due to the tearing that accompanies penetration, can result in a twelvefold increase in effective surface energy. Nonbasal cleavage is associated with a twinning mechanism, and an even higher surface energy is required to propagate a crack into a crystal oriented for this type of cleavage. The results carry the implication that, in the absence of surface defects, fatigue failure in polycrystalline zinc is nucleated at the first internal grain boundary and not at the surface.

2876 Analytic embedded atom method model for bcc metals. Johnson, R.A. (Materials Science Department, University of

Virginia, Charlottesville, Virginia 22901 (US)); Oh, D.J. *Journal of Materials Research (USA),* 4(5): 1195-1201 (Sep 1989).

The requirements for fitting bcc metals within the EAM format are discussed and, for comparative purposes, the EAM format is cast in a normalized form. A general embedding function is defined and an analytic first- and second-neighbor model is presented. The parameters in the model are determined from the cohesive energy, the equilibrium lattice constant, the three elastic constants, and the unrelaxed vacancy formation energy. Increasing the elastic constants, increasing the elastic anisotropy ratio, and decreasing the unrelaxed vacancy formation energy favor stability of a close-packed lattice over bcc. A stable bcc lattice relative to close packing is found for nine bcc metals, but this scheme cannot generate a model for Cr because the elastic constants of Cr require a negative curvature of the embedding function.

2877 **Theoretical study of noble-metal (100) surface reconstructions using first-principles techniques.** Takeuchi, N. (Ames Laboratory-U.S. Department of Energy, and Department of Physics, Iowa State University, Ames, Iowa 50011 (US)); Chan, C.T.; Ho, K.M. *Physical Review Letters (USA),* 63(12): 1273-1276 (18 Sep 1989). DOE Contract W-7405-ENG-82.

Using first-principles calculations, in conjunction with modeling techniques, we show that the top layer of the Au(100) surface will transform to a close-packed structure while that of Ag(100) will not. Our calculations provide some insight into the microscopic origin of the difference in stability between 4*d* and 5*d* fcc metal (100) surfaces.

2878 **Laser-induced interface reactions of copper thin films on sapphire substrates.** Godbole, M.J. (Department of Materials Science and Engineering, The University of Tennessee, Knoxville, Tennessee 37996-2200 (US)); Pedraza, A.J.; Lowndes, D.H.; Kenik, E.A. *Journal of Materials Research (USA),* 4(5): 1202-1208 (Sep 1989). DOE Contract AC05-84OR21400.

The interface of a copper-sapphire couple that was irradiated with a nanosecond pulsed-excimer laser was studied by transmission electron microscopy. Deposited layers of 30 or 100 nm thickness were laser treated with energy densities in the range of 0.5 to 0.75 J/cm^2. Two different atmospheres were used during these treatments, viz., air or a mixture of argon-4 vol.% hydrogen. The copper film and a thin alumina layer were melted by the laser pulse. Two well differentiated regions could be observed in the modified layer. The region closer to the unmodified substrate consisted of epitaxially regrown alumina with crystallites misoriented up to 10° relative to the substrate sapphire orientation, while precipitate particles could be seen closer to the resolidified copper. The nature of the precipitates generated in the second region was dependent on the atmosphere present during the treatment. In air a trirutile-like compound was obtained which is either oxygen or copper deficient. In an argon atmosphere a compound having a hexagonal structure closely related to sapphire was observed, where copper substituted for some aluminum. These observations are in agreement with a previously developed mathematical model that predicts melting of a thin substrate layer.

2879 **Optical second harmonic generation from Ni(110) with adsorbed CO.** Hamilton, J.C. (Sandia National Laboratories, Livermore, California 94551-0969 (US)); Anderson, R.J.M.; Williams, L.R. *Journal of Vacuum Science and Technology, B: Microelectronics Processing and Phenomena (USA),* 7(5): 1208-1211 (Sep 1989).

Optical second harmonic intensity from Ni(110) has been measured as a function of CO exposure, temperature, and excitation wavelength and compared with similar experiments on Ni(111). Second harmonic generation from Ni(110) is much weaker than from Ni(111); there is little or no azimuthal dependence of the second harmonic intensity; and the effect of CO on the second harmonic intensity is much less than for Ni(111). These observations are explained in terms of the unoccupied electronic levels of the two surfaces.

2880 **Comment on "Self-similarity of diffusion-limited aggregates and electrodeposition clusters".** Li, G. (Department of Physics, University of Michigan, Ann Arbor, Michigan 48109-1120 (US)); Sander, L.M.; Meakin, P. *Physical Review Letters (USA),* 63(12): 1322 (18 Sep 1989).

A Comment on the Letter by F. Argoul *et al.*, Phys. Rev. Lett. 61, 2558 (1989).

2881 **Anomalous local hopping of Sn impurities in lead.** Shechter, H. (Department of Physics and Solid State Institute, Technion, Haifa, Israel (IL)); Stern, E.A.; Yacoby, Y.; Brener, R.; Zhang, Z. *Physical Review Letters (USA),* 63(13): 1400-1403 (25 Sep 1989).

The Moessbauer spectral intensity of ^{119}Sn impurities in Pb with concentration of 5%, 2%, 1%, and 1/2% is measured as a function of temperature. A single narrow line is observed which slightly narrows as the temperature increases. Above a temperature $T_c \ll T_m$, the bulk melting temperature, the Moessbauer integrated intensity drops precipitously from a Debye-Waller behavior. Analysis of the results shows that a small region around each Sn atom is in a state of relatively large entropy, suggesting a local behavior more similar to a liquid than a solid.

2882 **Thermally and ion-induced phase formation in a Pd/Ge bilayer.** Li, J. (Department of Materials Science and Engineering, Cornell University, Ithaca, New York 14853 (US)); Hong, Q.Z.; Mayer, J.W. *Journal of Applied Physics (USA),* 66(8): 3600-3603 (15 Oct 1989).

Pd/Ge bilayer samples with three different overall compositions centered around Pd_2Ge have been thermally annealed or irradiated with 300 keV Kr ions at room temperature. We observed that the first phase formed with ion irradiation, as in thermal annealing is Pd_2Ge. In the $Pd_{75}Ge_{25}$ sample, the formation of an amorphous phase as well as the Pd_2Ge phase has been observed after 3×10^{15} Kr$^+$/cm^2 irradiation. Successive irradiations up to the 5×10^{15} Kr$^+$/cm^2 led to the demixing of this amorphous phase to Pd_2Ge and Pd.

2883 **Thermodynamic properties of fcc transition metals as calculated with the embedded-atom method.** Foiles, S.M. (Theoretical Division, Sandia National Laboratories, Livermore, California 94551 (US)); Adams, J.B. *Physical Review [Section] B: Condensed Matter (USA),* 39(9): 5909-5915 (15 Sep 1989).

Solid and liquid Gibbs free energies of Cu, Ag, Au, Ni, Pd, and Pt have been calculated through the use of the embedded-atom method, and the results are in good agreement with experiment. The melting points of the materials are calculated from the intersection of the solid and liquid free-energy curves. The values of the melting point are in excellent agreement for the noble metals and in reasonable agreement for Ni, Pd, and Pt. The thermal expansions of the solids are computed and the results are in excellent agreement with experiment over the entire temperature range.

2884 **Lattice dynamics of quenched diffuse ω phase in $Zr_{0.8}Nb_{0.2}$.** Noda, Y. (Faculty of Engineering Science, Osaka University, Toyonaka, Osaka 560, Japan (JP)); Yamada, Y.; Shapiro, S.M. *Physical Review [Section] B: Condensed Matter (USA),* 39(9): 5995-6002 (15 Sep 1989).

Phonon dispersion curves of the quenched diffuse ω phase of $Zr_{0.8}Nb_{0.2}$ have been measured along the [100], [001], [111], and [211] directions. Special attention was paid to the transverse-acoustic (TA) mode along the [211] and [011] directions in order to understand the structural and dynamical characteristics of the diffuse ω phase. In addition to the ordinary phonon branches, extra excitations forming subsidiary branches were observed for those TA modes, one of which had already been reported by Axe *et al.* In order to explain such anomalous behavior, we discuss the result in terms of the modulated lattice-relaxation model and the heterogeneous two-phase model.

2885 **Empirical electron-phonon coupling constants and anisotropic electrical resistivity in hcp metals.** Sanborn, B.A. (Department of Physics, State University of New York, Stony Brook, New York 11794-3800 (US)); Allen, P.B.; Papaconstantopoulos, D.A. *Physical Review [Section] B: Condensed Matter (USA),* 39(9): 6037-6044 (15 Sep 1989).

The Fermi-surface density of states $N(0)$ and Drude-plasma-frequency tensor $(\Omega_p{}^2)_{\alpha\beta} = 4\pi e^2 N(0)\langle v_\alpha v_\beta\rangle$ are calculated for 14 metallic elements with hcp structures. By comparison with measured anisotropic resistivity components $\rho_\perp$ and $\rho_\parallel$, electron-phonon coupling constants are extracted. The resulting values of λ_{tr} compare reasonably well with λ from T_c for the ten superconducting

elements and provide new information on electron-phonon coupling for the four that are not. In particular, λ_{tr} for Mg is sufficiently low as to discourage a further search for superconductivity, whereas λ_{tr} for Sc and Y is sufficiently high (0.5–0.6) to require spin-fluctuation suppression of T_c and motivate a low-T search for exotic superconductivity. Co is found to have very weak electron-phonon coupling in the majority-spin band and much stronger specific-heat enhancement in the minority-spin band. The anisotropy $\rho_{zz}/\rho_{xx}=\rho_{\parallel}/\rho_{\perp}$ is moderately well accounted for by the anisotropy of the Drude plasma frequency $(\Omega_p^2)_{xx}/(\Omega_p^2)_{zz}=\langle v_x^2\rangle/\langle v_z^2\rangle$, except for the *sp* elements, which have significant scattering anisotropy ($\lambda_{zz}/\lambda_{xx}\neq 1$). A systematic onset of "resistivity saturation" (signifying a breakdown of Boltzmann theory) is found when the mean free path $l\lesssim 10$ A. The onset occurs at a variable value $40<\rho<160$ $\mu\Omega$ cm.

2886 Detection of Alpher-Rubin attenuation and a search for nuclear acoustic resonance of surface waves in tantalum films. Spulak, R.G. Jr. (Sandia National Laboratories, Albuquerque, New Mexico 87185 (US)). *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6052-6057 (15 Sep 1989). DOE Contract AC04-76DP00789.

The first observation of Alpher-Rubin attenuation of surface acoustic waves is reported. The surface waves were propagated on an *ST*-cut quartz substrate, and absorption occurred in a 10-μm tantalum film due to the surface-wave-driven oscillation of conduction electrons in an external 24-kG magnetic field. A scaling law is derived that relates attenuation coefficients of bulk and surface waves. Unsuccessful searches were made for nuclear acoustic resonance (NAR) of surface waves due to electric quadrupole transitions of ^{181}Ta and magnetic dipole transitions of ^{1}H. Theoretical estimates of the attenuation of surface waves agree with the observed Alpher-Rubin effect and indicate that the NAR signal was less than the noise.

2887 Structural properties of liquid alkali-metal–lead alloys: NaPb, KPb, RbPb, and CsPb. Reijers, H.T.J. (Argonne National Laboratory, 9700 South Cass Avenue, Argonne, Illinois 60439 (US)); Saboungi, M.; Price, D.L.; Richardson, J.W. Jr.; Volin, K.J.; van der Lugt, W. *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6018-6029 (15 Sep 1989). DOE Contract W-31-109-ENG-38.

The structural properties of liquid equiatomic alkali-metal–lead alloys *A*Pb, with *A*=Na, K, Rb, and Cs, have been studied with neutron diffraction. The experimental data are reduced to the neutron-weighted total structure factors $S(Q)$ and radial distribution functions $n(r)$. In all the systems studied, $S(Q)$ is characterized by a first sharp diffraction peak (FSDP) at $Q\sim 1$ A^{-1} and $n(r)$ by structure in the first coordination shell at $r\approx 3$–4 A, both features indicating the presence of polyatomic structural units. Two types of structural models have been fitted to the experimental data, both based on consideration of such units: the random packing of structural units model, and the reference interaction site model. The structures of the units are derived from powder-diffraction measurements made with the same instrument on solid polycrystalline samples. Allowing for a slight expansion of the units on melting and using physically reasonable values for the adjustable parameters, both models give satisfactory agreement with the experimental data and are used to give the partial structure factors and pair distribution functions. Inelastic-scattering measurements have been made on one system, liquid KPb, using a spectrometer at the same source. These yield a value for the mean diffusion constant, $D=1.2\pm0.2\times10^{-5}$ cm^2/sec, and a smoothly varying inelastic scattering spectrum with no indication of excitations of a molecular character. The FSDP remains well defined when the inelastic scattering is integrated over small energy transfers, indicating a lifetime of 10^{-13} sec or longer for the intermediate-range order responsible for this peak.

2888 Anharmonic damping in rare-gas multilayers. Hall, B. (Department of Physics and The Institute for Surface and Interface Science, University of California, Irvine, Irvine, California 92717 (US)); Mills, D.L.; Zeppenfeld, P.; Kern, K.; Becher, U.; Comsa, G. *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6326-6338 (15 Sep 1989).

We have calculated the linewidths from anharmonic damping, for the phonon modes of rare-gas bilayers and trilayers adsorbed on the Pt(111) surface. This is done through use of perturbation theory, which in lowest order provides no damping for the monolayer vibration polarized normal to the surface. We also assume that the source of anharmonicity is the lateral interactions between adsorbates. We find linewidths in the range 0.1–0.2 meV at the temperature $T\approx 25$ K for all cases studied, save for the Ar bilayer, which is found to be more heavily damped. The results, supplemented by inclusion of radiative damping produced by coupling to substrate phonons, are compared with new experimental results for both the linewidth and dispersion of the normal modes of Ar, Kr, and Xe monolayers, bilayers, and trilayers adsorbed on the Pt(111) surface. The theoretical and experimental results are in good accord.

2889 First-principles total-energy calculations on Y and α-$YH_{0.5}$. Min, B.J. (Ames Laboratory, U. S. Department of Energy and Department of Physics, Iowa State University, Ames, Iowa 50011 (US)); Ho, K. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7532-7536 (15 Oct 1989). DOE Contract W-7405-ENG-82.

First-principles total-energy calculations have been performed for yttrium in the bcc, fcc, and hcp structures. The density of states at the Fermi energy, cohesive energy, equilibrium lattice constant, and bulk modulus of the ground-state hcp structure are obtained and compared with experimental results. Calculations are also carried out to investigate the lattice expansion and c/a ratio change with the addition of hydrogen.

2890 Distance of the image plane from metal surfaces. Smith, N.V. (AT&T Bell Laboratories, Murray Hill, New Jersey 07974 (US)); Chen, C.T.; Weinert, M. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7565-7573 (15 Oct 1989). DOE Contract AC02-76CH00016.

The data base of surface-state energies on the metals Cu, Ag, Au, Ni, Pd, and Pt is assembled and, with the aid of a simple model, is used to estimate the distance of the image plane and its trends from surface to surface and metal to metal. The model combines a nearly-free-electron representation of the crystal with a Jones-Jennings-Jepsen ansatz for the saturated image barrier. The projected bulk-band gaps are taken from published determinations. Constraints are placed on the surface barrier parameters by appeal to the results of self-consistent first-principles slab calculations. The general experimental trend observed is for the image-plane distance z_0 to decrease in the sequence (111) to (001) to (110), in the same sense but not as rapidly as z_J, the distance of the effective jellium edge. This trend is rationalized using a simple model of the tail of the surface charge density. Typical values for z_0-z_J fall in the range -0.2 to $+0.5$ a.u., with the larger values occurring for the 3*d* metals Cu and Ni.

2891 Photoemission study of formation and oxidation of a cerium-copper interface. Braaten, N.A. (University of Trondheim, Norges Tekniske Hogskole, N-7034 Trondheim, Norway (NO)); Grepstad, J.K.; Raaen, S. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7969-7972 (15 Oct 1989).

Deposition of Ce on a polycrystalline Cu film has been studied by x-ray photoelectron spectroscopy and ultraviolet photoelectron spectroscopy with use of synchrotron radiation. The formation of a relatively thick interface, >100 A, is observed at room temperature. The interface is found to contain about 80 at. % Ce and cannot be accounted for in terms of formation of an intermetallic compound based on the Ce-Cu phase diagram. A conversion from trivalent to tetravalent Ce ions is observed for a thin Ce-Cu interface when exposed to oxygen. The Cu substrate is not oxidized appreciably for oxygen exposures up to 1000 langmuir.

2892 Electronic origin of the intermediate phase of NiTi. Zhao, G. (Ames Laboratory-U.S. Department of Energy and Department of Physics, Iowa State University, Ames, Iowa 50011 (US)); Leung, T.C.; Harmon, B.N.; Keil, M.; Mullner, M.; Weber, W. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7999-8001 (15 Oct 1989).

A nesting feature in the Fermi surface of ordered, equiatomic NiTi is reported, and related to observed "premartensitic" phenomena.

2893 Scanning tunneling microscopy of orthorhombic TaS_3. Slough, C.G. (Department of Physics, University of Virginia,

Charlottesville, Virginia 22901 (US)); Coleman, R.V. *Physical Review [Section] B: Condensed Matter (USA),* 40(11): 8042-8044 (15 Oct 1989).

Scanning-tunneling-microscopy studies of orthorhombic TaS_3 at 77 K show a charge-density modulation of wavelength $4c_0$ strongly localized on two separate pairs of chains. The charge maxima are out of phase and suggest a strong coupling between the two charge modulations.

2894 **Patterson analysis of aperiodic crystals.** Ma, Y. (Department of Physics, University of Washington, Seattle, Washington 98195 (US)); Stern, E.A.; Li, X.; Janot, C. *Physical Review [Section] B: Condensed Matter (USA),* 40(11): 8053-8056 (15 Oct 1989).

Aspects of the Patterson-function (PF) analysis of the structure of aperiodic crystals are studied experimentally on icosahedral Al-Mn-Si and by computer simulation. In the icosahedral Al-Mn-Si system, a PF analysis using only the experimentally distinguishable peaks and neglecting the remaining background changes the two Mn-Mn distances of 4.6 and 5.0 A to a single 4.8 A distance. Computer simulations on one-dimensional (1D) and 2D models of aperiodic structures show that neglect of background in the PF analysis distorts disordered structures toward the quasicrystalline model, indicating that care should be exercised in drawing conclusions from the analysis of diffraction data.

2895 **Phonon dispersion measurements and first-principles calculations for the Au(110) surface.** Voigtlander, B. (Institut fur Grenzflachenforschung und Vakuumphysik, Kernforschungsanlage Julich GmbH, Postfach 1913, 5170 Julich, Federal Repubic of Germany (DE)); Lehwald, S.; Ibach, H.; Bohnen, K.P.; Ho, K.M. *Physical Review [Section] B: Condensed Matter (USA),* 40(11): 8068-8071 (15 Oct 1989).

We have measured the dispersion of surface phonons on the (1×2) reconstructed Au(110) surface along the high-symmetry directions using momentum resolved electron-energy-loss spectroscopy. The frequencies of surface modes at high-symmetry points of the surface Brillouin zone have been calculated with force constants determined from first-principles self-consistent total-energy calculations and are in excellent agreement with the experimental data. "Glue-model" calculations which predicted an experimentally not observed dipole active mode peeling off the top of the bulk phonon band seem to overestimate the bonding strength of atoms near the surface.

2896 **Chromium modified nickel-iron aluminide useful in sulfur bearing environments.** Cathcart, J.V.; Liu, C.T. To Dept. of Energy, Washington, DC. USA Patent 4,839,140. 13 Jun 1989. Filed date 31 Aug 1987. USA Patent Application 7,091,561. Int. Cl. C22C 19/05. 6p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes an improved nickel-iron aluminide containing chromium and molybdenum additions to improve resistance to sulfur attack. The corrosive effects of sulfur are discussed and the chemical composition of corrosion resistant alloys is illustrated.

2897 (AD-A–210197/0/XAB) **Processing and fabrication of high-temperature oxide superconductors. Annual report, 1 August 1988-30 June 1989.** Johnson, S.M. SRI International, Menlo Park, CA (USA). 7 Jul 1989. 15p. Available from NTIS, PC A03/MF A01.

During the past year, the author has been optimizing a process for synthesizing superconductor powders by freeze-drying. His objectives are to develop an understanding of the processing of these powders and to fabricate simple shapes from freeze-dried powders. He has synthesized a series of powders from solutions of barium acetate, copper nitrate, and yttrium nitrate, with pH values of 2.8 to 9.8 and calcined at temperatures from 510 to 908C. He is determining the surface area of these powders by BET AND XRD. Selected powders are being characterized by SEM, DTA, ICP analysis (performed at Stanford University), carbon analysis, and tap density. The highest surface area (in lightly milled powders) of 4.4 sq m/g was achieved with a pH of 4 in a series of experiments in which the Ba and Y solutions were mixed together before the Cu nitrate solution was added, then calcined at 825C. Surface areas decrease with increasing calcining temperature, however. It appears that calcining at 750 or 850 C gives the best critical temperature, with complete transitions at greater than 90K. Critical-temperature measurements performed at Stanford show that the author has achieved his goal of a critical temperature of 90K and a temperature difference, W, between 10% and 90% of transition of <2K.

2898 (AD-A–210781/1/XAB) **Plasma-activated ion-beam reactive sputtering of NbN thin films.** Lichtenwalner, D.J.; Anderson, A.C.; Rudman, D.A. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. 25 Nov 1988. 7p. (MS–8036). Available from NTIS, PC A02/MF A01.

Pub. in Materials Research Society Symposium Proceedings, Vol. 128, 67-72(1989).

In order to better study and control the processes occurring in a reactive sputtering situation, a unique deposition method was used in which the Ar-ion-beam sputtering of an elemental Nb target is combined with an auxillary Ar/N_2 plasma at the substrate. The ion source allows independent control of the sputtering parameters (ion flux, energy). The magnetically enhanced triode plasma provides a source of ionized and excited nitrogen at the film surface, and allows independent control of the substrate plasma parameters. A conductance-limiting enclosure surrounds the substrate, resulting in a pressure differential of nearly an order of magnitude between the substrate and target regions. This enables separation of the substrate and target-reaction regimes at low nitrogen flows. NbN was investigated because of its technological importance and the fact that it is representative of transition metal nitrides. With the substrate plasma off and N_2 provided at the substrate, the cubic superconducting NbN (delta phase) is produced even at low N_2 flows, when the target is in the unreacted, metallic state. Upon increasing the N_2 flow, the nitrogen content of the films abruptly increases as the target reaction proceeds. The addition of the substrate plasma results in the nonsuperconducting hexagonal delta phase, which to the authors knowledge has not previously been produced as a single-phase thin film. The electrical properties of the delta phase are reported.

2899 (AD-A–211070/8/XAB) **High-temperature ceramic superconductors. Annual technical report, 24 May 1988-30 June 1989.** Mazdiyasni, K.S. General Atomics, San Diego, CA (USA). 15 Jul 1989. 111p. (GA-A–19800). Available from NTIS, PC A06/MF A01.

The principal goals of this program are (1) to demonstrate fabrication of high-temperature ceramic superconductors via sol-gel methods that can operate at or above 90K with appropriate current density, in forms useful for application in resonant cavities, magnets, motors, sensors, computers, and other devices; and (2) to fabricate and demonstrate selected components made of these materials, including microwave cavities and magnetic shields. The chemical pathways for preparation of 123 powder, fiber, and film were identified.

2900 (AD-A–211249/8/XAB) **Continuous high-temperature lubrication of ceramics by carbon generated catalytically.** Lauer, J.L.; Dwyer, S.R. Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Mechanical Engineering, Aeronautical Engineering and Mechanics. Jun 1989. 7p. Available from NTIS, PC A02/MF A01.

Pub. in Materials Research Society Symposium Proceedings, Vol. 140, 363-368(Jun 1989).

A system for the continuous lubrication of ceramic surfaces at high temperatures by a carbon formed exclusively at the wear surfaces is described. The lubricant is delivered as a simple gas, ethylene, which is catalytically transformed. No reaction products are left which contain bearing surface material and the only nonvolatile product is lubricating carbon. One of the wearing surfaces must contain or have an overlay of nickel (about 1000 A thick in this work) and, preferably, a coating of nickel oxide on top to reduce nickel wear during startup. Since the carbon is formed only on nickel and the oxide is worn only in the wear track, only the wear track is lubricated. The laboratory system consisted of a sapphire pin on a nickel-coated rotating alumina disc. Ethylene was delivered

only to the conjunction region, which was surrounded by air. Contact pressures were about 200 MPa, linear speeds between 3 and 9 cm/sec. Friction coefficients dropped from 0.6 to 0.06 when ethylene was delivered to the contact at 500 C. Wear rates were not measureable under operating conditions. Gases other than ethylene and catalysts other than nickel will be explored in further work.

2901 (AD-A-211281/1/XAB) **Acoustic studies of new materials: Quasi crystals, low-loss glasses, and high tc superconductors. Annual summary report, 1 October 1988-30 September 1989.** Maynard, J.D. Pennsylvania State Univ., University Park, PA (USA). Dept. of Physics. 1 Aug 1989. 19p. Available from NTIS, PC A03/MF A01.

The goals of this project involve the development and application of new techniques in acoustics. The goals are: (a) to study the properties of single-crystal high-temperature superconductor oxide materials with ultrasonic measurements; (b) to study the properties of quasi crystals using ultrasound and acoustic analog systems; and (c) to develop and apply a new resonant photoacoustic technique to measure optical absorption in very low-loss glasses and crystals. Major accomplishments include the development of a new method of ultrasound measurement which permits the determination of all of the independent elastic constants of very small samples (a few hundred microns in size), and the development and test of a new technique for measuring optical absorption with more than an order-of-magnitude improvement in sensitivity over existing methods.

2902 (ANL/PPRNT–89-189) **Creep of chromia and yttria-doped chromia.** Dominguez-Rodriguez, A.; Goretta, K.C.; King, W.E.; Park, J.-H.; Routbort, J.L. Argonne National Lab., IL (USA). Nov 1987. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90003006. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Compressive creep tests of pure and Y-doped Cr_2O_3 at 1217°C have shown that the presence of Y increases diffusional flow rates substantially. It is inferred that this increase in deformation rate may account, in part, for the empirical fact that Y-containing scales adhere better to the underlying metal than pure scales do. 10 refs., 1 fig.

2903 (BNL–42550-Rev.) **Glancing angle x-ray studies of oxide films: Revision.** Davenport, A.J.; Isaacs, H.S. Brookhaven National Lab., Upton, NY (USA). 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016;AS05-80ER10742. (CONF-890960–1-Rev.: 6. international symposium on passivity: passivation of metals and semiconductors, Sapporo (Japan), 24-28 Sep 1989). Order Number DE90003261. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

High brightness synchrotron radiation incident at glancing angles has been used to study inhibiting species present in low concentrations in oxide films on aluminum. Glancing incident angle fluorescence measurements give surface-sensitive information on the valence state of elements from the shape of the x-ray absorption edge. Angle-resolved measurements show the depth distribution of the species present. 15 refs., 4 figs.

2904 (BNL–43373) **Phase separation of holes in antiferromagnets.** Emery, V.J.; Kivelson, S.A.; Lin, H.Q. Brookhaven National Lab., Upton, NY (USA). [1989]. 8p. Sponsored by U.S. DOE Energy Research; National Aeronautics and Space Administration; National Science Foundation. DOE Contract AC02-76CH00016. (CONF-890953–11: International conference on the physics of highly correlated electron systems, Santa Fe, NM (USA), 11-15 Sep 1989). Order Number DE90003255. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

It is shown that dilute holes in an antiferromagnet are unstable against phase separation into a hole-rich phase and a no-hole phase. When the spin exchange interaction J exceeds a critical value J_c, one phase consists of all holes, the other all electrons. The argument is presented in detail for the t–J model but evidence of phase separation in other models is mentioned. 11 refs.

2905 (CONF-890480–2) **Local atomic displacements in high T_c oxides studied by pulsed neutron scattering.** Egami, T.; Toby, B.H.; Dmowski, W.; Jorgensen, J.D.; Hinks, D.; Subramanian, M.A.; Gopalakrishnan, J.; Sleight, A.W.; Parise, J.B. Argonne National Lab., IL (USA). Jun 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Conference on oxygen disorder effects in high T_c superconductors; Trieste (Italy); 18-21 Apr 1989. Order Number DE90002217. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Various deviations from perfect periodicity in the atomic structure are found in real superconducting oxides, due to extrinsic defects such as oxygen vacancies, site occupation disorder, or twins. However, there are strong indications that these oxides also contain significant intrinsic disorder which may play a role in the superconductivity. A common indication of such disorder is a large "temperature factor", or the Debye-Waller factor, in the atomic structure which is often hardly dependent on temperature. By using the method of atomic pair distribution function (PDF) analysis of pulsed neutron powder diffraction data, we found in some oxides these large thermal factors are in fact due to local atomic displacements with only short range order. All elastic scattering intensities, including both the Bragg diffraction diffuse scattering intensities, are utilized in deriving the distribution of the atomic distances, or the PDF. Thus it is an ideal method to study a structure with short range order. We describe some of the results obtained by this method and discuss the effect of such a short range order on the superconductivity. 21 refs., 4 figs.

2906 (CONF-891036–2) **Solid lubrication of ceramic sufraces by IAD [ion-assisted deposition]-silver coatings for heat engine applications.** Erdemir, A.; Fenske, G.R.; Nichols, F.A.; Erck, R.A. Argonne National Lab., IL (USA). 1989. 31p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From Joint American Society of Mechanical Engineers/Society of Tribologists and Lubrication Engineers tribology conference; Ft. Lauderdale, FL (USA); 16-19 Oct 1989. Order Number DE90002860. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this study, an investigation was made of the tribological characteristics of alumina ceramics coated with silver by means of ion-assisted deposition (IAD). Tests were performed at temperatures up to 400°C on an oscillating-slider wear test machine capable of simulating the reciprocating motion of a ring/cylinder system. The results showed that higher test temperatures caused greater wear damage and increased friction for uncoated alumina. At 400°C, the wear rates of the alumina-alumina test pairs were 8 to 10 times higher than those tested at room temperature. The steady-state friction coefficients were also fairly high, typically ranging from 0.8 to 1.1. In contrast, the wear rate of IAD-silver coated flats was virtually zero and the wear rates of the counterface pins were reduced by a factor of 72. Friction was also reduced to about half to one third of those for the uncoated pairs. Surface and structure analytical investigations together with the hot-hardness testing of substrate alumina at temperatures up to 600°C were performed to ascertain the mechanisms responsible for the friction and wear behavior of both alumina-alumina and alumina-IAD-silver coated alumina pairs. 28 refs., 8 figs.

2907 (CONF-891119–4) **The effects of annealing on the structure and distribution of charge states of iron implanted into α-Al_2O_3 at 77 K.** McHargue, C.J.; Sklad, P.S.; McCallum, J.C.; White, C.W.; Perez, A.; Marest, G. Oak Ridge National Lab., TN (USA). [1989]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Materials Research Society fall meeting; Boston, MA (USA); 27 Nov - 2 dec 1989. Order Number DE90002929. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Implantation of iron into α-Al_2O_3 at 77 K produces an amorphous state for fluences greater than about 3×10^{16} Fe/cm^2. Iron in the as-implanted (amorphous) specimens is distributed among two Fe^{2+}, two Fe^{4+}, and the Fe^0 states. The conversion electron Moessbauer (CEMS) spectra for a sample containing 7×10^{16} Fe/cm^2 show all iron to be converted to Fe^{3+} after annealing in oxygen for 1 h at 700°C and above. The transmission electron microscopy (TEM) shows the structure to be mostly Y-Al_2O_3 after the 900°C anneal and all α-Al_2O_3 after the 1100°C anneal. 5 refs., 4 figs., 1 tab.

2908 (CONF-891119–6) **Structure of amorphous Al_2O_3 produced by ion implantation.** McHargue, C.J.; Sklad, P.S.; Angelini, P.; White, C.W.; McCallum, J.C.; Perez, A.; Marest, G. Oak

Ridge National Lab., TN (USA). [1989]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Materials Research Society fall meeting; Boston, MA (USA); 27 Nov - 2 dec 1989. Order Number DE90003065. Available from NTIS, PC A02/MF A01; OSTI; INIS.

The amorphous state can be produced in α-Al_2O_3 by ion beam induced displacements at 77 K or by displacements combined with chemical effects at room temperature. Progress toward understanding the amorphization process has been made from studies of the short-range order, electronic charge on implanted species, and the critical composition for amorphization. Results are presented for implantation of Al + O in the stoichiometric ratio, zirconium, iron, and tin. 10 refs., 6 figs.

2909 (CONF-8906119–4) **The effect of composition and processing on high T_c superconductors containing bismuth.** Nash, A.S.; Goretta, K.C.; Poeppel, R.B. Argonne National Lab., IL (USA). Jun 1989. 15p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From Powder metallurgy conference; San Diego, CA (USA); 11-14 Jun 1989. Order Number DE90002203. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The effect of doping and fabrication parameters on the transition temperature and structure of high-T_c Bi-Sr-Ca-Cu oxide superconducting compounds doped with silver and SnO_2 were studied. It was found that SnO_2 lowers the melting point of 4336 producing single-phase high-T_c superconductor at low levels of doping and firing temperatures, 750–825°C. The semiconducting behavior observed in samples fired at higher temperatures is attributed to the loss of oxygen in copper-oxide sheets. The effect of level of doping and firing temperature on T_c and structure of Bi-based superconductors beyond the range discussed in this paper are under further investigation.

2910 (CONF-8908133–7) **Nature of phonons, isotope effect, and superconductivity in $Ba_{1-x}K_xBiO_3$.** Degani, M.H.; Kalia, R.K.; Vashishta, P. Argonne National Lab., IL (USA). Oct 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 24. Yamada conference on strongly coupled plasma physics; Tokyo (Japan); 29 Aug - 2 sep 1989. Order Number DE90002778. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Phonon density-of-states of insulating $BaBiO_3$ in orthorhombic phase and superconducting $Ba_{0.6}K_{0.4}BiO_3$ in cubic phase are studied using the molecular dynamics (MD) method. The MD results are compared with the recent inelastic neutron scattering experiments and electron tunneling experiments. The exponent of the oxygen isotope effect is calculated from the first moment of the phonon density of states (the weak coupling limit) and from the solution of Eliashberg gap equations. Results are compared with isotope effect experiments. Evidence based on inelastic neutron scattering, tunneling, and isotope effect experiments when combined with the MD calculations suggest that this material is a normal weak coupling BCS superconductor with strong coupling of the carriers to the high energy oxygen phonons. 14 refs., 6 figs., 3 tabs.

2911 (CONF-8910120–1) **High-temperature corrosion of heat exchanger materials.** Federer, J.I. Oak Ridge National Lab., TN (USA). 1989. 29p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From 1. international ceramic science and technology congress; Anaheim, CA (USA); 31 Oct - 3 nov 1989. Order Number DE90001963. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Silicon-based and oxide ceramics are candidate matrix materials for ceramic composites for heat exchanger tubes and other critical applications. The corrosion behavior of matrix materials was investigated by exposure tests in industrial furnaces, and composites containing the most corrosion-resistant matrix materials were tested in laboratory furnaces. SiC and Si_3N_4 ceramics corroded severely in industrial furnace atmospheres containing alkali compounds. Oxide ceramics, such as Al_2O_3 and ZrO_2, corroded relatively little in the same atmospheres, but their corrosion increased with increasing SiO_2 content. Most ceramic composites containing hoop-wrapped continuous fiber in Al_2O_3 and stabilized ZrO_2 matrices exhibited dimensional instability during a laboratory corrosion test, but composites containing helical-wrapped fiber were stable. 6 refs., 12 figs., 3 tabs.

2912 (CONF-8910120–3) **Effect of gaseous corrosion on the strength of SiC and Si_3N_4.** Kim, Hyoun-Ee; Moorhead, A.J. Oak Ridge National Lab., TN (USA). [1989]. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 1. international ceramic science and technology congress; Anaheim, CA (USA); 31 Oct - 3 nov 1989. Order Number DE90002706. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The effects of gaseous corrosion on the room-temperature flexural strength of SiC and Si_3N_4 were investigated. Sintered α-SiC and hot-pressed Si_3N_4 were exposed to flowing H_2 or Ar at 1400°C for 10 h. The explored variables, water vapor pressure in the H_2 or oxygen partial pressure in the Ar, were found to significantly affect the corrosion of these materials. Reductions in room-temperature strength were observed when weight loss resulted from active oxidation, except for the Si_3N_4 exposed in Ar containing O_2. Large pits that formed during exposure were responsible for the strength reductions. When the P_{H_2O} in H_2 or P_{O_2} in Ar was high enough to form a thin oxide layer on the sample surface, the observed strength increased, ultimately to values greater than that of the as-polished material. However, under conditions in which a much thicker oxide layer was formed, the strengths were unaffected or decreased slightly, the latter being attributed to the generation of new flaws such as bubbles or cracks in the oxide layer. 34 refs., 8 figs.

2913 (CONF-8910248–1) **Numerical and empirical verification of the stress state in a ceramic, button-head, tensile specimen.** Jenkins, M.G.; Ferber, M.K.; Martin, R.L.; Poteat, R.M.; Tennery, V.J. Oak Ridge National Lab., TN (USA). [1989]. 34p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From Annual automotive technology development contractors coordination meeting; Dearborn, MI (USA); 23-26 Oct 1989. Order Number DE90001645. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Characterization of the mechanical properties of ceramics in uniform, uniaxial stress fields is of paramount importance to the successful implementation of sophisticated life prediction methodologies proposed for use in advanced ceramic designs. Recent increases in the use of tensile tests for structural ceramics, coupled with increasing ultimate strengths in these materials have revealed anomalies in the locations and circumstances of failures in the commonly-used button-head, tensile specimen (e.g., non-gage section fractures especially in the button-head area). The objective of this study was to numerically and empirically verify the stress-state in the ceramic, button-head tensile specimen as tested in conjunction with hydraulic couplers in the load train which have been reported to consistently hold bending strain errors to less than 1% at specimen failure. 6 refs., 4 figs.

2914 (CONF-8910273–1) **Anisotropy of oxygen tracer diffusion in $YBa_2Cu_3O_{7-\delta}$ single crystals.** Rothman, S.J.; Routbort, J.L.; Liu, J.-Z.; Downey, J.W.; Thompson, L.J.; Fang, Y.; Shi, D.; Baker, J.E.; Rice, J.P.; Ginsberg, D.M. Argonne National Lab., IL (USA). Sep 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Symposium on atomic migration and defects in materials; Indianapolis, IN (USA); 1-5 Oct 1989. Order Number DE90001931. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The crystal structure of $YBa_2Cu_3O_{7-\delta}$ strongly suggests that the diffusion of oxygen in this material will be highly anisotropic, with diffusion in the ab plane being much faster than diffusion parallel to the c axis, and this has been assumed in most analyses of diffusion in $YBa_2Cu_3O_{7-\delta}$. The present data confirm this hypothesis; the diffusion coefficient in the ab plane is several orders of magnitude greater than the diffusion coefficient along the c axis. Some interesting artifacts of the measurement, due to this strong anisotropy, are also revealed. Oxygen exchange in polycrystalline samples of $YBa_2Cu_3O_{7-\delta}$ is discussed in terms of these results. 15 refs., 9 figs.

2915 (EGG-M–89119) **Process monitoring using optical ultrasonic wave detection.** Telschow, K.L.; Walter, J.B.; Garcia, G.V.; Kunerth, D.C. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989.

7p. Sponsored by U.S. DOE Nuclear Energy; U.S. Department of the Interior. DOE Contract AC07-76ID01570. (CONF-890770--2: Conference on review of progress in quantitative NDE, Brunswick, ME (USA), 23-28 Jul 1989). Order Number DE90002021. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Optical ultrasonic wave detection techniques are being developed for process monitoring. An important limitation on optical techniques is that the material surface, in materials processing applications, is usually not a specular reflector and in many cases is totally diffusely reflecting. This severely degrades the light collected by the detection optics, greatly reducing the intensity and randomly scattering the phase of the reflected light. A confocal Fabry-Perot interferometer, which is sensitive to the Doppler frequency shift resulting from the surface motion and not to the phase of the collected light, is well suited to detecting ultrasonic waves in diffusely reflecting materials. This paper describes the application of this detector to the real-time monitoring of the sintering of ceramic materials. 8 refs., 5 figs.

2916 (EGG-M--89153) **Dissipation measurement in high T_c superconductors with electromagnetic probes.** Telschow, K.L.; O'Brien, T.K. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 8p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-890770--5: Conference on review of progress in quantitative NDE, Brunswick, ME (USA), 23-28 Jul 1989). Order Number DE90002058. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The new ceramic superconducting materials, which have transition temperatures above that of liquid nitrogen, have great potential. However, most fabrication schemes produce consolidated forms with relatively low critical currents; successful application of these materials requires a means of measuring their critical parameters (such as critical current) that can be used to monitor and control fabrication processes. This paper describes a technique for measuring the onset of dissipation in a superconducting coating in a local and noncontacting manner. This work begins the process of developing noncontacting techniques for the measurement of critical currents on a local scale with the capability of providing spatial information. 6 refs., 6 figs.

2917 (GAMI--90003256) **A global assessment of the business impacts of high transition temperature superconducting ceramic materials on permanent magnet producers, users, and raw materials suppliers 1987--2002.** Gorham Advanced Materials Inst., ME (USA). [1989]. 52p. Available from Gorham Advanced Materials Institute, P.O. Box 250, Gorham, Maine 04038.

This report is a global assessment of the business implications of ceramic high temperature superconductors on materials suppliers, producers, and users. (JEF)

2918 (IC--89/147) **Studies of the effect of age on the structure of polycrystalline ReO_3.** Majid, C.A. International Centre for Theoretical Physics, Trieste (Italy). Jun 1989. 7p. Order Number DE90608043. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Structural studies of polycrystalline $H_{0.57}$ ReO_3 grown with age of ReO_3 placed in air for 2 1/2 years, at normal room temperature conditions, are reported. 13 refs, 1 tab.

2919 (INIS-mf--12020) **Studies of the ternary phase diagram U-Pu-O between 1000 and 2000deg C. Structural and physico-chemical properties of $Pu_xU_yO_z$ mixed oxides with a view to applications as fuel.** Theissig, W.; Hellmann, H.; Hoffmann, G.; Feulner, H. Muenchen Univ. (Germany, F.R.). Inst. fuer Anorganische Chemie; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Dec 1987. 20p. (In German). Contract BMFT 02 U 5454. Order Number DE90722241. Available from NTIS (US Sales Only), PC A03/MF A01.

The employment of a high-temperature-diffractometer and of other high-temperature-equipment for the studies of the U-Pu-O system is described. The available equipment was found to be unsuitable for the purpose of this particular project. (orig.) With 11 refs., 2 tabs., 10 figs.

2920 (JAERI-M--89-094) **1MeV-electron irradiation induced defects in epitaxially grown 3C-SiC.** Itoh, Hisayoshi; Hayakawa, Naohiro; Nashiyama, Isamu; Sakuma, Eiichiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1989. 16p. Order Number DE90719574. Available from NTIS (US Sales Only), PC A03/MF A01.

Electron spin resonance (ESR) measurements have been performed for 1MeV-electron irradiated 3C-SiC crystals epitaxially grown by chemical vapor deposition method. The results indicate the presence of at least four paramagnetic defects (T1-T4 centers). The T1 center was found to consist of isotropic five lines equally spaced at about 1.5 G and to have a g-value of 2.0029+-0.0001. The anisotropic T2 center could be detected below about 100 K. The T3 and T4 centers were both anisotropic at room temperature. Isochronal annealing of electron irradiated 3C-SiC showed that the T1 center was annealed at three stages (150degC, 350degC, and 750degC) and that the T3 and T4 centers were annealed at 100degC and at 350degC respectively. (author).

2921 (LA-UR--89-3616) **Microwave characterization of high-temperature superconductors.** Cooke, D.W.; Gray, E.R.; Arendt, P.N.; Beery, J.G.; Bennett, B.L.; Brown, D.R.; Houlton, R.J.; Jahan, M.S.; Klapetzky, A.J.; Maez, M.A.; Raistrick, I.D.; Reeves, G.A.; Rusnak, B. Los Alamos National Lab., NM (USA). [1989]. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-891090--1: Conference on monitoring and control of plasma-enhanced processing and multichamber growth of semiconductors, Santa Clara, CA (USA), 8-13 Oct 1989). Order Number DE90002408. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Thick (10-15 μm) Tl-Ba-Ca-Cu-O films have been deposited onto yttria-stabilized zirconia and Ag substrates by d.c. magnetron sputtering techniques. Direct deposition onto 1" diameter yttria-stabilized zirconia yields films with typical 22 GHz surface resistance (R_s) values of 5.2 $\pm$ 2 mΩ and 52 $\pm$ 2 mΩ at 10 K and 77 K, respectively. For comparison, R_s of Cu at this same frequency is 10 mΩ at 4 K and 22 mΩ at 77 K. Tl-Ba-Ca-Cu-O films have also been deposited onto 1" diameter Ag substrates using Au/Cu, Cu, and BaF_2 buffer layers. The lowest R_s values were obtained on films with a BaF_2 buffer layer, typical values being 7.8 $\pm$ 2 mΩ and 30.6 $\pm$ 2 mΩ (measured at 22 GHz) at 10 K and 77 K, respectively. Larger films (1.5" diameter) with similar R_s values were prepared using this same technique, demonstrating that the fabrication process can be scaled to larger surface areas. These films are promising for radiofrequency cavity applications because they are thick (50-75 times the London penetration depth), have relatively large surface areas, are fabricated on metallic substrates, and have R_s values that are competitive with Cu at 77 K and are lower than Cu at 4 K. Because they are polycrystalline and unoriented, it is anticipated that their R_s values can be lowered by improving the processing technique. High-quality films of $YBa_2Cu_3O_7$ have been electron-beam deposited onto 1" $LaGaO_3$ and 1.5" $LaAlO_3$ substrates. The 1" sample is characterized by R_s values of 0.2 $\pm$ 0.1 mΩ at 4 K and 18.6 $\pm$ 2 mΩ at 77 K. The 4-K value is only 2-4 times higher than Nb. The 1.5" sample has R_s values (measured at 18 GHz) of 0.93 $\pm$ 2 mΩ and 71 $\pm$ 3 mΩ at 10 K and 77 K, respectively. 18 refs., 8 figs.

2922 (LA-UR--89-4011) **Microstructures of Y123 films on $SrTiO_3$, $LaGaO_3$ and $LaAlO_3$.** Roy, T.; Raistrick, I.D.; Mitchell, T.E. Los Alamos National Lab., NM (USA). [1989]. 5p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-7405-ENG-36. (CONF-891119--10: Materials Research Society fall meeting, Boston, MA (USA), 27 Nov - 2 dec 1989). Order Number DE90003367. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Transmission electron microscopy (TEM) and scanning electron microscopy (SEM) have been used to study the microstructural features of $YBa_2Cu_3O_7$ (hereafter referred to as Y123) films grown on various single crystal substrates by electron beam deposition. The films are all of high quality with the best observed J_c value being 3 $\times$ 10^7 A$\cdot$cm^{-2} at 7 K. Cross-sectional views in TEM have shown that the morphology of the film depends on its thickness. Thinner films (2500 Å) have a single layer of Y123 oriented with its c-axis perpendicular to the substrate while thicker films (8000 Å) have this same c-axis perpendicular layer closest to the interface with a c-axis parallel layer above it. The interface between the film and the substrate is well defined in all cases with no amorphous region at

the interface. Chemical analysis shows some inter-diffusion between the film and the substrate. 3 refs., 6 figs.

2923 (LBL–27657) **Electronic materials high-T_c superconductivity polymers and composites structural materials surface science and catalysts industry participation: Annual report, 1988.** Lawrence Berkeley Lab., CA (USA). [1988]. 190p. Sponsored by U.S. Department of Defense; U.S. DOE Conservation & Renewable Energy; U.S. DOE Energy Research; U.S. DOE Fossil Energy; Electric Power Research Institute; National Aeronautics and Space Administration; National Science Foundation. DOE Contract AC03-76SF00098. Order Number DE90002377. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The fifth year of the Center for Advanced Materials was marked primarily by the significant scientific accomplishments of the research programs. The Electronics Materials program continued its work on the growth and characterization of gallium arsenide crystals, and the development of theories to understand the nature and distribution of defects in the crystals. The High-T_cSuperconductivity Program continued to make significant contributions to the field in theoretical and experimental work on both bulk materials and thin films and devices. The Ceramic Processing group developed a new technique for cladding YBCO superconductors for high current applications in work with the Electric Power Research Institute. The Polymers and Composites program published a number of important studies involving atomistic simulations of polymer surfaces with excellent correlations to experimental results. The new Enzymatic Synthesis of Materials project produced its first fluorinated polymers and successfully began engineering enzymes designed for materials synthesis. The structural Materials Program continued work on novel alloys, development of processing methods for advanced ceramics, and characterization of mechanical properties of these materials, including the newly-documented characterization of cyclic fatigue-crack propagation behavior in toughened ceramics. Finally, the Surface Science and Catalysis program made significant contributions to the understanding of microporous catalysts and the nature of surface structures and interface compounds.

2924 (N–89-17298, pp. 357-368) **Thermal expansion mismatch and plasticity in thermal barrier coating.** Chang, G.C. (Cleveland State Univ., OH (USA)); Phucharoen, W.; Miller, R.A. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The basic objective of this investigation is the quantitative determination of stress states in a model thermal barrier coating (TBC) as it cools in the air to 600 C from an assumed stress-free state at 700 C. This model is intended to represent a thin plasma-sprayed zirconia-yttria ceramic layer with a nickel chromium-aluminum-yttrium bond coat on a cylindrical substrate made of nickel-based superalloys typically found in gas turbines.

2925 (N–89-17298, pp. 369-375) **Thermal barrier coating life-prediction model development.** Strangman, T.E.; Neumann, J.F.; Liu, A. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The primary objective of this program was to develop an operative thermal barrier coating (TBC) design model for life prediction. The objective was successfully accomplished with the development, calibration, and demonstration of a mechanistic thermochemical model which rapidly predicts TBC life as a function of engine, mission, and materials system parameters. This thermochemical design model accounts for the three operative TBC damage modes (bond coating oxidation, zirconia toughness reduction, and molten salt film damage), which all contribute to spalling of the insulating zirconia layer.

2926 (N–89-17298, pp. 377-393) **Thermal barrier coating life prediction model.** Pilsner, B.; Hillery, R.; Mcknight, R.L.; Cook, T.; Hartle, M. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objectives of this research were to determine the predominant modes of degradation of a plasma sprayed thermal barrier coating (TBC) system, and then to develop and verify life prediction models accounting for these degradation modes. The TBC system consists of a low pressure plasma sprayed (LPPS) bond coat layer of Ni-22Cr-10Al-O.3Y, an air plasma sprayed (APS) yttria partially stabilized zirconia (ZrO sub 2-8Y sub 2 O sub 3) top coat on a conventionally cast Rene 80 (Ni base) substrate. Thermal cycle testing of TBCs was employed to evaluate the effect of coating edges, bond coat oxidation, bond coat creep, top coat thickness, and bond coat thickness.

2927 (N–89-17298, pp. 385-399) **Thermal barrier coating life prediction model development.** Demasi, J.T.; Manning, S.L.; Ortiz, M.; Sheffler, K.D. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objectives of this program are to increase understanding of thermal barrier coating (TBC) degradation and failure modes, to generate quantitative ceramic failure life data under cyclic thermal conditions which simulate those encountered in gas turbine engine service, and to develop an analytical methodology for prediction of coating life in the engine. Observations of degradation and failure modes in plasma deposited ceramic indicate that spallation failure results from progressive cracking of the ceramic parallel to and adjacent to, but not coincident with the metal-ceramic interface.

2928 (N–89-27038) **Measurements of complex permittivity of microwave substrates in the 20 to 300 K temperature range from 26.5 to 40.0 GHz.** Miranda, F.A.; Gordon, W.L.; Heinen, V.O.; Ebihara, B.T.; Bhasin, K.B. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Jul 1989. 10p. (NASA-TM–102123;E–4903;NAS–1.15:102123;CONF-890701–: International cryogenic materials conference, Los Angeles, CA (USA), 24-28 Jul 1989). Available from NTIS, PC A02/MF A01.

A knowledge of the dielectric properties of microwave substrates at low temperatures is useful in the design of superconducting microwave circuits. Results are reported for a study of the complex permittivity of sapphire (Al_2O_3), magnesium oxide (MgO), silicon oxide (SiO_2), lanthanum aluminate ($LaAlO_3$), and zirconium oxide (ZrO_2), in the 20 to 300 Kelvin temperature range, at frequencies from 26.5 to 40.0 GHz. The values of the real and imaginary parts of the complex permittivity were obtained from the scattering parameters, which were measured using a HP-8510 automatic network analyzer. For these measurements, the samples were mounted on the cold head of a helium gas closed cycle refrigerator, in a specially designed vacuum chamber. An arrangement of wave guides, with mica windows, was used to connect the cooling system to the network analyzer. A decrease in the value of the real part of the complex permittivity of these substrates, with decreasing temperature, was observed. For MgO and Al_2O_3, the decrease from room temperature to 20 K was of 7 and 15 percent, respectively. For $LaAlO_3$, it decreased by 14%, for ZrO_2 by 15%, and for SiO_2 by 2%, in the above mentioned temperature range.

2929 (N–89-27836) **Ion beam and plasma methods of producing diamondlike carbon films.** Swec, D.M.; Mirtich, M.J.; Banks, B.A. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Aug 1988. 17p. (NASA-TM–102301;E–4980;NAS–1.15:102301;CONF-880887–: 32. international technical symposium on optical and opto-electronic applied science and engineering, San Diego, CA (USA), 14-19 Aug 1988). Available from NTIS, PC A03/MF A01.

A variety of plasma and ion beam techniques was employed to generate diamondlike carbon films. These methods included the use of RF sputtering, dc glow discharge, vacuum arc, plasma gun, ion beam sputtering, and both single and dual ion beam deposition. Since films were generated using a wide variety of techniques, the

physico-chemical properties of these films varied considerably. In general, these films had characteristics that were desirable in a number of applications. For example, the films generated using both single and dual ion beam systems were evaluated for applications including power electronics as insulated gates and protective coatings on transmitting windows. These films were impervious to reagents which dissolve graphitic and polymeric carbon structures. Nuclear reaction and combustion analysis indicated hydrogen to carbon ratios to be 1.00, which allowed the films to have good transmittance not only in the infrared, but also in the visible. Other evaluated properties of these films include band gap, resistivity, adherence, density, microhardness, and intrinsic stress. The results of these studies and those of the other techniques for depositing diamondlike carbon films are presented.

2930 (ORNL/FTR–3107) **[Ceramic powder processing]: Foreign trip report, October 7–15, 1988.** Crosbie, G.M. Oak Ridge National Lab., TN (USA). 31 Oct 1988. 37p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE90002139. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended and presented a technical paper at the Second International Powder Processing Conference and participated in the data analysis of the working group meeting of the International Energy Agreement Annex II. Of particular interest were discussions and papers about the status of German projects for Si_3N_4 powder characteristics for sinterability, tests relating Si_3N_4 ceramic properties to powder properties, and advances in understanding hardness of agglomerates and dry-pressing theory. These advances in ceramic technology are likely to be bases for improvements in several energy R&D activities. In the IEA meeting, the traveler presented a discussion of the X-ray diffraction methods which were used in Ford's contributions to the round robin. 8 refs., 9 figs.

2931 (ORNL/FTR–3445) **[Fabrication of superconducting films]: Foreign trip report, September 23, 1989–October 11, 1989.** Sekula, S.T. Oak Ridge National Lab., TN (USA). 26 Oct 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002153. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler visited the University of Cambridge and the associated Interdisciplinary Research Centre (IRC) on Superconductivity. The IRC is structured around collaborating departments within the university to establish a balanced program of basic research and work directed toward applications. At the International Conference on High-T_c Thin Films and Single Crystals, the traveler presented an invited paper and chaired a session on single-crystal growth. In roughly equal fractions, the papers at the conference were concerned with studies of thin-film and single crystals. Topics discussed included structural and superconducting characterization and potential device applications that are of interest to programs at ORNL. The traveler also visited the Institute of Physics in Warsaw and the Institute of Low Temperature and Structure Research in Wroclaw for discussions of current research in superconductivity.

2932 (PB–89-225700/XAB) **Resistivity measurements of superconducting materials. Master's thesis.** Akhtar, G. Quaid-i-Azam Univ., Islamabad (Pakistan). 1988. 139p. Available from NTIS, PC EE06/MF A01.

To study the electrical resistivity of high-temperature superconductors, a four-probe setup was constructed. Resistivity measurements as a function of temperature (77-300K) were studied for the systems R-Ba=Cu-O (R= Ho,Dy). The superconducting transition was observed for $DyBa_2Cu_3O_7$ and $HoBa_2Cu_3O_7$ around 90K.

2933 (PB–89-870570/XAB) **Sialon ceramics. January 1975-September 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 164p. Available from NTISPC N01/MF N01.

Supersedes PB–88-868674.

This bibliography contains citations concerning the properties, preparation, fabrication, testing, and applications of SIALON (SI–AL–O–N, the constituents) ceramics. Applications include utilization in gas-turbine components, cutting tools, heat exchangers, and other high-temperature/high-stress components. Sintering methods and materials, and microstructural analyses are discussed. Japanese research and development is included. (This updated bibliography contains 282 citations, 23 of which are new entries to the previous edition.)

2934 (UCRL-Trans–12253) **Structure of niobium carbides.** (Structure des carbures de niobium). Terao, Nobuzo. 18p. Translated from Japanese Journal of Applied Physics (Japan). *Japanese Journal of Applied Physics (Japan),* 3(2): 104-111 (Feb 1964). Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48.

The preparation of thin films of two niobium carbides, NbC and Nb_2C, for electron diffraction studies has been accomplished by heating in vacuo double evaporated films (carbon + Nb). NbC is formed by a carburization process in high vacuum, while thin films of Nb_2C are produced by decomposition of NbC in air at reduced pressure ($10^{-2} \sim 10^{-3}$ Torr) by the reaction $2\ NbV + O_2 \rightarrow Nb_2C + CO_2$. The crystal structure of NbC is based on the f.c.c. lattice of Nb atoms and the carbon atoms occupy interstitial positions in a statistical manner. Nb_2C, however, shows a hexagonal superlattice structure of the same type as that of ε-phase of Fe_2N. 2 figs., 2 tabs.

2935 High resolution electron microscopic study of the growth of denser phases on zeolite Y and zeolite L. Zandbergen, H.W. (National Center for Electron Microscopy, Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). vp of Microstructure and properties of catalysts. Treach, M.M.J.; Thomas, J.M.; White, J.M. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711205–: Symposium on microstructure and properties of catalysts, Boston, MA (USA), 30 Nov - 3 dec 1987).

High resolution electron microscopy (HREM) is a powerful tool in materials research. This is especially true in the study of zeolites because most of the questions concerning the properties of zeolites require a detailed characterization of the local structure. In this paper the potential of HREM is illustrated with studies on the growth of denser phases on Zeolite Y and Zeolite L.

2936 The charge state of iron ions implanted into sapphire. McHargue, C.J. (Oak Ridge National Lab., Oak Ridge, TN (US)); Sklad, P.S.; White, C.W.; Farlow, G.C.; Perez, A.; Kornilios, N.; Marest, G. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

Single crystals of α-Al_2O_3 were implanted with $^{57}Fe^+$ at room temperature to fluences ranging from 10^{16} to 10^{17} ions/cm^2. This paper discusses the damage in the implanted zone and the valence states and local environment of implanted ions studied by transmission electron microscopy, Rutherford backscattering-channelling, and conversion electron Mossbauer spectroscopy. The implanted iron was distributed among the three charge states Fe^{2+}, Fe^{3+}, and Fe^0 (metallic clusters) with the relative amount of each varying with concentration of implanted iron.

2937 Lattice mode study of La_2CuO_{4-y} implanted with Sr. Ohana, I. (Massachusetts Institute of Technology, Cambridge, MA (US)); Doll, G.L.; Lusnikov, A.; Dresselhaus, M.S.; Withrow, S.P.; Picone, P.J.; Jenssen, H.P.; Gabbe, D.R.; Dresselhaus, G. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper dramatic implantation-induced changes in the Raman and infrared spectra of polycrystalline samples of La_2CuO_{4-y} are reported for implantation of Sr in the fluence range 0.5 to 1.5 $X10^{16}$/cm^2. The Raman and ir-reflectance spectra of the Sr implanted material reveal disorder-induced lines corresponding to breakdown of selection rules and to non-zone-center phonon modes. Whereas the main features in the Raman spectra of the implanted sample are broad disorder-induced lines centered at –

560+-5 cm^{-1}, reststrahlen lineshapes are observed above – 800 cm^{-1} in the ir-reflectance spectra. After thermal annealing (550°C), the multiphonon lines in the ir spectra diminish, and the disorder-induced lines in the Raman spectra split to form well-resolved, sharper lines at 530 and 580 cm^{-1}, identified with maxima in the phonon density of states.

2938 Synthesis of oxide powders by plasma vaporization of solutions. Pollinger, J.P. (Pennsylvania State Univ., Univ. Pk., PA); Messing, G.L. vp of Ceramic powder science. Messing, G.L.; McCauley, J.W.; Mazdiyasni, K.S.; Haber, R.A American Ceramic Society Inc., Westerville, OK (1987). (CONF-860883–: Ceramic powder science and technology: synthesis, processing, and characterization conference, Boston, MA (USA), 3-6 Aug 1986).

The synthesis of single and multicomponent oxide powders by the plasma vaporization of solutions (PVS) technique is reviewed. Previous investigations of the synthesis of MgO, Al_2O_3, Fe_2O_3, ZrO_2, and SiO_2-ZrO_2 powders are discussed, as well as the results of recent experiments in the laboratory on the effect of precursor composition on the morphology, structure, composition, and particle-size distribution on PVS-synthesized MgO, Al_2O_3, and Al_2O_3-MgO powders.

2939 Plasma synthesis and characterization of ultrafine SIC. Vogt, G.J. (Los Alamos Nat. Lab., Los Alamos, NM); Phillips, D.S.; Taylor, T.N. vp of Ceramic powder science. Messing, G.L.; McCauley, J.W.; Mazdiyasni, K.S.; Haber, R.A American Ceramic Society Inc., Westerville, OK (1987). (CONF-860883–: Ceramic powder science and technology: synthesis, processing, and characterization conference, Boston, MA (USA), 3-6 Aug 1986).

Ultrafine SiC powders were prepared by gas-phase synthesis from silane and methane in an argon thermal rf-plasma. Bulk properties of the powders were determined by elemental analysis, X-ray diffraction, helium pycnometry, and BET surface area measurements. The near-surface composition and structure of the particles were examined by X-ray photoelectron spectroscopy (XPS) and transmission electron microscopy (TEM). In addition to free silicon and carbon particles in the powders, free carbon and various silicon/carbon/oxygen species were found on the surface of the SiC particles. The presence of these surface species will dominate the powder surface chemistry, having important implications for powder processing and consolidation.

2940 Optical waveguide formation by ion implantation of Ti or Ag. Poker, D.B. (Oak Ridge National Lab., Oak Ridge, TN (US)); Thomas, D.K. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper ion implantation of Ti into $LiNbO_3$ is shown to be an effective means of producing optical waveguides, while maintaining better control over the resulting concentration profile of the dopant than can be achieved by in-diffusion. While undoped, amorphous $LiNbO_3$ can be regrown by solid-phase epitaxy at 400°C with a regrowth velocity of 250 A/min, the higher concentrations of Ti required to form a waveguide (–10%) slow the regrowth considerably, so that temperatures approaching 800°C are used. The regrowth is completed at 400°C, and annealing of all residual damage occurs at or below 800°C. Furthermore, the regrowth rate is independent of Ag concentration up to the highest dose implanted to data. The usefulness of Ag implantation for the formation of optical waveguides is discussed.

2941 A cross-sectional TEM study of the effects of annealing conditions on the regrowth of lead-implanted single crystal calcium titanate. Rankin, J. (Massachusetts Institute of Technology, Cambridge, MA (US)); Hobbs, L.W.; Boatner, L.A.; White, C.W. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400;FG02-84ER45090. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes the study of the atmospheric effects of oxygen and water vapor on the epitaxial regrowth behavior or ion-implanted $CaTiO_3$. Cross-sectional transmission electron microscopy (TEM) samples prepared from crystals implanted with $1(10^{15})$ Pb/cm^2 at 540 KeV, were annealed at 450-650°C for 40 - 80 minutes, in environments containing different percentages of oxygen and water vapor. Regrowth was studied for implantation directions along both the <010> and <100> crystallographic directions of this orthorhombic Perovskite structure, space group Pcmn. TEM on unannealed crystals indicated the presence of an amorphous region.

2942 Dispersion and rheology in ceramic processing. Sacks, M.D. (Univ. of Florida, Gainesville, FL); Khadilkar, C.S.; Scheiffele, G.W.; Shenoy, A.V.; Dow, J.H.; Sheu, R.S. vp of Ceramic powder science. Messing, G.L.; McCauley, J.W.; Mazdiyasni, K.S.; Haber, R.A American Ceramic Society Inc., Westerville, OK (1987). (CONF-860883–: Ceramic powder science and technology: synthesis, processing, and characterization conference, Boston, MA (USA), 3-6 Aug 1986).

Rheology plays an important role in most aspects of ceramic processing, including performing operations(e.g., mixing, milling, etc.), shape-forming operations (e.g., slip casting, tape casting, injection molding, extrusion, fiber drawing, spray granulation, etc.), coating (deposition processes (e.g., dipping, spinning, spraying, etc.), and drying (e.g., liquid transport in pores) and densification (e.g., liquid-phase sintering). Proper control over rheological properties is important, not only to maximize processing efficiency, but also to optimize the physical properties of the processed materials. In particle/liquid systems, rheological properties are especially sensitive to the state of particulate dispersion. Well-dispersed systems, in which primary particles are well separated in the liquid medium, are generally desirable in suspension-forming operations (e.g., slip casting, tape casting, etc.). In this paper, some of the important factors affecting the state of dispersion in particle/liquid systems are discussed in the context of several illustrative examples. The utility of rheological measurements in characterizing the state dispersion and optimizing processing conditions is demonstrated.

2943 Pulsed laser mixing of metal overlayers on ceramics. Singh, R.K. (North Carolina State Univ., Raleigh, NC (US)); Biunno, N.; Narayan, J. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes pulsed laser mixing used as surface modification technique for the improvement in the mechanical properties of ceramics. Thin metallic layers of nickel were deposited on structural silicon nitride and were irradiated with Xenon Chloride (XeCl) laser pulses. The laser parameters were optimized to lead to the formation of mixed layers. The mixed interfacial layers were analyzed using Scanning Electron Microscopy (SEM), Transmission Electron Microscopy (TEM) and Rutherford Backscattering (RBS) techniques.

2944 Microwave cavity studies for thermal testing of ceramic breeder materials. Kustom, R. (Argonne National Lab., Argonne, IL 60439 (USA)). vp of Proceedings of the 12th symposium on fusion engineering. IEEE Service Center, Piscataway, NJ (1987). DOE Contract W-31-109-ENG-38. (CONF-871007–: 12. symposium on fusion engineering, Monterey, CA (USA), 12-16 Oct 1987).

Dielectric heating of proposed ceramic tritium breeder material to study the thermomechanical and thermal-hydraulic properties of the material has been previously suggested. Recent computer studies using codes capable of modelling three-dimensional EM cavities with enclosed dielectric material have been used to determine the size limitations of cavity designs at 200MHz. The sample can be as large as 0.44 x 0.72 m in the plane that is transverse to the direction of neutron flux. The uniformity of volumetric heating over the transverse plane is constant to within a few percent. The sample can be as long as 10 cm in the direction of the heat flux and match the expected exponential decay of heat generation, $\exp(-z/\lambda)$, to within +-8%. The design of the chamber is described, including the sample region, additional dielectric loading blocks on two sides of

the sample region that are required to generate the field uniformity in the transverse plane, and a description of the matching-section portion of the cavity which provides the correct geometry to cause the cavity to resonate at 200 MHz with the right z dependent to simulate the exponentially-decaying heat profile in the sample region.

2945 Effect of heat treatment time and temperature of the properties of $YBa_2Cu_3O_{7-x}$. Bloom, I. (Chemical Technology Division, Argonne National Laboratory, Argonne, Illinois 60439-4837 (US)); Tani, B.S.; Hash, M.C.; Shi, D.; Patel, M.A.; Goretta, K.C.; Chen, N.; Capone, D.W.,II. *Journal of Materials Research (USA)*, 4(5): 1093-1098 (Sep 1989). DOE Contract W-31109-ENG-38.

Two $YBa_2Cu_3O_{7-x}$ powders were investigated: one was stoichiometric, and the other, CuO-rich. After being sintered at 950 °C, samples from both powders were heat-treated in oxygen at 845, 860, and 910 °C for up to 10 days. The samples were characterized by differential thermal analysis, x-ray diffraction, optical and scanning electron microscopy, iodometric titrations, and measurement of their superconducting properties (electrical resistivity, critical temperature, and critical current density). The electrical properties of the nearly stoichiometric material improved with time at all temperatures. On the other hand, the electrical properties of the CuO-rich material deteriorated with temperature, possibly owing to problems associated with grain growth at 910 °C.

2946 Raman spectroscopy of nanophase TiO_2. Melendres, C.A. (Argonne National Laboratory, 9700 South Cass Avenue, Argonne, Illinois 60439-4837 (US)); Narayanasamy, A.; Maroni, V.A.; Siegel, R.W. *Journal of Materials Research (USA)*, 4(5): 1246-1250 (Sep 1989). DOE Contract W-31109-ENG-38.

Raman spectra are reported for consolidated nanophase TiO_2 particles in their as-compacted state and after annealing at a variety of temperatures up to 1273 K. The Raman-active bands normally observed for the rutile form of TiO_2 were present in as-compacted samples having average grain sizes in the range from about 10 to 100 nm. However, significant broadening of these bands was found, which was uncorrelated with initial grain size, but not necessarily with other synthesis-related factors. This broadening decreased upon isochronal annealing at elevated temperatures in air. Based upon these observation, it is concluded that nanophase TiO_2 in the as-consolidated state contains significant defect concentrations within the rutile grains and that these intragrain defects and the grain-boundary regions as well have local atomic structures with the rutile symmetry, albeit with some short-range displacements. Some sporadic sample regions containing small amounts (<5) of the anatase form of TiO_2 were also found; these traces of anatase transformed to rutile upon annealing in air at temperatures above 883 K.

2947 Lattice defects and flux pinning in crystallized metal-oxide glasses in the Bi-Sr-Ca-Cu-O system. Shi, D. (Materials Science Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Chen, J.G.; Welp, U.; Boley, M.S.; Zangvil, A. *Applied Physics Letters (USA)*, 55(13): 1354-1356 (25 Sep 1989). DOE Contract W-31-109-ENG-38.

Large amounts of lattice defects have been observed in the crystallized metal-oxide glasses in the Bi-Sr-Ca-Cu-O system prepared by the rapid solidification method. The density of such defects has been found to greatly increase as the calcium and copper content of the starting material increases. These lattice defects are formed as a result of supersaturation of calcium and copper in the sample matrix. The intragrain critical current density has been found to increase 30 times in magnitude as the density of the lattice defects is increased in the sample matrix. The corresponding flux pinning mechanisms are discussed.

2948 States of partial order in $YBa_2Cu_3O_x$. de Fontaine, D. (Department of Materials Science and Mineral Engineering, University of California, Berkeley, Berkeley, California 94720 Department of Physics, University of California, Berkeley, Berkeley, California 94720 (US)); Mann, M.E.; Ceder, G. *Physical Review Letters (USA)*, 63(12): 1300-1303 (18 Sep 1989).

Monte Carlo simulation has been performed on a previously proposed model of oxygen ordering in $YBa_2Cu_3O_x$: A two-dimensional Ising model with isotropic first-neighbor and anisotropic second-neighbor effective pair interactions in the "chain plane." At low temperatures, states of partial order are observed in agreement with experimental findings. Such states of quasi-one-dimensional order are a consequence of the asymmetric nature of the interactions.

2949 Variation of T_{c0} in the 110 K superconductor $Bi_{1.5}Pb_{0.5}Ca_2Sr_2Cu_3O_x$. Ganapathi, L. (Department of Materials Science and Engineering, North Carolina State University, Raleigh, North Carolina 27695-7916 (US)); Narayan, J.; Kumar, A. *Applied Physics Letters (USA)*, 55(14): 1460-1462 (2 Oct 1989).

We have systematically investigated resistance of a bismuth cuprate $Bi_{1.5}Pb_{0.5}Ca_2Sr_2Cu_3O_x$ as a function of different annealing treatments. X-ray diffraction and transmission electron microscopy studies were performed on concomitant specimens for correlations between structure and superconducting properties. A sharp 110 K superconducting transition was observed in the sample which was isostructural with the n=2 member of the $(Bi,Pb)_2(Ca,Sr)_{n+1}Cu_nO_{2n+4+\delta}$ family. The zero resistance transition temperature T_{c0} was found to be sensitive to annealing at 673 K with a best result of 100 K for 30 min annealing. It is proposed that T_{c0} and transition width in bismuth cuprates are sensitive to oxygen stoichiometry.

2950 Break junction measurement of the tunneling gap of a thallium-based high-temperature superconductor crystal. Moreland, J. (Electromagnetic Technology Division, National Institute of Standards and Technology, Boulder, Colorado 80303 (US)); Ginley, D.S.; Venturini, E.L.; Morosin, B. *Applied Physics Letters (USA)*, 55(14): 1463-1465 (2 Oct 1989).

We have used the break junction method to measure the tunneling gap of a thallium-based high-temperature superconductor crystal in liquid helium at 4 K. The crystal was predominantly $Tl_2CaBa_2Cu_2O_7$ and had a superconducting onset temperature of 105 K. Tunneling data showed a symmetric gap about zero bias between two well-defined conductance peaks in the conductance versus voltage curve. The gap is consistent with a Bardeen–Cooper–Schrieffer energy gap (Δ) of 30 meV assuming a superconductor-insulator-superconductor electrode configuration. In addition, a supercurrent could be detected when the break junction was operated in a point-contact mode at temperatures as high as 95 K.

2951 Ion implantation of sputtered Y-Ba-Cu-O films. Rubin, M. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720 (US)); Brown, I.G.; Yin, E.; Wruck, D. *Journal of Applied Physics (USA)*, 66(8): 3940-3942 (15 Oct 1989).

Thin films of Y-Ba-Cu-O were deposited by rf magnetron sputtering from a single stoichiometric target and then altered in composition by ion implantation. Under optimum deposition conditions the films are deficient in Ba and Cu. Ion implantation of Cu was performed using a metal-vapor vacuum-arc source having high current and a broad energy spectrum for good depth distribution. Composition was determined by Rutherford backscattering spectrometry. The zero-resistance temperature was greatly increased after implantation and reannealing. This method could be used to write superconducting patterns on insulating material.

2952 Molecular structure and thermal stability of B_2H_4 and $B_2H^+_4$ species. Ruscic, B. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Schwarz, M.; Berkowitz, J. *Journal of Chemical Physics (USA)*, 91(8): 4576-4581 (15 Oct 1989). DOE Contract W-31-109-ENG-38.

B_2H_4 has been produced by the reaction of F atoms with B_2H_6, in successive abstraction reactions. The B_2H_4 species was detected and analyzed by photoionization mass spectrometry. The adiabatic ionization potential of this species (9.70±0.02 eV) and the vertical value (~10.4 eV) are obtained from the photoion yield curve. These values, and the shape of this curve, are consistent with a doubly bridged, C_{2v} structure for both the neutral and ionic species. The fragment ion $B_2H^+_2$ is observed, with an appearance potential of 11.53_5±0.03 eV. This value, combined with previous results, yields $D_0(B_2H_4–H)\approx 40.1$ kcal/mol, whereas $D_0(B_2H_5–H)\lesssim 102.7$ kcal/mol. The $B_2H^+_2$ fragment may have as its neutral precursor an isomeric B_2H_4 (D_{2d}), with approximately the same stability as the C_{2v} species. An earlier value for the appearance potential of $B_2H^+_4$ from B_2H_6 is shown to be too high, due to a very small formation probability at the thermochemical threshold.

2953 Further theoretical studies on B_2H_4 and $B_2H^+_4$. Curtiss, L.A. (Argonne National Laboratory, Chemical Technology Division/Materials Science Division, Argonne, Illinois 60439-4837 (US)); Pople, J.A. *Journal of Chemical Physics (USA),* 91(8): 5118-5119 (15 Oct 1989). DOE Contract W-31-109-ENG-38.

The vertical ionization potentials of the D_{2d} and C_{2v} structures of B_2H_4 are reported at the G1 level of *ab initio* molecular orbital theory. The results support the interpretation by Ruscic, Schwarz, and Berkowitz of their new photoionization experiment in terms of a C_{2v} bridged structure of B_2H_4. In addition, the bridged C_{2v} $B_2H^+_4$ cation is found to have a very small barrier to inversion (1 kcal/mol).

2954 Superconducting properties of a single-crystal sphere of $ErRh_4B_4$. Behroozi, F. (Biomolecular Engineering Branch, Naval Research Laboratory, Washington, D.C. 20375 (US)); Hall, L.N.; Crabtree, G.W.; Hinks, D.G. *Physical Review [Section] B: Condensed Matter (USA),* 40(10): 6548-6557 (1 Oct 1989).

We report on the superconducting and magnetic properties of a single-crystal sphere of the primitive tetragonal phase of $ErRh_4B_4$. Our data consist of magnetization and susceptibility measurements in fields up to 50 kOe and at temperatures down to 0.4 K. The crystal exhibits extreme anisotropy in its response to a magnetic field. It is a weak paramagnet when the external field is along the tetragonal $\bar{c}$ axis but reverts to a strong paramagnet when the field is in the basal plane. The magnetization curves reveal a first-order phase transition at H_{c2} when the field is in the basal plane. Evidence for a temperature domain in which superconductivity and long-range ferromagnetic order appear to coexist is also presented. The magnetization curves are further analyzed to obtain the critical fields, the Ginzburg-Landau parameters, Curie plot, and the ferromagnetic moment of the system.

2955 Heat capacities of LaD_x and LaH_x ($1.9 \leq x \leq 3.0$) from 1 to 300 K. Kai, K. (Ames Laboratory, Iowa State University, Ames, Iowa 50011 (JP)); Gschneidner, K.A. Jr.; Beaudry, B.J.; Peterson, D.T. *Physical Review [Section] B: Condensed Matter (USA),* 40(10): 6591-6600 (1 Oct 1989).

The heat capacities of lanthanum hydrides in the LaD_x and LaH_x ($1.9 \leq x \leq 3.0$) series have been measured over the temperature range from 1.2 to 300 K. The electronic specific-heat coefficients showed nearly the same variation for both LaD_x and LaH_x over the entire composition range, having the values of $\gamma = 0.81 \pm 0.01$ and 0.038 ± 0.01 mJ/g-at. K^2 at the stoichiometric compositions of LaD_2 (LaH_2) and LaD_3 (LaH_3), respectively. Some different variations were found in the composition dependence of the Debye temperatures of the LaD_x and LaH_x series, but, nevertheless, the same values of $FTHETA_D = 348 \pm 2$ and 381 ± 2 K were found at the compositions of LaD_2 (LaH_2) and LaD_3 (LaH_3), respectively. The variations of γ and $FTHETA_D$ do not show a monotonic behavior but depend on the formation of the three hydrogen-ordering phases, namely, $LaD(H)_{2.25}$, $LaD(H)_{2.5}$, and $LaD(H)_{2.75}$. One sharp heat-capacity peak was found in LaD_x between $x = 2.65$ and 2.90, associated with octahedral hydrogen ordering centered at $LaD_{2.75}$, whereas four sharp peaks were found in $LaD_{2.95}$ at 215.5, 265.5, 286.8, and 293.8 K and were correlated with the four transitions observed in LaD_3 by Ito *et al.* The metal-to-semiconductor transition, which is found in the alloys between $2.75 \leq x \leq 3.0$, is discussed on the basis of the electronic specific-heat coefficient and recent theoretical work. We also report that $LaH_{2.01}$ becomes a superconductor at 0.17 K and, if $LaD_{2.06}$ goes superconducting, it does so below 0.06 K.

2956 Electronic structure of $Pb_2Sr_2PrCu_3O_8$ as studied by resonant photoemission spectroscopy. Dessau, D.S. (Stanford Electronics Laboratories, Stanford University, Stanford, California 94305 (US)); Shen, Z.; Lindberg, P.A.P.; Wells, B.O.; Borg, A.; Lindau, I.; Spicer, W.E.; Waszczak, J.V.; Schneemeyer, L.F. *Physical Review [Section] B: Condensed Matter (USA),* 40(10): 6726-6730 (1 Oct 1989).

Resonant photoemission spectroscopy has been used to study the electronic structure of the recently discovered high-temperature superconductor $Pb_2Sr_2PrCu_3O_8$. The valence-band features are compared with those from other high-temperature superconductors and with band-structure calculations. A strong Cu $3d^8$ satellite arises at approximately the same energy position as in the other high-T_c superconductors, implying that to first order the model parameter U_{dd} will be quite similar. A 0.7-eV shift to higher binding energy of the band-theoretical density of states is required to obtain the best agreement with the photoemission spectra. The strong Cu $3d^8$ satellite and the discrepancy between the band theory and the photoemission spectra show the importance of correlations in this material. The valency of Pr in the material was observed to be 3+, as it had been in $PrBa_2Cu_3O_7$. The extracted Pr 4*f* spectral weight suggests that the hybridization of the Pr 4*f* states with the in-plane O states is reduced, as compared to $PrBa_2Cu_3O_{7-\delta}$. This is plausible, as the interplanar spacing is larger in this material than in $PrBa_2Cu_3O_{7-\delta}$. We infer that this hybridization is important for the quenching of the superconductivity in $PrBa_2Cu_3O_{7-\delta}$ and explains why the superconductivity is not quenched in $Pb_2Sr_2Pr_{1-x}Ca_xCu_3O_8$.

2957 ^{17}O nuclear-magnetic-resonance spectroscopic study of high-T_c superconductors. Oldfield, E. (School of Chemical Sciences, University of Illinois at Urbana-Champaign, 505 South Mathews Avenue, Urbana, Illinois 61801 (US)); Coretsopoulos, C.; Yang, S.; Reven, L.; Lee, H.C.; Shore, J.; Han, O.H.; Ramli, E. *Physical Review [Section] B: Condensed Matter (USA),* 40(10): 6832-6849 (1 Oct 1989).

We have obtained solid-state ^{17}O NMR spectra of a number of ^{17}O-enriched oxides and high-temperature oxide superconductors, including $Cu_2{}^{I}O$, $Cu^{II}O$, $KCu^{III}O_2$, Bi_2O_3, Tl_2O_3, $La_{1.85}Sr_{0.15}CuO_4$, $YBa_2Cu_3O_{7-x}$, $Bi_2Sr_2CaCu_2O_{8+x}$, $Tl_2Ba_2CaCu_2O_{8+x}$, and $Ba_{0.6}K_{0.4}BiO_3$. Spectra of all of the simple diamagnetic oxides contain relatively sharp resonances in a "diamagnetic" region of ~ -200 to $+700$ ppm (from H_2O, International Union of Pure and Applied Chemistry δ scale). $Cu^{II}O$ exhibits a broad resonance centered at ~ 4500 ppm.

2958 Superconducting energy gap and a normal-state excitation in $Ba_{0.6}K_{0.4}BiO_3$. Schlesinger, Z. (IBM Thomas J. Watson Research Center, Yorktown Heights, New York 10598 (US)); Collins, R.T.; Calise, J.A.; Hinks, D.G.; Mitchell, A.W.; Zheng, Y.; Dabrowski, B.; Bickers, N.E.; Scalapino, D.J. *Physical Review [Section] B: Condensed Matter (USA),* 40(10): 6862-6866 (1 Oct 1989). DOE Contract W-31-109-ENG-38.

We report the first measurement of the energy gap of the high-temperature bismuth oxide superconductor $Ba_{0.6}K_{0.4}BiO_3$ ($T_c \simeq 30$ K). With temperature- and magnetic-field-dependent infrared reflectivity measurements, we obtain a reduced energy gap of $2\Delta/kT_c \simeq 3.5 \pm 0.5$, consistent with a BCS-type mechanism with moderate or weak coupling. In the normal state a broad peak in the infrared conductivity is observed near 5000 cm^{-1}. This unusual infrared behavior is common to both the $BaPb_{1-x}Bi_xO_3$ and the $Ba_{1-x}K_xBiO_3$ systems and may provide a fundamental clue to the mechanism of superconductivity in the cubic bismuth oxides.

2959 Effects of oxygen and strontium vacancies on the superconductivity of single crystals of $Bi_2Sr_{2-x}CuO_{6-y}$. Sonder, E. (Oak Ridge National Laboratory, Solid State Division, Oak Ridge, Tennessee (US)); Chakoumakos, B.C.; Sales, B.C. *Physical Review [Section] B: Condensed Matter (USA),* 40(10): 6872-6877 (1 Oct 1989). DOE Contract AC05-84OR21400.

Single crystals of $Bi_2Sr_{2-x}CuO_{6-y}$ (2201 phase) were grown from CuO-rich melts. The Sr concentration in the crystals was varied from $x = 0.1$ to 0.5 by adjusting the starting composition of the melt, and the oxygen content of the crystals was reversibly adjusted between $y = 0$ and 0.5 by an appropriate heat treatment of the crystals in a thermogravimetric system. With decreasing Sr content the superconducting transition temperature, T_c, of the crystals decreased rapidly from 9 K to below 4.2 K, and the resistivity in the *a-b* plane changed from metallic (linear in T from 30 to 300 K) to semiconducting. Reducing the oxygen content in the crystals had a similar effect on the resistivity. Only crystals with close to the maximum oxygen content ($y = 0$) were superconducting, and removal of oxygen from previously superconducting crystals resulted in a rapid decrease of T_c and the eventual loss of superconductivity ($T_c < 4.2$ K). A bond-valence sum analysis suggests that oxygen is removed from the Bi_2O_2 layers.

2960 Photoemission study of monoclinic $BaBiO_3$. Shen, Z. (Stanford Electronics Laboratories, Stanford University, Stanford, California 94305 (US)); Lindberg, P.A.P.; Wells, B.O.; Dessau, D.S.; Borg, A.; Lindau, I.; Spicer, W.E.; Ellis, W.P.; Kwei, G.H.; Ott, K.C.;

and others. *Physical Review [Section] B: Condensed Matter (USA)*, 40(10): 6912-6918 (1 Oct 1989). DOE Contract AC03-82ER13000.

We present the results of photoemission studies of "valence-disordered" monoclinic $BaBiO_3$ in the photon energy range 15–120 eV. The line shapes of the valence-band photoemission spectra and the Ba contributions to the valence band are similar to the line shapes of the total density of states and Ba partial density of states, respectively. The Bi 5*d* core levels show only one peak for each spin-orbit component. Oxygen resonance is observed, demonstrating the existence of empty O 2*p* states. These results support a more covalent rather than a simple ionic picture for the electronic states of $BaBiO_3$. Our data suggest that the charge fluctuation between the two unequal Bi sites is small. We also discuss the origin of the semiconducting character of the "valence-disordered" $BaBiO_3$.

2961 Mean-field theory of oxygen-vacancy ordering in $YBa_2Cu_3O_{7-\delta}$. Wille, L.T. (Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 and Department of Physics, Florida Atlantic University, Boca Raton, Florida 33431 (US)). *Physical Review [Section] B: Condensed Matter (USA)*, 40(10): 6931-6940 (1 Oct 1989). DOE Contract AC03-76SF00098.

A high-temperature phase diagram and various correlation functions have been calculated for the partially occupied oxygen sublattice in the CuO basal plane of $YBa_2Cu_3O_{7-\delta}$ ($0 \leq \delta \leq 1$). This structure is modeled as a two-dimensional Ising system with repulsive first-neighbor and anisotropic, competing second-neighbor interactions. These interactions are selected to guarantee the stability (at zero temperature) of the two experimentally observed orthorhombic phases: a single-cell structure (with Cu-O chains parallel to the *b* axis) at δ=0 and a double-cell structure (with regularly spaced missing chains) at δ=0.5. The calculations are performed in the four- and five-point approximation of the cluster-variation method. The results are in good agreement with available experimental information.

2962 Calculation of optical transport and localization quantities. Economou, E.N. (Research Center of Crete and Department of Physics, P.O. Box 1527, 711 10 Iraklio, Crete, Greece (GR)); Soukoulis, C.M. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7977-7980 (15 Oct 1989). DOE Contract W-7405-ENG-82.

By combining a coherent-potential approximation with our previous work on localization, we calculate the mean free path *l*, the diffusion coefficient *D*, the localization parameter *kl*, where **k** is the renormalized wave vector, the localization length L_c, and other related quantities. Our results for *D* near the critical regime are in surprisingly impressive agreement with recent experimental data by Drake and Genack in a sample of titania spheres in air. Our calculations indicate that optical localization can be experimentally realized by either lowering the concentration of the titania spheres or lowering the standard deviation of the radii distribution.

2963 Molecular-dynamics investigation of deuteron separation in $PdD_{1.1}$. Richards, P.M. (Sandia National Laboratories, Albuquerque, New Mexico 87185-5800 (US)). *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7966-7968 (15 Oct 1989). DOE Contract AC04-76DP00789.

A molecular-dynamics simulation was done to investigate the D-D distances in above-stoichiometric $PdD_{1.1}$. Different potentials were used in an attempt to optimize the chances of close D-D approach. At the two temperatures studied, 300 and 1300 K, no distances closer than 0.7 A were found, thus giving no evidence for the short distances needed to produce fusion in the material.

2964 Method of fabricating optical waveguides by ion implantation doping. Appleton, B.R.; Ashley, P.R.; Buchal, C.J. To Dept. of Energy, Washington, DC. USA Patent 4,840,816. 20 Jun 1989. Filed date 24 Mar 1987. 8p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a method for fabricating high-quality optical waveguides in optical quality oxide crystals by ion implantation doping and controlled epitaxial recrystallization is provided. Masked $LiNbO_3$ crystals are implanted with high concentrations of Ti dopant at ion energies of about 350 keV while maintaining the crystal near liquid nitrogen temperature. Ion implantation doping produces an amorphous, Ti-rich nonequilibrium phase in the implanted region. Subsequent thermal annealing in a water-saturated oxygen atmosphere at up to 1000°C produces solid-phase epitaxial regrowth onto the crystalline substrate. A high-quality single crystalline layer results which incorporates the Ti into the crystal structure at much higher concentrations than is possible by standard diffusion techniques, and this implanted region has excellent optical waveguides properties.

2965 Process for single-crystal growth of high T(c) superconductors. Lechter, W.; Toth, L.; Badri, D. To Department of the Navy, Washington, DC (US). USA Patent Application 7-356,496. 25 May 1989. 11p. Available from NTIS, PC A03/MF A01.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

Large oriented crystals greater than one millimeter in length of high T_c superconducting compounds are grown by mixing starting materials in the correct proportions to make the superconducting compound, forming a mixture. The CO_2 is removed from the mixture and the ternary oxide of the compound is formed from the mixture. Next, the mixture is formed into a self-supporting green body and sintered at a sintering temperature at which the top of the self-supporting green body is molten and the bottom surface is solid. The self-supporting green body is held at the sintering temperature for a time, forming a sintered body. Next, the sintered body is cooled so that crystals form. After this step, the crystals can be further processed to increase their superconducting properties. Finally, the crystals are removed and processed for use.

2966 (AD-A–210825/6/XAB) **Fracture-toughness testing of metal-matrix composites.** Tsangarakis, N.; Nunes, J.; Slepetz, J.M. Army Materials Research Agency, Watertown, MA (USA). Materials Technology Lab. Jun 1989. 21p. (MTL-TR–89-51). Available from NTIS, PC A03/MF A01.

Pub. in Engineering Fracture Mechanics, Vol. 30, No. 5, 565-577(1988).

Various specimen designs and test procedures were used to assess the fracture toughness of the following metal-matrix composites: aluminum oxide, continuous-fiber-reinforced aluminum and magnesium, and silicon carbide particulate and continuous fiber-reinforced aluminum. The following types of specimens were examined: the compact tension, the double-edge notched, the center notched, the short-rod, and the Charpy bar. The fracture-toughness values for the ceramic continuous-fiber-reinforced metal-matrix composites were found to be dependent on the geometry of the specimen. Except for cross-ply laminates, fracture tended to occur primarily parallel to fibers. It was inferred that a linear elastic fracture mechanics approach may not be appropriate for the determination of fracture toughness of these materials. The results of the particulate-reinforced metal-matrix composite encourage a further consideration of the ASTM E-399 test procedure as a standard method for the determination of fracture toughness of this type of composite.

2967 (AD-A–211170/6/XAB) **Y-Si-Al-O-N glass fibers. Final report.** Messier, D.R.; Gleisner, R.P.; Rich, R.E. Army Materials Research Agency, Watertown, MA (USA). Materials Technology Lab. May 1989. 17p. (MTL-TR–89-44). Available from NTIS, PC A03/MF A01.

The excellent mechanical properties and outstanding water corrosion resistance of Y-Si-Al-O-N glasses indicate that they are attractive candidate materials for forming into high-performance glass fibers. Fibers of glasses containing, respectively, 3.2 and 6.6 wt% N were drawn freehand in air, and from glass rods in N2. Continuous fibers (100-m long) of the former glass were melt-drawn in N2 while being wound in air outside of the glass-melting furnace. Some fibers had diameters as small as 10 um, and characterization data show that the fibers retain all of the desirable properties of the bulk glass.

2968 (CONF-880810–2) **Standard molar enthalpies of formation and transition at 298.15 K and other thermodynamic properties of the crystalline and vitreous forms of arsenic sesquiselenide (As_2Se_3): Dissociation enthalpies of As-Se bonds.** O'Hare, P.A.G.; Lewis, B.M.; Susman, S.; Volin, K.J. Argonne National Lab., IL (USA). [1988]. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-8809198–1: 10. IUPAC conference on chemical thermodynamics; 4. Polish conference on calorimetry and thermal analysis, Prague (Czechoslovakia); Warsaw (Poland), 29 Aug - 2 sep 1988; 4-10 sep 19). Order Number DE90002260. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Fluorine-combustion calorimetry was used to determine the standard molar enthalpies of formation (at 298.15 K and p^0 = 101.325 kPa) of the crystalline and vitreous forms of arsenic sesquiselenide. The following results were obtained: $\Delta_f H_m^0(As_2Se_3, cr) = -(86.1 \pm 4.1)$ kJ·mol^{-1} and $\Delta_f H_m^0(As_2Se_3, vit) = -(58.1 \pm 4.2)$ kJ·mol^{-1}. The enthalpy of the transition from the vitreous to the crystalline forms of As_2Se_3, $-(28.0 \pm 3.9)$ kJ·mol^{-1} at 298.15 K, supports two of several published values for the enthalpy of fusion of the crystalline sesquiselenide. The present results have been combined with enthalpy increments and the standard entropy recalculated from the literature to give, for As_2Se_3(cr) only, $\Delta_f H_m^0$ and the standard molar Gibbs energy of formation $\Delta_f G_m^0$ as functions of temperature. Mean bond enthalpies have been deduced for As_4Se_3(g) and As_4Se_4(g) on the basis of the new $\Delta_f H_m^0$ values, and the thermodynamic results are shown to be consistent with a linear structure for As_2Se_2(g). Bond dissociation enthalpies D_m^0(As–X) are given, where X = O, S, Se, and Te. 47 refs., 1 fig., 4 tabs.

2969 (CONF-8908179–2) **Maximum entropy and equations of state for random cellular structures.** Rivier, N. Argonne National Lab., IL (USA). 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Conference on maximum entropy and bayesian methods; Hanover, NH (USA); 14-18 Aug 1989. Order Number DE90002840. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Random, space-filling cellular structures (biological tissues, metallurgical grain aggregates, foams, etc.) are investigated. Maximum entropy inference under a few constraints yields structural equations of state, relating the size of cells to their topological shape. These relations are known empirically as Lewis's law in Botany, or Desch's relation in Metallurgy. Here, the functional form of the constraints is now known as a priori, and one takes advantage of this arbitrariness to increase the entropy further. The resulting structural equations of state are independent of priors, they are measurable experimentally and constitute therefore a direct test for the applicability of MaxEnt inference (given that the structure is in statistical equilibrium, a fact which can be tested by another simple relation (Aboav's law)). 23 refs., 2 figs., 1 tab.

2970 (DOE/ER/13732–2) **Synthesis and properties of new preceramic materials: Research progress report, December 1, 1988–November 30, 1989.** Sneddon, L.G. Pennsylvania Univ., Philadelphia, PA (USA). Sep 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13732. Order Number DE90002562. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The development of new methods for the production of complex materials is one of the most important problems in modern solid state chemistry and materials science. This project is attempting to apply the synthetic principles which have evolved in inorganic and organometallic chemistry to the production of important non-oxide ceramics, such as boron nitride, boron carbide and metal borides. Our recent work has now resulted in the production of several new polymer systems, including poly(vinylborazine), poly(vinylpentaborane) and poly(borazylene), that have proven to be high yield precursors to boron nitride and/or boron carbide. Current work is now directed toward the synthesis of new types of molecular and polymeric boron-containing species and an exploration of the solid state properties of the ceramics that have been produced in these studies.

2971 (INIS-BR–1766) **Fluorescence and optical absorption in spodumene.** Antonini, R. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1987. 101p. (In Portuguese). Order Number DE90608107. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

This work studied the mechanism of the isothermal decay's kinetic of the 15.600 cm-1 optical absorption band (A.O.) of irradiated spodumene, and the phosphorescence of irradiated spodumene in low temperatures. The kinetic mechanisms applying the bimolecular model to liberation, capture and recombination reactions are analysed. The coupled differential equations, resultants of this model, numerically using the Runge-Kutta method is solved, and a computer programs that allowed determine the kinetics parameters by try and error methods is developped. This work showed that the electrons are untrapped according to Arrhernios kinetic and that the parameters of the trap and recombination are proportional to a factor ($\sqrt{T} - \sqrt{T_o}$), where T_o is the cutting temperature, bfore which the reactions do not occur. (author).

2972 (JAERI-M–89-096) **Gamma-ray irradiation effects of poly(ethylene-2, 6-naphthalate) and poly(ethylene-terephthalate).** Saito, Toshio; Seguchi, Tadao; Nagano, Shosaburo; Omae, Iwao. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1989. 34p. (In Japanese). Order Number DE90719605. Available from NTIS (US Sales Only), PC A03/MF A01.

The irradiation effects and radiation resistances of poly(ethylene-2, 6-naphthalate) (PEN) and poly(ethylene-terephthalate)(PET) were investigated by the analyses of evolved gases, crosslinking and chain scission, and physical properties of thermal behavior and tensile strength after irradiation by gamma-rays under vacuum and in oxygen atmosphere. The evolved gases in both PEN and PET were mainly CO_2 and small amounts of H_2, CH_4, and CO. The G-values of CO_2 were 0.004 for PEN and 0.07 for PET by irradiation under vacuum, and were 0.26 for PEN and 0.17 for PET in oxygen. In the case of irradiation without oxidation, the crosslinking proceeded mainly for PEN, but the chain scission was the main reaction for PET. In the case of oxidative irradiation, the chain scission proceeded and no cross-linking was observed for both PEN and PET. The change of mechanical properties of PEN film irradiated under vacuum was very small by comparing with PET. The radiation resistances of PEN and PET were evaluated to be 12 MGy for PEN and 2 MGy for PET in non-oxidative conditions, and were 4.5 MGy for PEN and 1.4 MGy for PET in oxidation conditions by the measurements of tensile testing. The reason of high radiation resistance of PEN was thought that PEN molecules have a large resonance energy of napthalene in the polymer chain, and have higher probability of crosslinking comparing with PET molecules due to the molecular conformation such as crystalline structure. (author).

2973 (N–89-26918) **Fracture toughness of SIC/Al metal matrix composite.** Flom, Y.; Parker, B.H.; Chu, H.P. National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center. Aug 1989. 18p. (NASA-TM–100745;NAS–1.15:100745;REPT–89B00215;CONF-8909260–: 21. international conference of the Society for the Advancement of Materials and Process Engineering (SAMPE), Atlantic City, NJ (USA), 25-28 Sep 1989). Available from NTIS, PC A03/MF A01.

An experimental study was conducted to evaluate fracture toughness of SiC/Al metal matrix composite (MMC). The material was a 12.7 mm thick extrusion of 6061-T6 aluminum alloy with 40 v/o SiC particulates. Specimen configuration and test procedure conformed to ASTM E399 Standard for compact specimens. It was found that special procedures were necessary to obtain fatigue cracks of controlled lengths in the preparation of precracked specimens for the MMC material. Fatigue loading with both minimum and maximum loads in compression was used to start the precrack. The initial precracking would stop by self-arrest. Afterwards, the precrack could be safely extended to the desired length by additional cyclic tensile loading. Test results met practically all the E399 criteria for the calculation of plane strain fracture toughness of the material. A valid K_{IC} value of the SiC/Al composite was established as K_{IC} = 8.9 MPa square root of m. The threshold stress intensity under which crack would cease to grow in the material was estimated as delta K sub th = 2MPa square root of m for R = 0.09 using the fatigue precracking data. Fractographic examinations show that failure occurred by the micromechanism involved with plastic deformation

although the specimens broke by brittle fracture. The effect of precracking by cyclic loading in compression on fracture toughness is included in the discussion.

2974 (N–89-26989) **Fatigue crack growth study of SCS6/Ti-15-3 composite.** Kantzos, P.; Telesman, J. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Aug 1989. 20p. (NASA-TM–102332;E–5041;NAS–1.15:102332). Available from NTIS, PC A03/MF A01.

A study was performed to determine the fatigue crack growth (FCG) behavior and the associated fatigue damage processes in a (0)(8) and (90)(8) oriented SCS(6)/Ti-15-3 composite. Companion testing (CT) was also done on identically processed Ti-15-3 unreinforced material. The active fatigue crack growth failure processes were very similar for both composite orientations tested. For both orientations, fatigue crack growth was along the fiber direction. It was found that the composite constituent most susceptible to fatigue damage was the interface region and in particular the carbon coating surrounding the fiber. The failure of the interface region lead to crack initiation and also strongly influenced the FCG behavior in this composite. The failure of the interface region was apparently driven by normal stresses perpendicular to the fiber direction. The FCG rates were considerably higher for the (90)(8) oriented CT specimens in comparison to the unreinforced material. This is consistent with the scenario in which the interface has lower fatigue resistance than the matrix, causing lower composite fatigue resistance. The FCG rates of the (0)(8) composite could not be directly compared to the (90)(8) composite but were shown to increase with an increase in the crack length.

2975 (N–89-27223) **Optimum interface properties for metal matrix composites.** Ghosn, L. J.; Lerch, B. A. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Aug 1989. 21p. (NASA-TM–102295;E–4964;NAS–1.15:102295). Available from NTIS, PC A03/MF A01.

Due to the thermal expansion coefficient mismatch (CTE) between the fiber and the matrix, high residual sresses exist in metal matrix composite systems upon cool down from processing temperature to room temperature. An interface material can be placed between the fiber and the matrix to reduce the high tensile residual stresses in the matrix. A computer program was written to minimize the residual stress in the matrix subject to the interface material properties. The decision variables are the interface modulus, thickness and thermal expansion coefficient. The properties of the interface material are optimized such that the average distortion energy in the matrix and the interface is minimized. As a result, the only active variable is the thermal expansion coefficient. The optimum modulus of the interface is always the minimum allowable value and the interface thickness is always the maximum allowable value, independent of the fiber/matrix system. The optimum interface thermal expansion coefficient is always between the values of the fiber and the matrix. Using this analysis, a survey of materials was conducted for use as fiber coatings in some specific composite systems.

2976 (N–89-27795) **Computational simulation of high temperature metal matrix composites cyclic behavior.** Chamis, C. C.; Murthy, P. L. N.; Hopkins, D. A. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Nov 1988. 15p. (NASA-TM–102115;E–4888;NAS–1.15:102115;CONF-8811285–: ASTM symposium on thermal and mechanical behavior of ceramic and metal matrix composites, Atlanta, GA (USA), 7-8 Nov 1988). Available from NTIS, PC A03/MF A01.

A procedure was developed and is described which can be used to computationally simulate the cyclic behavior of high temperature metal matrix composites (HTMMC) and its degradation effects on the structural response. This procedure consists of HTMMC mechanics coupled with a multifactor interaction constituent material relationship and with an incremental iterative nonlinear analysis. The procedure is implemented in a computer code that can be used to computationally simulate the thermomechanical behavior of HTMMC starting from the fabrication process and proceeding through thermomechanical cycling, accounting for the interface/interphase region. Results show that combined thermal/mechanical cycling, the interphase, and in situ matrix properties have significant effects on the structural integrity of HTMMC.

2977 (N–89-28035) **Research and technology plans for FY 1989 and accomplishments for FY 1988.** Bales, K.S. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. Apr 1989. 95p. (NASA-TM–101592;NAS–1.15:101592). Available from NTIS, PC A05/MF A01.

The Objectives, FY 1989 Plans, Approach, and FY 1989 Milestones for the Structural Mechanics Division's research programs are presented. Fiscal year 1988 Accomplishments are presented where applicable. This information is useful in program coordination with other governmental organizations in areas of mutual interest.

2978 (ND-R–1065(S)) **Detection of fine pore structures in graphite by impregnation with Wood's metal.** Morris, F.W.; Schofield, P.; Whitty, S. UKAEA Northern Research Labs., Risley (UK). Oct 1988. 15p. Available from H.M. Stationery Office, London, price Pound 8.50.

A method is described for the high pressure impregnation of graphite with Wood's Metal leading to the filling of pore sections as narrow as 0.1 μm. The method allows high resolution, high contrast imaging of graphitic pore structures in the scanning electron microscope with subsequent automatic image analysis. The choice of operating parameters for the scanning examination and during image analysis is explained. (author).

2979 (ORNL/FTR–3089) **[Graphite and carbon/carbon composition]: Foreign trip report, September 17, 1988–September 28, 1988.** Eatherly, W.P. Oak Ridge National Lab., TN (USA). 20 Oct 1988. 18p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90001303. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report covers the author's attendance at the international conference, CARBON '88, held at the University of Newcastle upon Tyne, on September 18–23, 1988, and ancillary program planning meetings held at Newcastle, United Kingdom (UK), and Juelich, Federal Republic of Germany (FRG). The conference presented two half-day sessions on nuclear applications of graphite which were well attended by people with both fission and fusion interests. This author presented two papers containing work to which C. R. Kennedy of Oak Ridge National Laboratory (ORNL) had been a major contributor. One paper provides an empirical correlation between graphite creep and dimensional changes; the other describes dimensional behavior of an anisotropic graphite used in the N Reactor at Richland, Washington.

2980 (PB–89-208235/XAB) **Applicability of the DMSO (dimethyl sulfoxide) aggregate degradation test to determine moisture-induced distress in asphalt-concrete mixes. Final report, June 1986-June 1987.** Heinicke, J.J.; Vinson, T.S.; Wilson, J.E. Oregon State Univ., Corvallis, OR (USA). Transportation Research Inst. Jun 1987. 99p. (TRR–87-26). Available from NTIS, PC A05/MF A01.

A laboratory investigation was conducted to evaluate the effectiveness of the dimethyl sulfoxide accelerated weathering test (DMSO test) to predict moisture-induced distress in asphalt-concrete mixtures. Asphalt-concrete specimens were fabricated using aggregates from three quarries. The specimens were conditioned using vacuum saturation and a series of five freeze/thaw cycles. The resilient modulus (M_r) was obtained before and after each conditioning cycle and the Index of Retained Resilient Modulus (IRM_r) was determined. The results indicate the DMSO test may be used to identify the potential for moisture-induced distress in asphalt-concrete mixtures. However, no correlation was determined between the DMSO test results and the IRM_r or fatigue life test results. The strain and temperature dependencies of the M_r were determined for a dense-graded asphalt-concrete mixture. It was concluded that constant stress testing may result in a misinterpretation of the IRM_r and tests conducted within the currently accepted temperature range may result in a plus or minus 20% deviation in the IRM_r. In an accompanying analytical program, the effect of diametral test boundary conditions on the measured value of M_r was evaluated using two- and three-dimensional finite element models. The results indicate that the resilient modulus diametral test is adequately represented by elastic theory and an assumed plane stress condition.

2981 (PB–89-870612/XAB) **Plastics and elastomers: Radiation crosslinking. April 1986-September 1989 (Citations from**

the Rubber and Plastics Research Association data base). Report for April 1986-September 1989. National Technical Information Service, Springfield, VA (USA). Sep 1989. 77p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869458. See also PB–89-870927.

This bibliography contains citations concerning radiation cross-linking processes for plastics and elastomers. Radiation sources and manufacturing processes are discussed, and the molecular structure and mechanical properties of the polymers are considered. Applications for paints, varnishes, adhesives, inks, and insulating coatings are presented. (This updated bibliography contains 114 citations, 32 of which are new entries to the previous edition.)

2982 (PB–89-871107/XAB) **Fire-extinguishing agents. January 1970-September 1989 (Citations from the COMPENDEX data base). Report for January 1970-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 74p. Available from NTISPC N01/MF N01.

Supersedes PB–83-805499.

This bibliography contains citations concerning fire-extinguishing agents including foams, aqueous films, dry chemicals, fly ash, inert gases, and halogenated compounds. Performance characteristics, interaction mechanisms, and properties of these agents are examined. Applications in building fires, shipboard fires, mining, aircraft, automobile fires, and industrial chemical fires are presented. Fire detection and alarm systems are examined in a separate bibliography. (This updated bibliography contains 181 citations, 75 of which are new entries to the previous edition.)

2983 (PPA-T–82) **Synthesis of acrylic prepolymer.** Hussin bin Mohd Nor; Dahlan bin Haji Mohd; Mohamad Hilmi bin Mahmood. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). Apr 1988. 12p. Order Number DE90608085. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

An acrylic prepolymer was synthesized from glycidyl methacrylate (GMA), butyl methacrylate (BMA), methyl methacrylate (MMA) and acrylic acid (AA). Butyl acetate (BAc), benzoyl peroxide (BzO), 4-methoxyphenol (MPh) and triethylamine (TEA) were used as solvent, initiator, inhibitor and catalyst respectively. Observations of the synthesis leading to the formation of acrylic prepolymer are described. (author).

2984 (PPA-T–86) **Synthesis of epoxidised soya bean oil acrylate.** Hussin bin Mohd Nor; Mohamad Hilmi bin Mahmood; Dahlan bin Haji Mohd. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). Oct 1988. 10p. Order Number DE90608086. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

An epoxy acrylate was synthesized from Asahi's epoxy resin AER 331 which is an epoxidised soya bean oil (ESBO). Triethylamine (TEA) and Hydroquinone (HQ) were used as catalyst and inhibitor respectively. Observations of the experiment are described. (author).

2985 (RFP–4377) **Hydrogen permeability coefficient determinations for used waste drum liners.** McFeeters, T.L. Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant. Oct 1989. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP03533. Order Number DE90002233. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Hydrogen permeability coefficients were determined for samples of drum liner materials (polyvinylchloride and polyethylene bags) from stored drums of radioactive waste. The hydrogen permeability coefficients were determined by dynamic mass spectrometry, and are quantitatively traceable to the National Bureau of Standards. This report presents the analytical results obtained and a brief discussion of the analytical experimentation. Since sample variables (drum storage time and conditions, radioactive flux, material surface contamination, etc.) are potential factors and are not available here for correlation with permeability results, no interpretative discussion of these factors is included in this report. 3 figs., 1 tab.

2986 (UCRL–98583) **Gels and foams from ultrahigh molecular weight polyethylene.** Hair, L.M.; Letts, S.A.; Tillotson, T. Lawrence Livermore National Lab., CA (USA). Jul 1988. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-880912–34: 196. American Chemical Society national meeting, Los Angeles, CA (USA), 25-30 Sep 1988). Order Number DE90001896. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Ultrahigh molecular weight polyethylene (UHMW PE) foams with densities from 0.04 to 0.2 g/cm^3 have routinely been made in our laboratory. First, an entangled solution of UHMW PE is made. Then, the solution is geled by cooling to crystallize the PE. The gel is later dried to a foam by critical point drying. Viscometry and cloud point measurements were used to determine the gelatin point and the critical gelatin concentrations. Polarized light microscopy and differential scanning calorimetry were used to investigate the effects of cooling rate on the gel, while the effects of cooling rate on the foam were investigated via x-ray diffraction and scanning electron microscopy. We found that rapid cooling of 5 wt % UHMW PE/tetralin solutions to −10°c yielded small, uniform structure at the expense of crystallinity and strength; cooling over three days yielded spherulitic structure with strength. 5 refs., 3 figs.

2987 (UCRL–98656) **Studies of polymer foam morphology with FIR [far-infrared radiation] laser scattering.** Hrubesh, L.W.; Staffin, R.; Boercker, D.B.; Wainright, T. Lawrence Livermore National Lab., CA (USA). Apr 1988. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-880870–4: 4. international conference on infrared physics, Zurich (Switzerland), 22-26 Aug 1988). Order Number DE90002235. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We report on the experimental observation of peaks in the angular distribution of far-infrared radiation scattered from solid, low density polymer foams. The results are consistent with a description of scattering from density fluctuations within the foams. 3 refs., 1 fig.

2988 (UCRL–102028) **Challenges in processing for polymer composites.** Chiao, L.; Chiao, T.T. Lawrence Livermore National Lab., CA (USA). 13 Sep 1989. 23p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8910290–1: 36. Sagamore conference on thick section composites, Plymouth, MA (USA), 23-26 Oct 1989). Order Number DE90002224. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Processing technology is considered to be the key for future cost and performance improvement in fiber composite structures. The challenges are discussed in two broad areas: Engineering and research. In engineering, the challenge is to reduce cost while maintaining the state-of-the-art quality of composite structures. This can be done through innovative process development work. In research, the challenge is to concentrate on processing science. We need to reexamine and focus on basic issues such as voids, fiber wetting and filament/tow collimation, fiber/resin ratio, uniform fiber distribution and cure effects. These issues, combined and interactive in a laminate, have created many confusing topics such as "composite toughness", low transverse failure strain and poor compression properties. To date, processing technology is considered the weak link in the chain of a fiber composite system, which also includes good design practices and proper material selections. This is because process studies in composites have traditionally been considered mundane by many researchers; furthermore, this type of work is very difficult to do in universities. We strongly believe, however, that the highest potential for cost reduction for composites is clearly in processing technology. Also, process improvement technology may often be an easier option than the materials modification approach, to resolving many of the longstanding and confusing issues in the field of fiber composites. 12 refs., 13 figs., 2 tabs.

2989 Electron microscopy study of morphology and composition of a ferrisilicate catalyst. Csencsits, R. (Center for Advanced Materials, Materials and Chemical Sciences Div., Lawrence Berkeley Lab., and Materials Science and Mineral Engineering Dept., Univ. of California, Berkeley, CA (US)); Gronsky, R.; Nair, V.; Szostak, R. vp of Microstructure and properties of catalysts. Treach, M.M.J.; Thomas, J.M.; White, J.M. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC03-76SF00098;AC22-86PC90007. (CONF-8711205–: Symposium on microstructure and properties of catalysts, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper the effects of various synthesis conditions on the structure and composition of ferrisilicate analogs of zeolite ZSM-5 are considered. Scanning electron microscopy (SEM) was used to

determine the particles size distributions and morphologies. Particle sizes vary from tenths of a micron to several microns, depending on degree of agitation during crystal growth, while morphology is additionally dependent on the concentration of iron in the gel during crystallization. X-ray emissive spectroscopy (XES) performed in the transmission electron microscopy (TEM) was used to determine their composition variation. The distribution of iron amongst the crystals is described.

2990 Enhanced oxidation of $TiSi_2$ films by As^+ implantation. Holland, O.W. (Oak Ridge National Lab., Oak Ridge, TN (US)); Fathy, D. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper the influence of As^+-ion implantation on the oxidation of $TiSi_2$ films is investigated. It is shown that implantation leads to a greatly increased rate of oxidation in a dry O_2 ambient. Low-temperature oxidation of the implanted films not only results in substantial oxidation of the films, but completely alters the films' morphology. Different implantation techniques were used. It is shown that neither chemical nor damage effects are able, by themselves, to account for the enhanced oxidation. A model is proposed to explain the role of implantation in the oxidation process.

2991 In situ tem observations of heavy ion damage in gallium arsenide. Bench, M.W. (Univ. of Illinois, Urbana, IL (US)); Robertson, I.M.; Kirk, M.A. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract W-31109-ENG-38. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper discusses transmission electron microscopy experiments performed to investigate the lattice damage created by heavy-ion bombardments in GaAs. These experiments have been performed in situ by using the HVEM - Ion. Accelerator Facility at Argonne National Laboratory. Direct-impact amorphization is observed to occur in both n-type and semi-insulating GaAs irradiated to low ion doses at 30 K and room temperature. The probability of forming a visible defect is higher for low temperature irradiations than for room temperature irradiations.

2992 Structural studies of pillared clays and modified pillared clays. Carrado, K.A. (Chemistry Div., Argonne National Lab., 9700 South Cass Avenue, Argonne, IL (US)); Thompson, A.R.; Winans, R.E.; Botto, R.E. vp of Microstructure and properties of catalysts. Treach, M.M.J.; Thomas, J.M.; White, J.M. Materials Research Society, Pittsburgh, PA (1988). DOE Contract W-31-109-ENG-38. (CONF-8711205–: Symposium on microstructure and properties of catalysts, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper the long-range order of pillared interlayered clays (PILCs) after acid activation with 0.05N HCl is investigated by X-ray diffraction (XRD) methods. The data show that long-range order in PILCs decreases as AlCH-PB = ZrCH-PB >> Zr/AlCH-PB = Cr/AlCH-PB (PB = pillared bentonite; MCH = metal chlorohydroxy pillaring agent, where M = Al, Zr or Cr). Apparently, pure oxide clusters are more stable than mixed oxide clusters. Treatment of PILCs with dilute HCl at 25^0C is less damaging than at reflux temperature, and calcined PILCs are more stable than air-dried materials.

2993 A new polymer-based hydrogen getter. Gilliom, L.R. (Sandia National Labs., Div. 1811, Albuquerque, NM (US)). vp of Microstructure and properties of catalysts. Treach, M.M.J.; Thomas, J.M.; White, J.M. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711205–: Symposium on microstructure and properties of catalysts, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes styrene-butadiene triblock copolymer PS-PB-PS hydrogenated in the bulk using the Crabtree catalyst [Ir(COD) (py) (tcyp)]PF_6 (COD = 1,5-cyclooctadiene, py = pyridene, tcyp = tricyclohexylphosphine). Since this polymer/catalyst mixture reacts rapidly with hydrogen at ambient temperature and low hydrogen pressures, it should act as an effective hydrogen getter.

2994 High energy ion beam annealing in implanted CdTe. Withrow, S.P. (Oak Ridge National Lab., Oak Ridge, TN (US)); Lusnikov, A.; Jimenez-Gonzalez, H.; Dresselhaus, G. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400;AC05-76OR00033. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper the annealing effects of a high energy beam of Cu ions on implanted CdTe crystals are studied. Single crystals of CdTe have been implanted with Eu (energy 60 keV, fluence 1×10^{16} cm^{-2}) at substrate temperatures of 25^0C, and 400^0C. Lattice damage introduced by the implantation process was measured by Rutherford backscattering. The samples were then implanted with high energy Cu ions (energy 3.5 MeV, fluence 0.5×10^{16} cm^{-2}) at substrate temperatures of 25^0C and 200^0C. Channeling spectra from these samples indicate a reduction in the near-surface lattice damage as a result of the Cu implantation that can be unambiguously separated from the external heating of the substrate.

2995 Time-resolved reflectivity measurement of the pressure-enhanced crystallization rate of amorphous Si in a diamond anvil cell. Lu, G.Q. (Harvard Univ., Cambridge, MA (US)); Nygren, E.; Turnbull, D.; Aziz, M.J. vp of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

The authors have measured the pressure dependence of the solid phase epitaxial growth (SPEG) rate of self-implanted Si(100) by using the in-situ time-resolved reflectivity technique in a high-temperature and high-pressure diamond anvil cell (DAC). With fluid argon as the pressure transmission medium, a clean and perfectly hydrostatic pressure environment is achieved around the sample. The implications of results for the nature of the defect responsible for thermal SPEG and irradiation enhanced SPEG is discussed.

2996 Recrystallization characteristics of amorphous Si. Herring, R.A. (Martin Marietta Labs., Baltimore, MD (US)); Fiore, E.M. vp of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper discusses the microstructure of high-energy (0.5-6.0 MEV) As-ion implanted Si and rapid thermal annealed (RTA'd) Si studied by transmission electron microscopy (TEM). The implantations formed buried amorphous layers that recrystallized during RTA at different temperatures and became either single crystal or polycrystalline depending on their implantation energy and fluence. The results are explained by both the formation mechanisms of amorphous Si resulting from ion implantation and the structural order of a-Si.

2997 Precipitation, phase transformation, and enhanced diffusion in ion-implanted silicon. Pennycook, S.J. (Oak Ridge National Lab., Oak Ridge, TN (US)); Culbertson, R.J.; Berger, S.D. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes Z-contrast scanning transmission electron microscopy used to study the connection between dopant precipitation and phase transformation in high dose In^+ and Sb^+ implanted Si. In the case of In, the observations confirm a heterogeneous nucleation model. Images of the precursor precipitates give the first measurement of the diffusion coefficient in amorphous Si, with an enhancement of 10^7 over tracer crystalline values. With Sb^+ implants enhanced homogeneous nucleation is observed. The connection between these results and the transient enhanced diffusion observed in crystallized Si is discussed.

2998 Supercooling of silicon and germanium after laser melting. Stiffler, S.R. (Cornell Univ., Ithaca, NY (US)); Thompson, M.O.; Peercy, P.S. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

Following pulsed laser melting, supercoolings of 505 K in Si and 430 K in Ge were observed prior to bulk nucleation. These large supercoolings are obtained because of the extremely high thermal quench which follows laser irradiation. In this paper nucleation rates are estimated. Assuming that homogeneous nucleation was achieved, surface energies are also reasonable agreement with traditional homogeneous nucleation experiments. This laser melting technique is applicable to nucleation studies in a wide variety of materials.

2999 Interface temperatures and temperature gradients in silicon during pulsed laser irradiation. Larson, B.C. (Oak Ridge National Lab., Oak Ridge, TN (US)); Tischler, J.Z.; Mills, D.M. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC05-84OR21400. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

Nanosecond-resolution x-ray diffraction has been used to measure the interface and lattice temperatures of silicon during rapid, pulsed-laser induced melting and regrowth in silicon. Measurements have been carried out on <100> and <111> oriented silicon using the (100) and (111) reflections to measure the thermal strain during 30 ns, 1.1 J/cm^2 KrF laser pulses. The results are discussed in this paper. Observations of higher than expected temperature gradients below the liquid-solid interface are discussed in terms of restricted heat flow under high gradients.

3000 Interface velocity transients during melting of a-Si/c-Si thin films. Tsao, J.Y. (Sandia National Labs., Albuquerque, NM (US)); Peercy, P.S.; Aziz, M.J.; Thompson, M.O. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

The authors report transient conductance measurements of liquid/solid interface velocities during pulsed laser melting of amorphous Si (a-Si) films on crystalline Si (c-Si), and a more accurate, systematic procedure for analyzing these measurements than described in previous work. From these analyses are extracted relations between the melting velocities of a-Si and c-Si at a given interface temperature, and between the temperature during steady-state melting of a-Si and c-Si at a given interface velocity.

3001 Ion beam modification of film stress and the effectiveness of thin film encapsulants on GaAs. Haynes, T.E. (Univ. of North Carolina, Chapel Hill, NC (US)); Chu, W.K.; Picraux, S.T. pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

This paper describes an ion implantation to modify the initial stress in thin (40 nm) SiO_2 films on GaAs, and to condition the SiO_2-GaAs interface to promote adhesion. The effectiveness of these implanted films as caps to suppress decomposition of GaAs during rapid thermal processing has been studied, and this provides an indicator of the mechanical stability of the films. Measurements of the initial film stress, as well as stress change caused by implantation and annealing, have been made to help interpret the implantation results.

3002 Molecular dynamics of laser ablation of a polymer coating. Noid, D.W. (Chemistry Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831 (US)); Gray, S.K. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 756-760 (1 Oct 1988). Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

Large-scale molecular dynamics calculations have been carried out to simulate laser ablation on a polymer surface. The model consisted of a polyethylene chain with 400 CH_2 units placed on a polymer surface. A laser excitation was simulated by giving a small portion of the polymer chain a nonequilibrium momentum distribution. The excitation energy threshold for fragmentation of the polymers was found to be quite large, owing to the tendency of the system to transfer large amounts of vibrational energy along the chain.

3003 Adsorption of NO on diamond C(111)-(2×1) by band-gap excitation. Hamza, A.V. (Sandia National Laboratories, Livermore, California 94551 (US)); Kubiak, G.D. *Journal of Vacuum Science and Technology, B: Microelectronics Processing and Phenomena (USA),* 7(5): 1165-1170 (Sep 1989).

Band-gap excitation promoted the adsorption of nitric oxide on diamond C(111)-(2×1). In the absence of laser excitation the sticking probability for NO was $\sim 10^{-8}$. Laser excitation of the surface at 226 nm, with a duty cycle of 10^{-7}, significantly enhanced the adsorption of NO. The time-averaged reactive sticking probability for the laser-irradiated surface increased by more than a factor of 100. However, the reaction saturated at ~1.2% of a monolayer oxygen adatom coverage, indicative of adsorption mediated by defect sites. Similar behavior was observed on the diamond C(100)-(1×1) surface. Translational activation of the adsorption of NO was also observed. The adsorption probability for NO accelerated to ~280 meV by supersonic molecular-beam techniques was $\sim 6 \times 10^{-4}$ for the diamond C(111)-(2×1) surface, but again chemisorption saturated at ~1.6% of a monolayer O adatom coverage.

3004 Anisotropic thermionic emission of electrons contained in GaAs/AlAs floating gate device structures. Lott, J.A. (Sandia National Laboratories, Division 1141, Albuquerque, New Mexico 87185 (US)); Klem, J.F.; Weaver, H.T. *Applied Physics Letters (USA),* 55(12): 1226-1228 (18 Sep 1989). DOE Contract AC04-76DP00789.

Thermionic emission rates are reported for electrons in GaAs epilayers, where electrostatic barriers within the layers and GaAs/AlAs heterojunctions form different sides of the potential well. Attempt times at the two barrier types were observed to differ by factors above 10^7 due to differing constraints on momentum conservation during emission. These emissions represent escape mechanisms for charge stored in a closed geometry, III-V compound floating gate transistor, with potential application as dynamic random access or nonvolatile memories.

3005 Ultralow recombination velocity at $Ga_{0.5}In_{0.5}P$/GaAs heterointerfaces. Olson, J.M. (Solar Energy Research Institute, Golden, Colorado 80401 (US)); Ahrenkiel, R.K.; Dunlavy, D.J.; Keyes, B.; Kibbler, A.E. *Applied Physics Letters (USA),* 55(12): 1208-1210 (18 Sep 1989).

Using time-resolved photoluminescence, we have examined the optoelectronic properties of $Ga_{0.5}In_{0.5}P$/GaAs/$Ga_{0.5}In_{0.5}P$ double heterostructures grown by organometallic chemical vapor deposition. For comparison, similar structures using $Al_{0.4}Ga_{0.6}As$/GaAs and $Al_{0.5}In_{0.5}P$/GaAs lattice-matched heterointerfaces were also examined. For the $Ga_{0.5}In_{0.5}P$/GaAs heterostructure, we show that the recombination velocity at a $Ga_{0.5}In_{0.5}P$/GaAs interface can be less than 1.5 cm/s. As a result, photoluminescence decay times as long as 14 μs have been observed in undoped GaAs double heterostructures. This photoluminescence decay time varies with temperature as $T^{1.50}$, characteristic of radiative recombination not limited by surface or bulk nonradiative recombination processes. For the $Al_{0.4}Ga_{0.6}As$/GaAs and $Al_{0.5}In_{0.5}P$/GaAs heterostructures examined in this study, the upper limits of the interface recombination velocity were 210 and 900 cm/s, respectively.

3006 Structure determination of the Si(111):B($\sqrt{3}\times\sqrt{3}$)$R30°$ surface: Subsurface substitutional doping. Headrick, R.L. (AT&T Bell Laboratories, Murray Hill, New Jersey 07974 (US)); Robinson, I.K.; Vlieg, E.; Feldman, L.C. *Physical Review Letters (USA)*, 63(12): 1253-1256 (18 Sep 1989).

Synchrotron x-ray diffraction has been used to analyze the ($\sqrt{3}\times\sqrt{3}$)$R30°$ reconstruction of B/Si(111). Excellent agreement is obtained with in-plane data for a model in which boron sits in every third site of threefold symmetry. Out-of-plane diffraction, however, is only consistent with boron *below* the surface in the fivefold-coordinated substitutional site under a silicon T_4 adatom. The structure is confirmed by the growth behavior under room-temperature Si deposition in which the silicon adatom is displaced from its ordered site leaving boron in a two-dimensional ordered substitutional array.

3007 Band bending and oxygen-induced defects in *a*-Si:H. Winer, K. (Xerox Palo Alto Research Center, Palo Alto, California 94304 (US)). *Journal of Vacuum Science and Technology, B: Microelectronics Processing and Phenomena (USA)*, 7(5): 1226-1231 (Sep 1989).

Total yield photoelectron spectroscopy and Kelvin probe measurements are used to monitor the adsorption of activated oxygen onto clean hydrogenated amorphous silicon (*a*-Si:H) surfaces at submonolayer coverages. Oxygen adsorption induces up to 3×10^{12} cm^{-2} occupied near-surface gap states in a band centered 5.15 eV below the vacuum level and results in an 0.25-eV downward band bending at both slightly *n*-type and intrinsic *a*-Si:H surfaces. It is proposed that the downward band bending is due to the transfer of electrons from overcoordinated surface oxygen atoms to neutral defects native to *a*-Si:H, which form negatively charged deep states in a near-surface accumulation layer. The surface donor character of adsorbed oxygen is contrary to its usual strong electronegativity but is analogous to the donor character of overcoordinated phosphorus atoms in the *a*-Si:H bulk, which also lead to the creation of negatively charged deep states. Doping and deep defect formation in *a*-Si:H are discussed.

3008 Electric field response of a semiconductor superlattice optical mirror from electroreflectance spectra. Fritz, I.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185 (US)); Gourley, P.L.; Drummond, T.J. *Applied Physics Letters (USA)*, 55(13): 1324-1326 (25 Sep 1989). DOE Contract AC04-76DP00789.

We report low-field electroreflectance (ER) spectra of an all-semiconductor multilayer optical mirror structure. The structure, consisting of alternating blocks of AlAs/$Al_{0.5}Ga_{0.5}$ As and $Al_{0.5}Ga_{0.5}$As/GaAs multiple quantum well layers, was grown by molecular beam epitaxy without wafer rotation. Thickness variations across the wafer produce a position-dependent reflectance spectrum. The observed line shape of the band-edge exciton depends on its wavelength position relative to the mirror spectrum and cannot be explained by ordinary ER theory, due to the rapidly varying background mirror reflectance. Computer simulations, using the matrix method to calculate the reflectance for different layer thicknesses and exciton energies, agree qualitatively with the data. A strong enhancement in ER response is predicted near the minima in the mirror spectrum. This enhancement is important in electo-optic reflectance modulators.

3009 Scaling relations for strained-layer relaxation. Dodson, B.W. (Sandia National Laboratories, Albuquerque, New Mexico 87185 (US)); Tsao, J.Y. *Applied Physics Letters (USA)*, 55(13): 1345-1347 (25 Sep 1989). DOE Contract AC04-76DP00789.

Scaling relations for relaxation in strained-layer structures, based on simple descriptions of the dominant relaxation mechanisms and the influence of a stress-dependent relaxation activation energy, are obtained for general III-V semiconductor alloys. As a result, strained-layer relaxation in a given material system can be predicted over a wide range of structural parameters and temperature history based on a single relaxation measurement. This scaling treatment should prove useful in optimization of practical strained-layer device structures.

3010 Magnetic studies of persistent photoconductivity in *n*-$Al_xGa_{1-x}As$. Khachaturyan, K.A. (Department of Materials Science and Mineral Engineering, University of California and Center for Advanced Materials, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Awschalom, D.D.; Rozen, J.R.; Weber, E.R. *Physical Review Letters (USA)*, 63(12): 1311-1314 (18 Sep 1989). DOE Contract AC03-76SF00098.

Low-temperature magnetic susceptibility measurements were made during illumination of *n*-$Al_2Ga_{1-x}As$ with *DX* centers to investigate the microscopic origin of persistent photoconductivity. Experiments using a dc SQUID magneto-optic microsusceptometer revealed the change of electronic susceptibility as a function of illumination time and temperature. The results indicate that the *DX* center is a paramagnetic donor with one unpaired electron.

3011 Theory of unusual anisotropy of magnetoresistance in organic superconductors. Lebed, A.G. (L. D. Landau Institute of Theoretical Physics, Kosygina 2, Moscow, U.S.S.R. (SU)); Bak, P. *Physical Review Letters (USA)*, 63(12): 1315-1317 (18 Sep 1989). DOE Contract AC02-76CH00016.

We suggest that weak electron tunneling between layers is responsible for the experimentally observed dramatic deviations from two-dimensional behavior in the magnetoresistance in the metallic phase of the quasi-two-dimensional conductors $(TMTSF)_2ClO_4$ and $(TMTSF)_2PF_6$. We predict a fine structure due to resonances in open orbits between motion parallel and perpendicular to the planes.

3012 Temperature dependence of acceptor-hole recombination in germanium. Darken, L.S. (Tennelec, 601 Turnpike, Oak Ridge, Tennessee 37830 (US)); Jellison, G.E. Jr. *Applied Physics Letters (USA)*, 55(14): 1424-1426 (2 Oct 1989). DOE Contract AC05-84OR21400.

The recombination kinetics of several centers (Zn^-, Cu^-, B^-, CuH^-_2, CuH^-_x, $Zn^•$, $Cu^•$, and $CuH^•_x$) in high-purity Ge have been measured as a function of temperature from 8 to 160 K by transient capacitance techniques and are significantly faster than expected from cascade theory. The cascade theory also gives the wrong temperature dependence, and the wrong z dependence. Instead, the data are generally fit by the expression $N_v/4p\tau_c \cong kT/h$ (p and τ_c are, respectively, the free-hole concentration in the sample and the experimental mean capture time for a center).

3013 Antiphase domain boundary formation in single-crystal chalcopyrite-structure $ZnGeAs_2$ grown on GaAs. Solomon, G.S. (Research Triangle Institute, Research Triangle Park, North Carolina 27709-2194 (US)); Posthill, J.B.; Timmons, M.L. *Applied Physics Letters (USA)*, 55(15): 1531-1533 (9 Oct 1989).

Using transmission electron microscopy we have observed antiphase domain boundaries in single-crystal (001) $ZnGeAs_2$ grown on vicinal (100) GaAs by organometallic vapor phase epitaxy. These antiphase domains boundaries pertain only to the cation sublattice of the chalcopyrite-structure $ZnGeAs_2$ and are initiated at the heteroepitaxial interface because there exists a level of ordering on the cation sublattice in the $ZnGeAs_2$ epitaxial film that is absent in the GaAs substrate. There are two possible types of displacement vectors characterizing these antiphase domain boundaries, and a zinc-blende-structure substrate orientation to eliminate the boundaries is suggested.

3014 Amorphous phase formation by solid-state reaction between polycrystalline Co thin films and single-crystal GaAs. Shiau, F.Y. (Department of Materials Science and Engineering, University of Wisconsin, Madison, Wisconsin 57306 (US)); Chang, Y.A. *Applied Physics Letters (USA)*, 55(15): 1510-1512 (9 Oct 1989).

The formation of an amorphous phase between Co thin films and GaAs substrates by solid-state reaction has been investigated by transmission electron microscopy and Auger electron spectroscopy. The amorphization is ascribed to the fast diffusion of Co in GaAs. The amorphous layer, after a 300 °C, 4.5 h annealing, is measured to be ~40 nm in thickness and has a broad composition range. Prolonged annealing at 300 °C or heat treatment at 340 °C results in the crystallization of the amorphous phase. This crystallization is found to initiate from the Co/amorphous phase interface and leads to the formation of a metastable, supersaturated phase. Finally, the equilibrium condition is reached by the decomposition of this intermediate phase into CoGa and CoAs.

3015 Enhanced electron spin polarization in photoemission from thin GaAs. Maruyama, T. (Department of Physics, University of Wisconsin, Madison, Wisconsin 53706 (US)); Prepost, R.; Garwin, E.L.; Sinclair, C.K.; Dunham, B.; Kalem, S. *Applied Physics Letters (USA),* 55(16): 1686-1688 (16 Oct 1989). DOE Contract AC02-76ER00881;AC03-76SF00515;AC05-84ER40150.

The polarization of photoemitted electrons from thin GaAs layers grown by molecular beam epitaxy has been measured. Polarization as high as 49% was observed for a 0.2-μm-thick GaAs sample at excitation photon wavelengths longer than 750 nm. The maximum polarization is dependent on the thickness of the GaAs layer, decreasing to about 41% for a 0.9-μm-thick GaAs sample.

3016 Surface exponents of trails in two dimensions at tricriticality: Computer simulation study. Meirovitch, H. (Supercomputer Computations Research Institute, Florida State University, Tallahassee, Florida 32306-4052 (US)); Chang, I.S.; Shapir, Y. *Physical Review [Section] A: General Physics (USA),* 40(5): 2879-2881 (1 Sep 1989).

Using the scanning simulation method, we study self-attracting trails (with energy ϵ per intersection) terminally attached to an impenetrable linear boundary on a square lattice at their tricrital collapse transition. Our results for the exponents of the partition functions are γ_1=0.634±0.025 (one end attached to the surface) and γ_{11}=−0.44±0.02 (both ends attached). These values (with 95% significance limits) are within the error bars of the numerical estimates of Seno and Stella [Europhys. Lett. 7, 605 (1989)] for self-avoiding walks (SAW's) at the *FTHETA*-point on the same lattice. Our results, however, differ significantly from the exact values derived by Duplantier and Saleur for SAW's on a dilute hexagonal lattice at the *FTHETA'* point. The collapse temperature T_t and the tricritical growth parameter μ are very close to their analytic bounds $-\epsilon/k_BT_t$=ln3 and μ=3.

3017 Time resolved x-ray diffraction study of laser annealing in silicon at grazing incidence. Buschert, J.R. (Purdue University, Physics Department, West Lafayette, Indiana 47907 (US)); Tischler, J.Z.; Mills, D.M.; Zhao, Q.; Colella, R. *Journal of Applied Physics (USA),* 66(8): 3523-3525 (15 Oct 1989).

The loss of crystallinity at the surface of a silicon single crystal exposed to intense pulsed laser irradiation has been observed by means of a grazing incidence diffraction technique. The Bragg peak is shown to disappear during melting, and gradually reappear during subsequent stages of recrystallization.

3018 Interfacial roughness in InAs/GaAs heterostructures determined by soft x-ray reflectivity. Woronick, S.C. (Department of Physics, State University of New York at Stony Brook, Stony Brook, New York 11794-3800 (US)); Yang, B.X.; Krol, A.; Kao, Y.H.; Munekata, H.; Chang, L.L. *Journal of Applied Physics (USA),* 66(8): 3566-3573 (15 Oct 1989).

X-ray reflectivity has been used to determine interfacial roughness of as-grown 250-A-thick InAs overlayers deposited on GaAs substrates by molecular-beam epitaxy under differing growth and substrate conditions. Results indicate that in each case the top surface was smooth, but that the buried interface separating these highly lattice-mismatched materials exhibits root-mean-square roughness parameters in the range of 10–19 A. As-stabilized growth produced the roughest InAs-GaAs (buried) interface, while In-stabilized growth on a slightly misoriented substrate produced the smoothest InAs-GaAs interface.

3019 Electronic bonding of buried interfaces determined by soft x-ray emission spectroscopy. Perera, R.C.C. (Center for X-ray Optics, Accelerator and Fusion Research Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Zhang, C.H.; Callcott, T.A.; Ederer, D.L. *Journal of Applied Physics (USA),* 66(8): 3676-3681 (15 Oct 1989). DOE Contract AC05-84OR21400.

A nondestructive technique to study the partial density of states of atoms at buried interfaces is presented. A high density of interface atoms has been mimicked by using a periodic multilayer structure. The silicon-carbon interface was used as a test case. Fifty alternating silicon-carbon layers were laid down, in which silicon layers nominally between 3 and 30 A in thickness alternate with carbon layer pairs approximately 30 A thick made by magnetron sputtering. The silicon $L_{2,3}$ emission spectra was excited by monochromatized synchrotron radiation, and the *s*-like partial density of states of the silicon valence band was obtained. The spectrum of the thinnest silicon layer is similar to that of silicon as an impurity. When there are approximately two layers of silicon, the spectrum resembles that of silicon carbide, and as the layers become thicker, the spectrum is similar to that of amorphous silicon.

3020 Single layer $Al_2O_3{\cdot}H_2O$ and multilayer $Al_2O_3{\cdot}H_2O$–SiO_2 optical coatings prepared from colloidal suspensions. Thomas, I.M. (Lawrence Livermore National Laboratory, P.O. Box 5508, Livermore, California 94550 (US)). *Applied Optics (USA),* 28(18): 4013-4016 (15 Sep 1989). DOE Contract W-7405-ENG-48.

Single layer coatings of $Al_2O_3{\cdot}H_2O$ have been prepared on fused silica and BK-7 substrates from aqueous colloidal suspensions of hydrated alumina at room temperature. These coatings were porous and had a refractive index of ~1.44. Multilayer, high reflectivity, dielectric coatings were also prepared by laying down quarterwave-thick, alternating coats of this alumina with silica, also prepared from colloidal suspension, and having a refractive index of 1.22. To achieve 99% reflectivity, 30–35 layers were required. Single shot, laser damage threshold measurements at 1064 nm wavelength with a pulse length of 10 ns were carried out on both the single layer and multilayer system. The thresholds averaged 21 and 12 J/cm^2, respectively.

3021 Thermophysical properties of the lanthanide sesquisulfides. I. Schottky functions and magnetic and electronic properties of γ-La_2S_3, γ-Ce_2S_3, γ-Nd_2S_3, and γ-Gd_2S_3. Westrum, E.F. Jr. (Department of Chemistry, University of Michigan, Ann Arbor, Michigan 48109 (US)); Burriel, R.; Gruber, J.B.; Palmer, P.E.; Beaudry, B.J.; Plautz, W.A. *Journal of Chemical Physics (USA),* 91(8): 4838-4848 (15 Oct 1989). DOE Contract W-7405-ENG-82.

Heat capacity measurements of four lanthanide sesquisulfides La_2S_3, Ce_2S_3, Nd_2S_3, and Gd_2S_3, prepared in the γ phase, have been obtained between 6 and 350 K by adiabatic calorimetry. The total heat capacity has been resolved into lattice, electronic, magnetic, and Schottky components. The Schottky contributions agree well with the calculated values based on the observed splitting of the ground-state manifold of the rare earth ions occupying sites of S_4 symmetry in the Th_3P_4 structure. The observed splitting is obtained from an analysis of the hot bands in the absorption spectrum and from direct observation of the Stark levels in the far infrared. The Stark levels (all doublets) for Ce_2S_3 ($^2F_{5/2}$) are 0, 185, and 358 cm^{-1}; for Nd_2S_3($^4I_{9/2}$), they are 0, 76, 150, 180, and 385 cm^{-1}. For La_2S_3, which has no Schottky or magnetic contributions to the heat capacity, the thermal data can be extrapolated to 0 K. The entropy for La_2S_3 at 298.15 K (as S^0/R) is 19.51. Schottky and magnetic ordering at lower temperatures in Ce_2S_3, Nd_2S_3, and Gd_2S_3 preclude such extrapolation techniques. Therefore the entropy at 298.15 K for these compounds $\{S^0 - S^0(7\ K)\}/R$, is 21.34, 22.38, and 20.05, respectively.

3022 Integral equation theory of the structure and thermodynamics of polymer blends. Schweizer, K.S. (Sandia National Laboratories, Albuquerque, New Mexico 87185 (US)); Curro, J.G. *Journal of Chemical Physics (USA),* 91(8): 5059-5081 (15 Oct 1989). DOE Contract AC04-76DP00789.

Our recently developed RISM integral equation theory of the structure and thermodynamics of homopolymer melts is generalized to polymer mixtures. The mean spherical approximation (MSA) closure to the generalized Ornstein–Zernike equations is employed, in conjunction with the neglect of explicit chain end effects and the assumption of ideality of intramolecular structure. The theory is developed in detail for binary blends, and the random phase approximation (RPA) form for concentration fluctuation scattering is rigorously obtained by enforcing incompressibility. A microscopic, wave vector-dependent expression for the effective chi parameter measured in small angle neutron scattering (SANS) experiments is derived in terms of the species-dependent direct correlation functions of the blend. The effective chi parameter is found to depend, in

3023 Electron paramagnetic resonance investigations of divalent cobalt in single crystals of perovskite ($CaTiO_3$). Boldu O.,

J.L. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6056 (US)); Boatner, L.A.; Abraham, M.M. *Journal of Chemical Physics (USA)*, 91(8): 5117-5118 (15 Oct 1989). DOE Contract AC05-84OR21400.

The electron paramagnetic resonance (EPR) spectrum of Co^{2+} in $CaTiO_3$ was observed at 9 GHz in the temperature range of 10–15 K. The results establish that Co^{2+} occupies four magnetically inequivalent sites in the orthorhombic $CaTiO_3$ lattice. These sites become equivalent when the applied magnetic field is parallel to the so-called "pseudocubic" *b* axis of the crystal. The magnetic axes in the plane perpendicular to the pseudocubic axis make an angle of $\pm 28.5° \pm 0.5°$ with the *a* and *c* axes of the host lattice. The site symmetry is qualitatively similar to that of the aliovalent ions Er^{3+} and Yb^{3+} in $CaTiO_3$.

3024 Semiempirical modified embedded-atom potentials for silicon and germanium. Baskes, M.I. (Theoretical Division, Sandia National Laboratories, Livermore, California 94551-0969 (US)); Nelson, J.S.; Wright, A.F. *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6085-6100 (15 Sep 1989).

Semiempirical potentials for silicon, germanium, and their alloys are derived with use of the modified-embedded-atom-method formalism. Following Baskes [Phys. Rev. Lett. 59, 2666 (1987)], it is found that the host electron density which is a linear superposition of atomic densities in the embedded-atom method (EAM) must have an angular modification in order to properly describe the bond-bending forces in the diamond-cubic structure. The angular dependence of this host electron density was found to be in qualitative agreement with the density of a first-principles calculation. As in the EAM, the potential functions are determined by using the measured lattice constants, sublimation energies, elastic constants, and alloying energies of silicon and germanium. In addition, first-principles calculations of structural energies are used. The potentials are used to calculate the energetics and geometrics of point defects, surfaces, metastable structures, and small clusters. In all cases, the calculations have been compared to first-principles calculations and experiment when available. The calculations predict that the vacancy mechanism is the dominant diffusion mechanism in both silicon and germanium. Surface energies and relaxations of the low-index faces of Si and Ge are compared with first-principles calculations.

3025 Free-carrier absorption from Fibonacci sequences of δ-doped layers in silicon. Sernelius, B.E. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831 (US)). *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6218-6221 (15 Sep 1989). DOE Contract AC05-84OR21400.

Theoretical results are reported for the dynamical resistivity and free-carrier absorption from Fibonacci sequences of δ-doped layers in silicon. Distinct peaks develop, with increasing generation number, in the region of plasmon excitations and the spectra show self-similarity properties. Numerical results are presented for sequences with generation numbers 5, 10, and 15, corresponding to a total number of layers approximately equal to 10, 100, and 1000, respectively.

3026 Structural, electronic, and optical properties of polyacetylene from a total-energy local-density molecular-cluster approach. Ye, L. (Department of Physics and Astronomy and Materials Research Center, Northwestern University, Evanston, Illinois 60208 (US)); Freeman, A.J.; Ellis, D.E. *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6277-6284 (15 Sep 1989). DOE Contract FG05-85ER75215.

A self-consistent local-density total-energy molecular-cluster approach is used to study several fundamental structural, electronic and optical properties of *trans*- and *cis*-polyacetylene (PA). The use of extended basis sets in the linear combination of atomic orbitals (LCAO) representation and of accurate multipolar potential representations was found to be essential for obtaining accurate results. Chain clusters C_nH_{n+2} with increasing n=8, 12, 16, and 20 were investigated in order to assure convergence of physical quantities of interest. The ground-state density of states, energy gaps, and binding energies are obtained and compared with experimental results and results of other calculations. A gap of 1.68 eV is obtained for the *trans* case and 1.74 eV for *cis*. *trans*-PA is found to be a lower-energy state than *cis*-PA (by 0.1–0.2 eV per C_2H_2). Accompanying the Peierls transition from a metallic to semiconductor state, the dimerization energy is determined from optimized total-energy calculations on *trans*-PA to be about 0.02–0.03 eV/C_2H_2.

3027 Electronic structure of kink and kink-antikink defects in polyacetylene. Ye, L. (Department of Physics and Astronomy, Northwestern University, Evanston, Illinois 60208 (US)); Freeman, A.J.; Ellis, D.E. *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6285-6291 (15 Sep 1989). DOE Contract FG05-85ER75215.

The electronic energy levels and charge distribution associated with kink (K) and kink-antikink (K-$\bar{K}$) defects in polyacetylene have been calculated with use of the first-principles local-density-functional theory. Finite-chain models with up to 40 carbon atoms were studied, in a self-consistent-field molecular-orbital approach. For the kink defect on *trans*-polyacetylene (PA), a half-filled midgap level was found, which corresponds to a neutral soliton having spin 1/2. Its formation energy was found to be 0.51 eV. Two defect levels were found for kink-antikink pair constructed on both the *trans*- and *cis*-PA chains. In the *trans* case, the formation energy is about 1.1 eV, which remains almost constant with increasing separation between K and $\bar{K}$. The formation energy in the *cis* case increases monotonically with increasing separation and ranges from 0.3 eV for two intervening C atoms to 1.5 eV for 18 C atoms between K and $\bar{K}$.

3028 Silicide structural evolution in high-dose cobalt-implanted Si(100) crystals. Tan, Z. (Department of Physics and Institute of Materials Science, University of Connecticut, Storrs, Connecticut 06269-3046 (US)); Budnick, J.I.; Sanchez, F.H.; Tourillon, G.; Namavar, F.; Hayden, H.C. *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6368-6373 (15 Sep 1989).

The silicide structure in high-dose [(1–8)$\times 10^{17}$ Co/cm^2] cobalt-implanted Si(100) crystals is studied by extended x-ray-absorption fine structure, x-ray diffraction, and Rutherford backscattering spectrometry. As the implant dose increases we observe silicide structural evolution from a locally ordered $CoSi_2$ at a dose of 1×10^{17} Co/cm^2, to long-range-ordered $CoSi_2$ and CoSi at 3×10^{17} Co/cm^2, and to a short-range-ordered and highly defective CoSi-like structure at 8×10^{17} Co/cm^2. We propose a model in which Co atoms preferentially occupy the interstitial site, first in silicon then in $CoSi_2$, to understand the silicide-formation mechanism in the implanted system. The short-range-ordered silicides, observed for the first time, and the structural evolution are discussed in terms of both the $CoSi_2$ and CoSi structures and the proposed model. Single-phase and strongly oriented $CoSi_2$ are obtained in samples annealed at 700 °C.

3029 Lattice relaxation of *DX*-like donors in $Zn_xCd_{1-x}Te$. Khachaturyan, K. (Department of Materials Science and Mineral Engineering, University of California, Berkeley, California 94720 (US)); Kaminska, M.; Weber, E.R.; Becla, P.; Street, R.A. *Physical Review [Section] B: Condensed Matter (USA)*, 39(9): 6304-6310 (15 Sep 1989).

The configuration-coordinate diagram was constructed for deep relaxed In impurities in $Zn_xCd_{1-x}Te$. On the basis of the Hall effect, deep-level transient spectroscopy, photoionization, and photoluminescence measurements it was shown that In donors in $Zn_xCd_{1-x}Te$ possess analogous properties to the so-called *DX* center in $Al_xGa_{1-x}As$. The absence of paramagnetic resonance from In donors suggests that In atoms form a mixture of In^+ and In^{3+} ions, in equal numbers. A persistent photo-EPR signal from mobile photoelectrons was observed after illumination at g=1.316 and could be thermally annealed. A strong broad, donor-acceptor-pair luminescence was found, with periodically spaced phonon lines at high excitation powers.

3030 Morphology of Langmuir-Blodgett multilayers: A near-total external fluorescence and reflectivity study. Bloch, J.M. (Exxon Research and Engineering Company, Clinton Township, Annandale, New Jersey 08801 (US)); Yun, W.; Mohanty, K.M. *Physical Review [Section] B: Condensed Matter (USA)*, 40(10): 6529-6533 (1 Oct 1989). DOE Contract W-31-109-ENG-38.

X-ray reflection and near-total external fluorescence (NTEF) of Langmuir-Blodgett multilayers of stearate salt were found to be in significant disagreement with a simple-layered structure. The different samples contained one foreign Mn stearate double layer

deposited at a different predefined depth for each sample. A binary model of voids accumulated in successive layers is proposed. The lacunar structure for the multilayer that originates with this model fits our reflectivity and NTEF results remarkably well and resolves long-standing discrepancies between optical and x-ray measurements.

3031 Neutron-powder-diffraction study of the structure and antiferromagnetic ordering in Pr_2CuO_4. Cox, D.E. (Physics Department, Brookhaven National Laboratory, Upton, New York 11713 (US)); Goldman, A.I.; Subramanian, M.A.; Gopalakrishnan, J.; Sleight, A.W. *Physical Review [Section] B: Condensed Matter (USA)*, 40(10): 6998-7004 (1 Oct 1989). DOE Contract AC02-76CH00016.

A neutron-powder-diffraction study has been carried out on Pr_2CuO_4, which has the *T'*-type structure of the new high-T_c electron superconductors. The compound orders antiferromagnetically at about 270 K. The magnetic intensities at 15 K can be equally well accounted for by a collinear magnetic structure with orthorhombic symmetry or a noncollinear structure with tetragonal symmetry. In both cases, Cu moments are coupled antiferromagnetically within the CuO_2 layers, the ordered moment being $0.48\mu_B$ at 15 K. Rietveld refinement at 298 and 15 K shows the crystal structure is essentially unchanged; in particular, there is no detectable distortion at low temperature.

3032 Ground-state and optical properties of Cu_2O and CuO crystals. Ching, W.Y. (Department of Physics, University of Missouri-Kansas City, Kansas City, Missouri 64110 (US)); Xu, Y.; Wong, K.W. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7684-7695 (15 Oct 1989).

The band structures of cubic Cu_2O and monoclinic CuO crystals have been calculated by means of the first-principles orthogonalized linear combination of atomic orbitals method. Using the wave functions obtained, the frequency-dependent interband optical conductivities are also evaluated. The results show Cu_2O to be a direct-gap semiconductor, while CuO is semiconductorlike with an intrinsic hole population at the top of the valence band (VB). By comparing with a variety of existing data, we conclude that band theory works extremely well for Cu_2O, but is less satisfactory for CuO. This could be due to strong correlation effects for states near the top of the VB in CuO. A careful reanalysis of optical data and excitonic spectra in Cu_2O in conjunction with our calculations suggests a complete reinterpretation of these data. A clear distinction between the intrinsic gap and the optical gap is argued. We conclude that the intrinsic gap in Cu_2O is of the order of 0.8 eV, while the optical gap is of the order 2.0–2.3 eV. The excitonic series in Cu_2O is due to the Coulombic attraction of the hole at the top of the VB and the electron in the next-higher conduction band (CB), not the lowest CB, because of the forbidden symmetry associated with angular-momentum conservation. This reinterpretation of the excitonic data is also consistent with a calculated low value for the static dielectric constant ϵ_0 of order of 4 for Cu_2O.

3033 Pressure dependence of the *DX* center in $Ga_{1-x}Al_xAs$:Te. Shan, W. (Department of Physics, University of California, Berkeley, Berkeley, California 94720 (US)); Yu, P.Y.; Li, M.F.; Hansen, W.L. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7831-7838 (15 Oct 1989).

The pressure dependence of the *DX* center in Te-doped ternary alloy $Ga_{1-x}Al_xAs$ with x=0.15, 0.25, and 0.35 has been studied. The pressure coefficients of the activation energies for emission and capture as well as the pressure coefficient of the thermal ionization energy were found to change sign when the band gap of $Ga_{1-x}Al_xAs$ changed from direct to indirect. The compositional dependence of these energies at atmospheric pressure has also been extrapolated from the pressure dependence. Similarities between the effects of changing pressure and Al mole fraction suggested that the properties of the *DX* center depend mainly on the host semiconductor conduction-band structure. The difference in the pressure dependence of the *DX* center when the band gap is direct as opposed to indirect suggests that the defect wave function has considerable contribution from the conduction-band minima near the *X* point of the Brillouin zone and not just from the *L*-point minima as has been proposed by many authors.

3034 Electrons and phonons in polymeric sulfur nitride. Springborg, M. (Nordisk Institut for Teoretisk Atomfysik (NORDITA), Blegdamsvej 17, DK-2100 Kobenhavn O, Denmark (DK)). *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7928-7938 (15 Oct 1989).

Results of first-principles calculations on a large number of geometries of a single, isolated, planar, periodic, infinite $(SN)_x$ chain are reported. The results are used in theoretically determining all four geometrical parameters, the single-particle energy bands, as well as frequencies and displacement patterns for frozen, zone-center, intrachain, in-plane phonons. The calculated values are compared with those derived from experiments and from other theoretical approaches. Finally, couplings between the electronic orbitals at the Fermi level and intrachain phonons are discussed.

3035 Near-edge x-ray-absorption fine-structure spectroscopy investigation of poly(ethylene oxide)-KI complexes. Yang, X.Q. (Department of Applied Science, Brookhaven National Laboratory, Upton, New York 11973-6000 (US)); Chen, J.M.; Skotheim, T.A.; Okamoto, Y.; Kirkland, J.; denBoer, M.L. *Physical Review [Section] B: Condensed Matter (USA)*, 40(11): 7948-7952 (15 Oct 1989). DOE Contract AC02-76CH00016.

We have measured the near-edge x-ray-absorption fine-structure spectra of the *K* edge of potassium in the polymer-salt complex poly(ethylene oxide)-KI. Changes are observed as a function of temperature due to modifications of the K-ion coordination. Comparison with model systems suggests that the lower activation energy of this ionic conducting polymer complex at elevated temperature (T>70 °C) is partially due to reduced oxygen complexation of the K ions.

3036 Low density microcellular carbon foams and method of preparation. Arnold, C. Jr.; Aubert, J.H.; Clough, R.L.; Rand, P.B.; Sylwester, A.P. To Dept. of Energy, Washington, DC. USA Patent 4,832,881. 23 May 1989. Filed date 20 Jun 1988. Int. Cl. C10B 31/00. vp Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

A low density, open-celled microcellular carbon foam is disclosed which is prepared by dissolving a carbonizable polymer or copolymer in a solvent, pouring the solution into a mold, cooling the solution, removing the solvent, and then carbonizing the polymer or copolymer in a high temperature oven to produce the foam. If desired, an additive can be introduced in order to produce a doped carbon foam, and the foams can be made isotropic by selection of a suitable solvent. The low density, microcellular foams produced by this process are particularly useful in the fabrication of inertial confinement fusion targets, but can also be used as catalysts, absorbents, and electrodes.

3037 Protective coating for alumina-silicon carbide whisker composites. Tiegs, T.N. To Dept. of Energy, Washington, DC. USA Patent 4,839,316. 13 Jun 1989. Filed date 26 Oct 1987. 6p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

Ceramic composites formed of an alumina matrix reinforced with silicon carbide whiskers homogenously dispersed therein are provided with a protective coating for preventing fracture strength degradation of the composite by oxidation during exposure to high temperatures in oxygen-containing atmospheres. The coating prevents oxidation of the silicon carbide whiskers within the matrix by sealing off the exterior of the matrix so as to prevent oxygen transport into the interior of the matrix. The coating is formed of mullite or mullite plus silicon oxide and alumina and is formed in place by heating the composite in air to a temperature greater than 1200°C. This coating is less than about 100 microns thick and adequately protects the underlying composite from fracture strength degradation due to oxidation.

3038 Carbonaceous film coating. Maya, L. To Dept. of Energy, Washington, DC. USA Patent 4,833,034. 23 May 1989. Filed date 26 Apr 1988. USA Patent Application 7,186,427. Int. Cl. C23C 16/26. 6p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a method of making a carbonaceous film. It comprises heating tris(1,3,2-benzodiazaborolo)borazine or dodecahydro tris[1,3,2]diazaborine[1,2-a:1'2'-c:1"2"-e]borazine in an inert atmosphere in the presence of a substrate to a temperature at

which the borazine compound decomposes. The decomposition products deposit onto the substrate to form a thin, tenacious, highly reflective conductive coating having a narrow band gap which is susceptible of modification and a relatively low coefficient of friction.

3039 (AEEW-R–2227) **Matrix isolation-infrared and mass spectrometric studies of high-temperature molecules.** Dickinson, S. UKAEA Atomic Energy Establishment, Winfrith (UK). Chemistry Div. Aug 1987. 56p. Order Number DE90607900. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

Matrix isolation-infrared spectroscopy and mass spectrometry have been developed at AEE Winfrith to study the high-temperature vapour species which could be generated during a hypothetical severe reactor accident. The principles of the techniques and the instruments are described in detail, and examples of their application to specific systems discussed. Although these examples refer to high-temperature chemical species which are relevant to reactor safety assessments, the techniques are equally applicable to other processes where the characterisation of transient vapour-phase species is required. 3041 (CONF-8910287–1) **The effects of heavy metals on the scaling ability of $CaCO_3$ and $Mg(OH)_2$.** Peters, R.W.; Wentz, C.A. Argonne National Lab., IL (USA). 1989. 6p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract W-31109-ENG-38. From 1. regional meeting of the American Filtration Society; Houston, TX (USA); 30 Oct - 1 nov 1989. Order Number DE90002845. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Hard water (containing cations, primarily calcium and magnesium) can result in scaling (deposition) problems in heat exchange equipment and water distribution systems. In many municipalities, hard water is softened by precipitation, in which lime or soda ash is added to the hard water to precipitate calcium carbonate or magnesium hydroxide. The presence of heavy metals is known to affect the growth and nucleation of $CaCO_3$ and $Mg(OH)_2$ in continuous reactors. In this study, we examined the effects of four heavy metals (cadmium, lead, iron, and zinc) on the scaling ability of the $CaCO_3$–$Mg(OH)_2$ system in a mixed suspension/mixed product removal (MSMPR) crystallizer (reactor). The objectives of the study were to: measure the efficiency of hardness removal in the presence of heavy metals; measure the efficiency of heavy metal removal by the lime-soda ash water softening process; monitor the crystal morphology of the precipitates; measure the precipitation kinetics through a population balance analysis for the $CaCO_3$ system in the presence of heavy metals; and determine the scaling ability of the $CaCO_3$/$Mg(OH)_2$ system in the presence of heavy metals at various pH values. 8 refs., 5 figs., 1 tab.

3042 (IAERU–8802, pp. 119-130) **Neutron radiography application to archaeological and ethnological objects.** Masuzawa, Fumitake (Gango-ji Inst. for Research of Cultural Property, Ikoma, Nara (Japan)). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Mar 1989. (In Japanese). (CONF-8806441–: 4. IAERU seminar, Tokyo (Japan), 18 Jun 1988). In *Proceedings of IAERU seminar-4.* Order Number DE90705939. Available from NTIS (US Sales Only), PC A07/MF A01.

Neutron radiography testing (NRT) has been applied to several ancient relics using Kyoto University Research Reactor and the cyclotron-based facility of Sumitomo Heavy Industries, Ltd. Some of the results are presented with comments on the usage and applicability of NRT in researches of ancient cultural property. The objects studied are (1) unearthed Buddhist sutras in a bronze case, (2) unearthed glass beads, a silver hollow bead ball and string in a gilt copper alloy case with a lid, (3) a Tibetan Buddhist clay statue cushioned with cloth in a copper box with a glass window and (4) an excavated iron sword conserved and restored using synthetic resins. From comparisons with X-ray radiography testing, NRT is remarkably effective to distinguish organic objects from inorganic materials such as metals and pottery. (author).

The basement is formed by the JAMARI COMPLEX high-grade terrains, which were intensily reworked in the Rondoniano Mobile Belt related period, by 1,500 m.y. ago. In the Jamari stratigraphic unit a Rb-Sr true isochrone has been obtained in the Ariquemes granulites giving 1,495 +- 38 m.y. with IR = 0,7086 +- 0.0007. Proterozoic metasedimentary sequences are only preserved in the Guajara-Mirim (Yata) region and in the surroundings of the Formoso river, by the COMEMORACAO GROUP. This medium-grade unit consists of a aluminous sedimentary sequence with NE-SW to E-W structural trend. In the Yata settlement a Rb-Sr true isochrone has been abtained, giving 1,157 +- 40 m.y., with IR=O.7189 +- 0.0021, which suggests that it has been affected by the Sunsas Mobile Belt. The remainders of a low-grade sequence derived from psamitic-pelitic sediments are also exposed in the FORTALEZA DO ABUNA GROUP, with pronounced NW-SE structural trend. The region was lately the ground for deposition of mainly continentally derived sediments, although marine facies and volcanics are associated, owing to the rifting and deposition of the MUTUM-PARANA and PALMEIRAL FORMATIONS. These events were followed by the emplacement, by 1,300 to 950 m.y. ago. of both, plutonic and basic volcanic rocks, of the CIRIQUIQUI INTRUSIVE SUITE and NOVA FLORESTA FORMATION. Simultaneously to the basic activity, a large intensive volcanic-plutonic activity took place randing from 1,350 to 950 m.y., represented by the RONDONIA INTRUSIVE SUITE, CARIPUNAS FORMATION acid volcanics and ALCALINAS TEOTONIO related intrusives. Rb-Sr true isochrones have been obtained in the RONDONIA INTRUSIVE SUITE granites of the Samuel Dam region (1,381 +- 122 m.y., IR = 0.7126) and Periquitos (1,297 +- 170 m.y., IR = 0,7100 +- 0.0137). (author).

3045 (INIS-BR–1699) **Addition compounds between trifluoromethanessulfonates and N,N-Dimethylacetamide (DMA).** Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1984. 141p. (In Portuguese). Order Number DE90607887. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Rare-earth complex ions were prepared using dissolution of hydrated lanthnide compounds in the species used as ligand, N,N-dimethylacetamide (DMA) followed by evaporation of the ligand excess, and by crystallization of the dissolved complexes in DMA medium using chloroform as precipitating agent. (M.J.C.).

3046 (INIS-BR–1700) **Development of sequential analytical method for the determination of U-238, U-234, Th-232, Th-230,**

Th-228, Ra-226 and Ra-228 and its application in mineral waters. Costa Lauria, D. da. Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Quimica. 1986. 117p. (In Portuguese). Order Number DE90607849. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

A sequential analytical method for the determination of U-238, U-234, Th-232, Th-230, Th-228, Ra-226 and Ra-228 in environmental samples and applied to the analysis of mineral waters is studied. Thorium isotopes are coprecipitated with lanthanium fluoride before counting in alpha spectrometer, the uranium isotopes are determined by alpha spectrometry following extraction with TOPO onto a polymenic membrane. Radium-226 is determined with the radom emanation technique. (M.J.C.).

Published in summary form only.

3055 (INIS-BR–1754) **Spectrophotometric investigation of addition compounds between neodymium (III) and europium (III) perchorates and hexafluorophosphate and cyclic ligants with two oxygen in opposite position.** Oliveira, M.A.S. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1986. 342p. (In Portuguese). Order Number DE90607852. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Addition compounds between Nd^{3+} and Eu^{3+} perchlorates and hexafluorophosphates with trans-1,4-dithino-1,4-dioxide (TDTD), pyrazine-1,4-dioxide (pyzDO), 2,5 - piperazinedione (pdo) and 1-4-diazabicyclo /2,2,2/-octane-1,4-dioxide or triethylenediamine dioxide (TEDADO) were prepared. The lanthanide content was determined by complexometric titration with EDTA. Carbon, hydrogen and nitrogen were determined by microanalytical procedures and water by the Karl Fischer method. The following stoichiometries were determined: $Nd(ClO_4)_3.6TDTD.8H_2O$; $Eu(ClO_4)_3.6TDTD.4H_2O$; $Ln(PF_6)_3.4TDTD.4H_2O$; $Ln(ClO_4)_3.4pyzDO$; $Ln(ClO_4)_3.4pdo$; $Ln(ClO_4)_3.3TEDADO.3H_2O$; $Ln(PF_6)_3.3TEDADO.3H_2O$ (Ln = Nd^{3+} and Eu^{3+}). X-ray powder patterns of the perchlorates show that the compounds of neodymium and europium with the respective ligands are isomorphous. The samme occurs in relation to Nd^{3+} and Eu^{3+} hexafluorophosphates. The results of the infared spectra, Raman spectra, absorption electronic spectra and fluorescence electronic spectra are also presented. (author).

3056 (INIS-BR–1760) **Simultaneous determination of Rn-220 and Rn-222 concentrations in atmospheres by cellulose nitrate ionographic detectors.** Lobao, N. Universidade Federal, Rio de Janeiro, RJ (Brazil). Inst. de Biofisica. 1977. 139p. (In Portuguese). Order Number DE90607853. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

A method for the indoor determination of airborne radon and radon daughters is described, based in the utilization of cellulose nitrate (CN) ionographic detectors (LR-115-Kodak-Pathe) These track-etching detectors are coupled to an air sample and to a difusion chamber respectively. In the first system ambient air is pulled through a fiber glass filter for collection of airborne radon daughters (Flow: 230 ml/min). In the second system, the cellulose nitrate detectors is coupled to a diffusion chamber electrostatic precipitator arrangement. Here the CN detector will register only the alpha particles given off by the decay products of Rn-222 formed within the sensitive volume of electrostatic precipitator. The construction of calibration curves for the two systems using adequate steady-state concentrations of Rn-220 and Rn-222 in an exposure chamber (1 cubic meter), will allow the use of the system for measurement of measurement of averaged integrated radon concentrations. The CN attached to the CN attached to the air sampler is exposed in the reference atmosphere with and without a mylar filter for discrimination of alpha particles with different energies Field sampling indicated however, that efficiency of the two systems are still low for

the measurement of environmental levels of Rn-220 and Rn-222 within houses of the AENR, recommendations for efficienty improvement of the system are proposed.

3057 (INIS-BR–1768) **Dating of aragonite and dolomite from Devil's cave - SP, by dosimetric thermoluminescent method (DTL) and ESR.** Tatumi, S.H. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1987. 114p. (In Portuguese). Order Number DE90607854. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

We have investigated TL (Thermoluminescence) and ESR (electron spin resonance) properties of aragonite and dolomite found at "Caverna do Diabo (Devil's cave)" in the state of Sao Paulo to determine the ages of these geological materials. The aragonite, which is not a thermoluminescent material, shows one ESR signal whit g = 2.003. We obtained the age of 1.1 x 10^5 years and the growth rate of 1 μ m/year by the sample calibration with additional Y irradiation. The dolomite gives a TL glow curve with three distinct peaks at 261, 334 and 395 ^{0}C. We found that the fit for the TL glow curve to second-order kinetics can be considerered as very acceptable. Using the second TL peak we obtained the age of 9.4 x 10^5 years and the compatible values of the activation energy (1.90 +- 0,07 eV) by the following methods: Hyperbolic heating, isothermal decay and fractional glow technique. We observed many ESR absorption signals in the dolomite. Three principal signal com g = 2.002, 2.003 and 2.005 were studied. We found that the first and second ESR signals were atributed to the CO_2^- and/or CO_3^{3-} centers and the last to the CO_3^- centers, and observed that the first ESR signal might related with the second TL peak and the TL sensitivity were associated with the concentration of Mn^{2+}.

3058 (INIS-BR–1770) **Study for the determination of samarium, europium,terbium, dysprosium and yttrium in gadolinium oxide matrix by means of atomic absorption spectrophotometry using a graphite furnace.** Caires, A.C.F. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). 1985. 121p. (In Portuguese). Order Number DE90607893. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

A study for determination of samarium, europium, terbium, dysprosium and yttrium in a gadolinium oxide matrix by atomic absorption spectrophotometry using a graphite furnace is presented. The best charrring and atomization conditions were estabilished for each element, the most convenient ressonance lines being selected as well. The study was carried out for the mentioned lanthanides both when pure and when in binary mixtures with gadolinium, besides those where all for them were together with gadolinium. The determination limits for pure lanthanides were found to be between 1.3 and 9.6 ng assuming a 20% relative standard deviation as acceptable. The detection limits were in the range 0.51 and 7.5 ng, assuming as positive any answer higher than twofold the standard deviation. (author).

Optically stimulated luminescence is investigated as age indicator of sediments. (orig.).

3062 (Juel–2212) **Biological materials residues from pressurized decomposition with nitric acid. Identification of reaction products and their impact on inverse voltammetric element analysis.** Wuerfels, M. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Angewandte Physikalische Chemie; Bochum Univ. (Germany, F.R.). Jul 1988. 219p. (In German). Order Number DE90721938. Available from NTIS (US Sales Only), PC A10/MF A01.

This work mainly investigates the influence of organic residues from the pressurized decomposition of biological materials on the current of inverse voltammetric trace signals. The emphasis lies on the following subtasks: 1. optimization of the parameters for the pressurized decomposition with hydrochloric acid at temperatures of up to 200^{0}C using selected sample materials. 2. Experiments on the aftertreatment of organic residues with perchloric acid. 3. Experiments on the pressurized decomposition with nitric acid at temperatures of up to 300^{0}C using a self-built system and the commercial high-pressure incinerator according to Knapp. 4. Examination of the voltammetric diagrams of decomposition liquors for possible disturbances in the determination of Zn, Cd, Pb and Cu. 5. Experiments on the isolation of the decomposition residues of different sample materials and on the identification of the undecomposed substances. 6. Investigations on the mechanism of the disturbance of electrochemical reactions caused by decomposition residues. 7. Investigations on the mechanism of the decomposition of biological material by way of pressurized decomposition with nitric acid. (orig./RB).

3063 (KCP–613-4127) **High-temperature gel-permeation chromatography of poly(4-methyl-1-pentene).** Fuller, E.N.; Edwards, G. Jr. Allied-Signal Aerospace Co., Kansas City, MO (USA). Kansas City Div. 1989. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. (CONF-8908176–1: Waters '89: international GPC symposium, Newton, MA (USA), 28 Aug 1989). Order Number DE90002967. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A high-temperature gel-permeation chromatographic (HTGPC) method has been developed for molecular weight (MW) characterization of poly (4-methyl-1-pentene), PMP. Like most high-MW polyolefins, PMP is difficult to handle because of solubility problems. Techniques for overcoming the solubility problems are discussed. The effects of sample concentration and of extended analysis temperature exposure on the results obtained by HTGPC were investigated. Thermo-oxidative degradation of the polymer could be readily observed despite the addition of an antioxidant and thermal stabilizer to the carrier solvent. The rate of degradation for PMP appeared to be greater than for polypropylene (PP) or for polyethylene (PE) as was expected based on the branched structure of PMP. Efforts to reduce degradation are described. Results for two commercial grades of PMP, one in pellet form for injection molding and another in bar stock form for machining, are presented. Results from two in-house developmental PMP type resins are compared with those from the pellet type. 8 refs., 12 figs.

3064 (KFK–4622) **Analytical studies of plutonium containing solutions by Laser-Raman-Spectroscopy (LRS) with special regard to the Pu(IV)-Ru(III)-HNO_3 and Pu(VI)-H_2O_2-reactions.** Freudenberger, M. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Chemie. Aug 1989. 139p. (In German). Order Number DE90722448. Available from NTIS (US Sales Only), PC A07/MF A01.

In spent nuclear fuel reprocessing by the Purex process it is attempted to apply as far as possible automated analytical equipment, which is directly coupled to the process stream. This paper describes the optical coupling of Laser-Raman-Spectroscopy (LRS) with commercial fiber optics in a 90^0 geometry to a test apparatus within a glovebox. It was possible to show that in nitric acid solutions Pu(VI), Pu(V), U(VI), and nitrate can be detected simultaneously without interference. The suitability of LRS for the Pu(VI)

and Pu(V) detection was demonstrated by the example of two reactions, namely the oxidation of Pu(IV) to Pu(VI) in nitric acid solution in the presence of Ru(NO)-complexes and the reduction of Pu(VI) to Pu(V) by H_2O_2. In the study of the Pu(IV)-Ru(NO)-reaction the temperature and the concentrations of the individual reactants were varied and in addition the concentration of F^-, which as a strong complexing agent for Pu(IV) exerts a considerable influence on the reaction rate. The results of these experiments were used to estimate the reaction orders for the individual reactants by the method of initial rates. The course of the reduction of Pu(VI) to Pu(V) with H_2O_2 was studied for different temperatures, pH-values and F^--concentrations. (orig./RB).

3065 (PB–89-871230/XAB) **Membrane gas separation. January 1970-September 1989 (Citations from the NTIS data base). Report for January 1970-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 66p. Available from NTISPC N01/MF N01.

Supersedes PB–88-868641.

This bibliography contains citations concerning the research and development of gas separation and purification utilizing plastic and metal membranes. Among the topics included are isotope separation, osmotic techniques, reverse osmosis, and preparation of membranes for specific separation processes. The permeability of polymer membranes is discussed in terms of physical properties as well as molecular structure. The selectivity of polymeric films for a variety of gases is also included. (This updated bibliography contains 100 citations, 18 of which are new entries to the previous edition.)

3066 (PCCF-T–88-16) **Elementary analysis by means of the x fluorescence and energy dispersion.** Jbeli, H. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. Oct 1988. 194p. (In French). Order Number DE90721244. Available from NTIS (US Sales Only), PC A09/MF A01.

Three actualisation reports are shown, in the three first chapters, concerning the following subjects: x fluorescence principle, energy dispersive X ray spectroscopy and excitation spectrum characteristics. The matrice effects, the energy equivalence concept, and the correction methods of the interelement effects, related to a calibration curve, are discussed. For the last ones, it is shown that they are supplied to rough values. Quantitative analysis results are shown. A new possibility has been added to those of data processing program usually applied in quantitative analysis. In the second method applied in quantitative analysis, standard samples are used. In both methods an error appreciation analysis is carried out. It is shown that energy dispersive X fluorescence analysis can be applied to thin layers composition and thickness characterization.

3067 **Polarization spectroscopy in analytical measurements.** Yeung, E.S. (Department of Chemistry and Ames Laboratory, Iowa State University, Ames, Iowa 50011 (US)). *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 764-769 (1 Oct 1988). Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

A new generation of instruments has been developed for using the polarization properties of light in sensitive and selective chemical measurements. The detection of rotation of the plane of polarization of light is at the micro degree level. The detection of the intensity differences between left and right circularly polarized light is at the parts-per-million level. These are orders of magnitude better than commercial instruments can provide.

3068 (AEEW-R–2305) **Characterisation of molecular boric acid by mass spectrometry and matrix isolation-infrared spectroscopy.** Ogden, J.S.; Young, N.A.; Bowsher, B.R. UKAEA Atomic Energy Establishment, Winfrith (UK). Chemistry Div. Oct 1987. 37p. Order Number DE90607901. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Boric acid (H_3BO_3) is used as a soluble neutron absorber in the coolant of pressurised water reactors and will be an important species in defining the fission product chemistry of severe reactor accidents. Mass spectrometry and matrix isolation-infrared spectroscopy have been used to characterise boric acid in the vapour phase and hence assess the implications of any chemical interactions. Crystalline orthoboric acid vaporises to yield molecular H_3BO_3 when heated in vacuum to approximately 40^0C. The infrared spectrum of the vapour species isolated in low-temperature nitrogen matrices shows characteristic absorptions at 3668.5 (E'), 1426.2 (E'), 1009.9 (E'), 675.0 (A"), 513.8 (A") and 448.9 (E') cm^{-1}, consistent with C_{3h} symmetry. These spectral assignments are supported by extensive isotope labelling, and by a partial normal co-ordinate analysis. These data will be used to quantify specific thermodynamic functions and hence assist in determining the magnitude of reactions such as boric acid with caesium iodide. (author).

3069 (AEEW-R–2341) **New estimates for the thermodynamic functions of molecular boric acid.** Bowsher, B.R.; Dickinson, S.; Ogden, J.S.; Young, N.A. UKAEA Atomic Energy Establishment, Winfrith (UK). Chemistry Div. Mar 1988. 9p. Order Number DE90607902. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Orthoboric acid (H_3BO_3) is used as a soluble neutron absorber in the coolant of pressurised water reactors and will be an important species in defining the fission product chemistry of severe reactor accidents. New thermodynamic data are presented for molecular boric acid, which are based almost entirely on matrix isolation-infrared experimental observations. In general, it is found that over the temperature range 500 to 1500K, the specific heat and absolute entropy show differences of approximately 5% compared with the JANAF tabulations. As a consequence of these calculations, the reaction between caesium iodide and boric acid is predicted to be more favoured than previously considered, and this conclusion confirms experimental studies on this system. (author).

3070 (BNL–42573) **Atomic mass measurements with radioactive beams and/or targets: Where to start.** Haustein, P.E. Brookhaven National Lab., Upton, NY (USA). [1989]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8909247–3: ACS symposium on exotic nuclear spectroscopy, Miami Beach, FL (USA), 11-15 Sep 1989). Order Number DE90001532. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Radioactive beams or radioactive targets (or both) can significantly increase the yields of exotic isotopes, allowing studies to be performed in regions which are currently inaccessible. An important goal to pursue with these exotic species is a broad program of nuclidic mass measurements. This is motivated by the observation that mass model predictions generally diverge from one another in regions far from beta-decay stability where well measured masses are sparse or nonexistent. Stringent tests of mass models are therefore possible and these can highlight important features in the mass models that affect the quality of their short-range and long-range extrapolation properties. Selection of systems to study can be guided, in part, by a desire to probe those regions where distinctions among mass models are most apparent and where exotic isotope yields will be optimal. Several examples will be presented to highlight future opportunities in this area. 10 refs., 5 figs.

3071 (BNL–43214) **Direct insertion of metal ions into tetrasulfonated phthalocyanine.** Linkous, C.A.; Shea, C.E.; Jaber, M.R.A. Brookhaven National Lab., Upton, NY (USA). Jul 1989. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE90002458. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A series of metal salts were reacted with aqueous solutions of the tetrasulfonated free base phthalocyanine (H_2TsPc) in an attempt to prepare the corresponding metal TsPc derivative by direct insertion instead of the usual template reaction in a urea melt. Spectrophotometric analysis showed that Ni^{2+}, Cu^{2+}, Zn^{2+}, Co^{2+}, Fe^{2+}, Mn^{2+}, Pd^{2+}, Cd^{2+}, and Sn^{2+} could be successfully inserted; higher oxidation states as well as Pb^{2+} caused precipitation. Reducing species

such as Cr^{2+} and V^{2+} reduced H_2TsPc but did not insert; Sn^{2+} inserted with formation of an air-sensitive intermediate species. Mg^{2+}, VO^{2+}, Pt^{2+}, and Hg^{2+} were unreactive. It is recommended that insertion may be the preferable method for synthesis of the MTsPc's listed above when air sensitivity, reaction time, and microscale are important issues in an overall synthetic scheme. 24 refs., 4 figs.

3072 (CONF-890756–3) **Corrections for non-ideal effects in reflected shock waves at low Mach numbers.** Michael, J.V.; Fisher, J.R. Argonne National Lab., IL (USA). 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 17. international symposium on shock waves and shock tubes (STS-17); Bethlehem, PA (USA); 17-21 Jul 1989. Order Number DE90002192. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Recent and new Flash Photolysis-Shock Tube results are reviewed and are compared to lower temperature results on the same reactions using a recently described procedure for boundary layer corrections in the reflected shock regime. A comparison is also made to the lower temperature results when the data bases are alternatively analyzed by ideal shock wave theory. 20 refs., 7 figs.

3073 (CONF-891013–7) **Molecular clustering in supercritical solutions.** Cochran, H.D.; Wu, R.-S.; Lee, L.L. Oak Ridge National Lab., TN (USA). [1989]. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 6. symposium on separation science and technology for energy applications; Knoxville, TN (USA); 22-27 Oct 1989. Order Number DE90002480. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We present results on the size and radial profile of solvent-solute clusters and on solute-solute aggregation for systems representative of typical dilute, attractive, supercritical solutions calculated from integral equation theories. The microstructure of theoretically-predicted dilute, repulsive, supercritical solutions exhibits a deficit of solvent molecules surrounding the solute. Solute partial molar volume and chemical potential are predicted to increase dramatically in such repulsive mixtures as density is increased toward the critical point at slightly supercritical temperatures. 32 refs., 8 figs.

3074 (DOE/ER/13295–3) **Transition metal catalyzed transformations of unsaturated molecules.** Pennsylvania State Univ., University Park, PA (USA). [1989]. 69p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER13295. Order Number DE90002767. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

In this proposal, research in three areas of transition metal catalyzed transformations of small molecules is proposed. The first encompasses metal catalyzed processes for the synthesis of several classes of carbon monoxide containing polymers. This section describes plans for metal catalyzed synthesis of (a) new alternating copolymers of carbon monoxide and olefins, (b) block copolymers consisting of segments of the olefin homopolymer and the olefin-carbon monoxide alternating copolymer, and (c) polycarbonates, polyesters and polyamides. The second section involves the examination of the chemistry of metal complexes incorporating oxo and hydrocarbyl ligands as a model for the heterogeneous oxidation of olefins and alkanes by meal oxides. Specific plans are to mimic in solution two proposed key steps in the heterogeneous oxidations. These are (a) the heterolytic cleavage of an alkyl (or allyl) C-H bond that is assisted by an oxo group, and (a) the transfer of an oxo group to the resultant metal bound alkyl (or allyl) ligand. The third section concerned with the development of a hybrid catalyst system involving both homogeneous and heterogeneous components for the oxidative functionalization of alkanes. The basic idea is to employ a transition metal in the elemental state to activate C-H bonds of alkanes and form surface alkyl groups. An additional transition metal species will be present in solution which will serve to oxidize these surface alkyl groups to ultimately yield oxidatively functionalized organic products. 57 refs.

3075 (DOE/ER/13855–2) **Stable isotope studies: Progress report, October 1988–October 1989.** Ishida, Takanobu. State Univ. of New York, Stony Brook, NY (USA). Dept. of Chemistry. 23 Oct 1989. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER13855. Order Number DE90002882. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have been engaged in the experimental and theoretical studies in two subfields of isotope science and technology this year; (1) studies of electric-potential-assisted heterogeneous catalysis (EPAC) of hydrogen isotope exchange reaction between water and dihydrogen and (2) studies of liquid ammonia systems. Since our activities in Category 1 above have branched out into many directions, what we have done and what we currently plan to do in this area have been summarized in a chart. Some deviations of our activities from the original plan are noted. There have been no principal change in the scope of our scientific activities. Some details of progress other than those already published or submitted for publication are reported.

3076 (INIS-BR–1698) **Cholesteric lyomesophases based on sodium N-lauroyl asparte: characterization of new system by nuclear magnetic resonance and polarizing microscopy.** Melo, M.V.M.C. de. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1982. 147p. (In Portuguese). Order Number DE90607262. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Lyomesophases based on di-sodium N-lauroyl aspartate (SNLA), bi-carboxilated amphiphile obtained from the reaction of n-lauroyl chloride with aspartic acid in racemic or levo form are studies. The different mesophases were characterized by ^2H and ^{23}Na NMR and by polarizing microscopy. (M.J.C.).

3077 (LBL–27937) **Quantum mechanical reactive scattering theory for simple chemical reactions: Recent developments in methodology and applications.** Miller, W.H. Lawrence Berkeley Lab., CA (USA). Aug 1989. 9p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00098. CHE84-16345. (CONF-890708–10: 16. international conference on the physics of electronic and atomic collisions, New York, NY (USA), 26 Jul - 1 aug 1989). Order Number DE90003120. Available from NTIS, PC A; OSTI; INIS; GPO Dep.

It has recently been discovered that the S-matrix version of the Kohn variational principle is free of the "Kohn anomalies" that have plagued other versions and prevented its general use. This has made a major contribution to heavy particle reactive (and also to electron-atom/molecule) scattering which involve non-local (i.e., exchange) interactions that prevent solution of the coupled channel equations by propagation methods. This paper reviews the methodology briefly and presents a sample of integral and differential cross sections that have been obtained for the $H + H_2 \rightarrow H_2 + H$ and $D + H_2 \rightarrow HD + H$ reactions in the high energy region (up to 1.2 eV translational energy) relevant to resonance structures reported in recent experiments. 35 refs., 11 figs.

3078 (LBL–27938) **Theoretical methods for the study of chemical dynamics.** Makri, N. Lawrence Berkeley Lab., CA (USA). Apr 1989. 189p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90003122. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

Theoretical methods are developed for studying the dynamics of chemical reactions. Many chemical processes can be adequately described as a "system" of one or two reaction coordinates coupled to a "bath" of harmonic oscillators. Such a formulation of the problem has obvious advantages as it is often possible to integrate out the harmonic bath, thus reducing the many degree of freedom problem to a one or two dimensional calculation. A simple semiclassical model for incorporating tunneling effects in classical trajectory simulations is constructed and shown to give excellent results over a variety of conditions. Feynman path integration provides an exact way of calculating quantum, dynamical properties and is in principle applicable to problems of involving many degrees of freedom. However, the standard Monte Carlo methodology which must be used to evaluate the multidimensional integrals that occur, is not directly applicable to the path integral expression for the real time propagator, because the integrand of the latter is highly, oscillatory. A technique which helps circumvent this problem by sampling about the stationary phase points of the integrand is developed and illustrated with several numerical applications. A new effective real time propagator is also constructed, which is localized and devoid of rapid oscillations. Finally, accurate approximations to the short time propagator

are derived, which drastically improve the convergence characteristics of path integrals. These techniques are expected to extend the applicability of path integral calculations to more complex chemical problems. 258 refs., 63 figs., 3 tabs.

3079 (LBL–27940) **Some new theoretical methods for treating reaction dynamics in polyatomic molecular systems.** Miller, W.H.; Chang, Yan-Tyng; Makri, N. Lawrence Berkeley Lab., CA (USA). Jul 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8907165–1: NATO advanced study institute meeting, Istanbul (Turkey), 30 Jul - 12 aug 1989). Order Number DE90003115. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Many useful descriptions of dynamical processes in polyatomic molecular systems are based on a reaction path approach. I.e., the potential energy surface is approximated as a multidimensional harmonic valley about a (curved) line in the 3N-6 dimensional space of the N atom system along which the motion is thought to be most localized. These lectures briefly review this reaction path methodology, but then focus mainly on some more recent approaches that go beyond the reaction path point of view. In particular, it is shown how empirical potential functions can be combined with selected ab initio calculations within an empirical valence bond model in order to construct a global potential energy surface for polyatomic reactions. Two other topics that are discussed are a new way of handling zero point energy in a classical trajectory simulation of polyatomic dynamics and a new model for including tunneling effects in a trajectory simulation. 30 refs., 1 fig.

3080 (PPA-T–85) **Synthesis of acrylated urethane oligomer.** Mohamad Hilmi bin Mahmood; Hussin bin Mohd Nor; Dahlan bin Haji Mohd. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). Nov 1988. 8p. Order Number DE90607903. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Acrylated urethane oligomer was synthesized using poly (propylene) diol MW 1000, toluene diisocyanate (TD1) and 2-hydroxyethyl acrylate (HEA) at 50-90^{0}C. (author).

3081 (SAND–89-0691) **ANEOS [analytic equation of state package] models for shock compression of saturated limestone: Applications to ground shock calculations.** Brown, W.T. Sandia National Labs., Albuquerque, NM (USA). Oct 1989. 69p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. Order Number DE90002359. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Simple mixture rules are used to calculate input parameters for an analytic equation of state package (ANEOS) to model saturated limestone as a homogeneous material. This method is used to determine changes in material parameters as the volume fraction of water in the rock changes. Hugoniots determined from these are compared with experimental and theoretical Hugoniots for saturated limestone samples with various porosity levels. Ground shock calculations are also performed to model a deeply buried 500 kiloton explosion in saturated limestone containing various amounts of water. 37 refs., 29 figs.

3082 **A single turnover (STO) characterization of supported palladium catalysts.** Augustine, R.L. (Dept. of Chemistry, Seton Hall Univ., South Orange, NJ (US)); Baum, D.R. vp of Microstructure and properties of catalysts. Treach, M.M.J.; Thomas, J.M.; White, J.M. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711205–: Symposium on microstructure and properties of catalysts, Boston, MA (USA), 30 Nov - 3 dec 1987).

The STO catalyst characterization procedure has been applied to a variety of supported Pt catalysts. This paper describes an application of this technique to the characterization of supported Pd catalysts which showed that there were several significant differences between the Pt and the Pd catalysts. Under STO reaction conditions each surface site on a Pt catalysts reacts only once so there is a 1:1 relationship between the product composition and the densities of the various types of active sites present. With Pd catalysts under these same conditions, alkene isomerization takes place so readily that the amount of isomerized product formed depends on the contact time of the reactant pulse with the catalyst so there is no direct relationship between the amount of isomerization and the number of isomerization sites present.

3083 **Analysis of a diffusion-limited island growth mechanism for chemisorption and epitaxy.** Evans, J.W. (Ames Laboratory and Department of Physics, Iowa State University, Ames, Iowa 50011 (US)). *Physical Review [Section] A: General Physics (USA)*, 40(5): 2868-2870 (1 Sep 1989). DOE Contract W-7405-ENG-82.

We consider an island growth mechanism wherein species adsorbed on top of two-dimensional islands diffuse to the edge and are then incorporated. A simple matrix formulation is developed for this random-walk problem which allows exact calculation of the growth probability distribution, neglecting island rearrangement. Furthermore, we also show how related trapping probabilities can be calculated recursively for various stages of island growth. The case of imperfect trapping at island edges is also considered, and reduction to Eden-model–type growth in the low-trapping-probability regime is demonstrated. In general, the growing islands are rounder and have fewer defects and narrower active zones than Eden clusters.

3084 **High resolution spectroscopic detection of acetylene–vinylidene isomerization by spectral cross correlation.** Chen, Y. (Department of Chemistry and George R. Harrison Spectroscopy Laboratory, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139 (US)); Jonas, D.M.; Kinsey, J.L.; Field, R.W. *Journal of Chemical Physics (USA)*, 91(7): 3976-3987 (1 Oct 1989).

Information about the unimolecular acetylene (HC 3/4 CH)↔vinylidene (H_2C=C:) isomerization on the S_0 energy surface has been extracted from vibrationally unassigned high resolution stimulated emission pumping (SEP) spectra of acetylene. The combination of a new pattern recognition scheme, spectral cross correlation (SCC) with complete nuclear permutation-inversion (CNPI) group theory is shown to be a powerful new technique for characterizing bond rearrangement in highly vibrationally excited normally rigid polyatomic molecules. SCC detects isomerization "resonances" which destroy an approximate vibrational symmetry (e.g., the number of *cis*-bending quanta). The energies (relative to the zero point level of the stablest isomer) and widths of such resonances provide information about the "energies" of isomer rovibrational levels and the isomer-level-specific isomerization rate. Vinylidene isomerization resonances may be distinguished from ordinary acetylene Fermi or Coriolis perturbations by a unique rotational symmetry dependence due to the correlation between acetylene [$D_{\infty h}$(M)] and vinylidene [C_{2v}(M)] levels in the CNPI group G_8. An SCC map of the HCCH S_0 15 000–15 900 cm^{-1} energy region above the zero point level was obtained by comparing SEP spectra recorded via $S_1(\tilde{A}\ ^1A_u)3^3$ and 2^16^2 K_a=1 intermediate levels. The predicted rotational symmetry dependence of the SCC was found between 15 410–15 640 cm^{-1}, but the vinylidene resonance line shape was obscured by Franck–Condon interference effects from well known perturbations between the 3^3 and 2^16^2 SEP intermediate levels.

3085 **Bimodal kinetic energy release in the unimolecular dissociation of energy-selected formic acid ion.** Nishimura, T. (Department of Chemistry, University of Nebraska-Lincoln, Lincoln, Nebraska 68588-0304 (US)); Meisels, G.G.; Niwa, Y. *Journal of Chemical Physics (USA)*, 91(7): 4009-4018 (1 Oct 1989).

Dissociation of HCOOH$^+$ and DCOOH$^+$ have been studied using threshold photoelectron–photoion coincidence (TPEPICO) mass spectrometry. The detailed breakdown diagrams were obtained over internal energies of the molecular ion less than 8 eV. Kinetic energy release distributions (KERDs) for HCO$^+$ and DCO$^+$ were extracted from their flight time distributions by using a multiple linear regression method. The breakdown curve of HCO$^+$ not only exhibited several maxima but also the surprisal analysis of its KERD demonstrated a considerable deviation from a single statistical distribution. Bimodal KERDs were observed for the formation of HCO$^+$ and DCO$^+$. The large KER component results from dissociation to the products in the ground state, HCO$^+$ ($^1\Sigma^+$)+·OH ($^2\Pi_i$). Average kinetic energy releases observed for this process are, however, about twice higher than those calculated by QET/RRKM. The small KER component shows average KERs remarkably smaller than the statistical expectations and this value remains constant over the energy range of 4.5 eV. The origin of this small KER component was ascribed to dissociation after fluorescent transition of initial vibronic

states to the first excited state (1 $^2A''$). In contrast with these results average KERs measured for H_2O^+ and HDO^+ are in good agreement with the RRKM/QET calculations.

3086 A semiclassical tunneling model for use in classical trajectory simulations. Makri, N. (Department of Chemistry, University of California, and Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Miller, W.H. *Journal of Chemical Physics (USA),* 91(7): 4026-4036 (1 Oct 1989). DOE Contract AC03-76SF00098.

A semiclassical model for tunneling from one classically allowed region on a potential energy surface to another is described. The principal feature of this model, compared to earlier (more "rigorous") multidimensional semiclassical tunneling theories, is that it can be implemented in a straightforward way within the framework of a standard classical trajectory simulation. Applications to several examples of unimolecular isomerization and unimolecular dissociation show that the model is capable of providing excellent results over a wide range of conditions (i.e., coupling strengths, different symmetries of couplings, etc.)

3087 Evaluation of the rate constant for the reaction $OH+H_2CO$: Application of modeling and sensitivity analysis techniques for determination of the product branching ratio. Yetter, R.A. (Department of Mechanical and Aerospace Engineering and Department of Chemistry, Princeton University, Princeton, New Jersey 08544 (US)); Rabitz, H.; Dryer, F.L.; Maki, R.G.; Klemm, R.B. *Journal of Chemical Physics (USA),* 91(7): 4088-4097 (1 Oct 1989). DOE Contract AC02-76CH00016.

Novel modeling and sensitivity analysis techniques are used with experimental data obtained from discharge flow–resonance fluorescence experiments to evaluate the product branching ratio of $OH+H_2CO$. Two channels are considered: the H-atom abstraction reaction (R2) to form HCO and H_2O; and the addition reaction (R17) followed by rearrangement and decomposition to form HCOOH and H. The rate constant values obtained at 298 K are $k_{R2}=(7.75\pm1.24)\times10^{-12}$ cm^3/molecule s and $k_{R17}=(0.2^{+0.8}_{-0.2})\times10^{-12}$ cm^3/molecule s. The results demonstrate that the reaction proceeds almost exclusively via the H-atom abstraction pathway.

3088 X-ray diffraction study of liquid *n*-butane at 140 and 267 K. Habenschuss, A. (Chemistry Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831 (US)); Narten, A.H. *Journal of Chemical Physics (USA),* 91(7): 4299-4306 (1 Oct 1989). DOE Contract AC05-84OR21400;AC05-76OR00033.

X-ray diffraction data for liquid *n*-butane near the triple and boiling points are presented. The data are analyzed using scattering factors for $-CH_3$ and $-CH_2$ groups which permits extraction of structure and distribution functions for carbon sites. An intramolecular carbon–carbon distance at approximately 3.1 A is assigned to a short end-to-end distance in a near-*gauche* conformation, which is in agreement with the electron diffraction results for gaseous *n*-butane. The intermolecular pair distribution functions show a large difference in the liquid structure for the low and high temperature states, similar to that found in liquid propane.

3089 Molecular dynamics for discontinuous potential. IV. Lennard-Jonesium. Chapela, G.A. (Department of Chemical Engineering and Materials Science, University of Minnesota, 151 Amundson Hall, 421 Washington Avenue S.E., Minneapolis, Minnesota 55455 (US)); Scriven, L.E.; Davis, H.T. *Journal of Chemical Physics (USA),* 91(7): 4307-4313 (1 Oct 1989).

Argon, represented as a Lennard-Jones fluid, is simulated using a discontinuous version of the potential. The effect of discretization is thoroughly investigated in terms of the number of discontinuities and the cutoff diameter. Radial distribution functions, pressure, energy, self-diffusion coefficients, and velocity autocorrelation functions are used in order to evaluate this effect. A reduction of five times on computing time can be achieved by varying the cutoff radius and the number of discontinuities without much departure from the physical representation of Lennard-Jonesium atoms. The results indicate that discontinuous molecular dynamics is a viable alternative method to Monte Carlo and continuous molecular dynamics in simulating the properties of simple fluids.

3090 The bonding of acetonitrile and CH_2CN on Ag(110) determined by near edge x-ray absorption fine structure: Evidence for π-donor bonding and azimuthal ordering. Stevens, P.A. (Department of Applied Physics, Stanford University, Stanford, California 94305 (US)); Madix, R.J.; Stohr, J. *Journal of Chemical Physics (USA),* 91(7): 4338-4345 (1 Oct 1989).

Carbon *K* edge near edge x-ray absorption fine structure (NEXAFS) spectra of adsorbed acetonitrile and reactive intermediates derived therefrom on Ag(110) were studied in order to determine their orientation and bonding to the surface. For both the multilayer and the adsorbed monolayer there is excellent agreement between the spectra of the adsorbed acetonitrile and the gas phase species. For the multilayer coverage the orientation of the acetonitrile molecules is not completely random; the molecules prefer an orientation with their bond axes closer to parallel than perpendicular to the surface. At monolayer coverage acetonitrile bound to the surface is unrehybridized. It is bound with its linear molecular skeleton parallel to the surface and randomly oriented azimuthally. Annealing molecular CH_3 CN to 325 K in the presence of coadsorbed atomic oxygen produces a linear CH_2 CN surface intermediate, the molecular axis of which is parallel to the surface and perpendicular to the close-packed direction. The C–C and C–N bond lengths are essentially unperturbed from their values in gas phase CH_3 CN. Bonding appears to occur between the methylene carbon and the metal, as expected. A broadening of the π^* resonance for transition into the π^* orbital perpendicular to the surface is interpreted in terms of π-donor bonding.

3091 The reactions of iron clusters with water. Weiller, B.H. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Bechthold, P.S.; Parks, E.K.; Pobo, L.G.; Riley, S.J. *Journal of Chemical Physics (USA),* 91(8): 4714-4727 (15 Oct 1989). DOE Contract W-31-109-ENG-38.

The reactions of neutral iron clusters Fe_{7--27} with water are studied in a laser-vaporization cluster source coupled to a continuous-flow reactor. Reaction products are detected via laser ionization and time-of-flight mass spectrometry. The reactions of room-temperature clusters with H_2O show adsorbate decomposition and hydrogen desorption, as do the reactions with D_2O at elevated temperatures. The room-temperature reaction with D_2O appears not to involve any decomposition, and is at equilibrium under the conditions of these experiments. The dependence of reaction extent on D_2O pressure yields equilibrium constants for the addition of the first and second D_2O molecules. The analysis is complicated by the presence of two-photon ionization processes that are treated quantitatively with a rate-equation model. This treatment also yields estimates for cluster photoabsorption cross sections, which are found to be approximately linear in cluster size, having a magnitude of 2.3×10^{-17} cm^2 per iron atom. From the derived equilibrium constants and estimated adsorption entropies, approximate D_2O–cluster binding energies are determined. They range from 0.42 to 0.59 eV, and their dependence on cluster size shows a remarkable similarity to the dependence of the rate constants for reaction of iron clusters with H_2. The implications of this similarity are discussed.

3092 Dissociation energy of the molecule AlBr from equilibrium measurements. Hildenbrand, D.L. (SRI International, Menlo Park, California 94025 (US)); Lau, K.H. *Journal of Chemical Physics (USA),* 91(8): 4909-4911 (15 Oct 1989).

The dissociation equilibrium AlBr=Al+Br was studied by effusion beam mass spectrometry over the range 1970 to 2260 K and the dissociation energy D^0_0(AlBr) was derived as 4.41 ± 0.06 eV. This value is in general agreement with other fragmentary thermochemical results, but it is lower than a value derived from a short extrapolation of vibrational levels in the excited $^1\pi$ state, doubtless because of a potential maximum of about 0.22 eV in that state. A Birge–Sponer extrapolation of the ground state vibrational levels, when corrected for degree of ionicity, yields a D^0_0 value in close accord with the experimental result, but an electrostatic model calculation falls short by 0.45 eV.

3093 Self-diffusion on the Lennard-Jones fcc(111) surface: Effects of temperature on dynamical corrections. Cohen, J.M. (Theoretical Division (T-12, MS J569), Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)); Voter, A.F. *Journal of Chemical Physics (USA),* 91(8): 5082-5086 (15 Oct 1989).

Surface self-diffusion constants have been calculated for the single component Lennard-Jones fcc(111) system using the dynamical corrections formalism for transition state theory (TST). At high temperatures, these results are found to be in agreement with previous molecular dynamics calculations. Over the extended temperature range in which this method is valid, deviations from Arrhenius behavior are observed. At lower temperatures, a noticeable contribution to the diffusion constant stems from trajectories in which the adatom recrosses the TST boundary, often due to a direction-reversing collision with the substrate atom on the far side of the binding site. This produces a dip in the dynamical correction factor centered around a reduced temperature of T=0.038. At higher temperatures, the expected multiple-jump effects are observed.

3094 **The influence of adsorbate–absorbate hydrogen bonding in molecular chemisorption: NH_3, HF, and H_2O on Au(111).** Kay, B.D. (Sandia National Laboratories, Albuquerque, New Mexico 87175 (US)); Lykke, K.R.; Creighton, J.R.; Ward, S.J. *Journal of Chemical Physics (USA),* 91(8): 5120-5121 (15 Oct 1989). DOE Contract AC04-76DP00789.

Molecular beam and temperature programmed desorption (TPD) techniques are used to study the low temperature (85 K) adsorption and subsequent thermal desorption of NH_3, HF, and H_2O from Au(111). At 85 K the molecular sticking coefficients are near unity and are coverage independent. The TPD spectra are qualitatively different for the various species. Simple hydrogen bonding arguments based on absorbate–absorbate interactions are used to explain the differences in the TPD spectra.

3095 (DOE/ER/13695–T1) **Laser photoelectron spectroscopy of ions: Progress report, 1988–1989.** Ellison, G.B. Colorado Univ., Boulder, CO (USA). Dept. of Chemistry and Biochemistry. Oct 1989. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13695. Order Number DE90002873. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We use photoelectron spectroscopy to study the properties of negative ions and radicals. The essence of our experiment is to cross a 0.6 keV mass-selected ion beam (M^-) with the output of a CW laser $\hbar\omega_0$. The resultant detached photoelectrons with kinetic energy, KE, are energy analyzed by means of a set of electrostatic hemispherical analyzers. Analysis of the photoelectron spectra enables us to extract molecular electron affinities, vibrational frequencies and electronic splittings of the final radical, M, as well as the relative molecular geometries of ions (M^-) and radicals (M). During the last three years we have completed the several studies: borane, amide, oxygen and nitric oxide, and ethylene and acetylene. We have also nearly completed a major overhaul of our photoelectron spectrometer that will permit us to prepare collisionally relaxed ions in a flowing afterglow ion source. 21 refs., 4 figs.

3096 (LBL–26906) **Photofragmentation of ketene to $CH_2(\tilde{X}^3B_1)$ + CO: Dissociation rate, energy release and exit barrier height.** Chen, I-Chia. Lawrence Berkeley Lab., CA (USA). Feb 1989. 116p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90002463. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Ketene cooled in a supersonic free jet is photolyzed in the ultraviolet range. The appearance rate of fragment CO from triplet ketene as a function of ultraviolet photon energy is measured by vacuum ultraviolet laser-induced fluorescence. A tunneling-corrected RRKM theory is used to fit the observed dissociation rate of ketene using the ab initio vibrational frequencies of the transition state. The rotational state distributions of CO from ketene photolyzed at 1120, 190, and 30 cm^{-1} above and at 50 cm^{-1} below the top of the barrier to dissociation on the triplet surface are measured. 25 refs., 17 figs., 9 tabs.

3097 **Ar^+_3 photodissociation and its mechanisms.** Chen, Z.Y. (Department of Chemistry, The Pennsylvania State University, University Park, Pennsylvania 16802 (US)); Albertoni, C.R.; Hasegawa, M.; Kuhn, R.; Castleman, A.W. Jr. *Journal of Chemical Physics (USA),* 91(7): 4019-4025 (1 Oct 1989).

The photodissociation spectrum of Ar^+_3 between 520 and 620 nm is reported. A broadband peaking near 520 nm is observed with a cross section of $\sim 1.8\times10^{-16}$ cm^2 at the peak, in agreement with the findings of Levinger *et al.* [J. Chem. Phys. **89**, 71 (1988)]. However, in the present work, a shoulder whose prominence is highly temperature dependent is observed between 545 and 555 nm. The new results are discussed in terms of various electronic transitions and pathways to dissociation. The photodissociation mechanisms are studied by translational energy analysis of photofragmentation. Three photodissociation mechanisms that involve two electronic energy surfaces are proposed which account for the experimental findings.

3098 **Dissociation of cyclohexene and 1,4-cyclohexadiene in a molecular beam.** Zhao, X. (Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory and Department of Chemistry, University of California, Berkeley, California 94720 (US)); Continetti, R.E.; Yokoyama, A.; Hintsa, E.J.; Lee, Y.T. *Journal of Chemical Physics (USA),* 91(7): 4118-4127 (1 Oct 1989). DOE Contract AC03-76SF00098.

Molecular-beam photofragmentation translational spectroscopy of cyclohexene and 1,4-cyclohexadiene was carried out using 193 nm and IR multiphoton excitation. At 193 nm, both the retro-Diels–Alder reaction of cyclohexene and H_2 elimination from both molecules were observed in the ground electronic state, indicating the occurrence of internal conversion from the initially excited electronic states. The retro-Diels–Alder reaction is shown to be concerted up to an internal energy higher than 148 kcal/mol. Hydrogen-atom elimination was also observed for both molecules following 193 nm excitation. The H atom is eliminated from an excited state of cyclohexene and is assigned to be from a carbon adjacent to the double bond, with a corresponding C–H bond energy of 87±3 kcal/mol. It is shown that the peak of the translational energy distribution for concerted dissociation in the ground state is determined mainly by the dynamics of the potential-energy release along the reaction coordinate, and is not sensitive to either the amount of internal energy or the form of excitation.

3099 **Two-dimensional spectroscopy: Theory of nonstationary, time-dependent absorption and its application to femtosecond processes.** Fain, B. (Department of Chemistry and Center for the Study of Early Events in Photosynthesis, Arizona State University, Tempe, Arizona 85287-1604 (US)); Lin, S.H.; Hamer, N. *Journal of Chemical Physics (USA),* 91(8): 4485-4494 (15 Oct 1989).

In this paper, we present a formalism for a generalized linear susceptibility applicable to femtosecond (fs) processes. As an application, we analyze the recent experimental results of the real-time fs transition spectra of the photodissociation of NaI and NaBr reported by Zewail *et al.* In this connection we also investigate in general the behaviors of decaying and trapping of the molecule in an excited electronic state coupled to a continuum.

3100 **A three-dimensional L^2 simulation of the photodetachment spectra of $ClHCl^-$ and IHI^-.** Gazdy, B. (Department of Chemistry, Emory University, Atlanta, Georgia 30322 (US)); Bowman, J.M. *Journal of Chemical Physics (USA),* 91(8): 4615-4624 (15 Oct 1989).

We report three-dimensional L^2 basis-set calculations of eigenvalues and eigenfunctions of ClHCl and IHI for zero total angular momentum. Comparisons are made to previous calculations of resonance energies and the bound state in IHI. These eigenfunctions are used in simulations of the photodetachment spectra of $ClHCl^- \rightarrow ClHCl + e^-$ and $IHI^- \rightarrow IHI + e^-$. The spectra are convoluted with Gaussian weight functions as was done in very recent simulations of Schatz, based on coupled-channel scattering calculations, and in the experiments of Neumark and co-workers.

3101 Ionization yields in hydrocarbons under electron irradiation. Tung, C.J. (Brookhaven National Lab., Upton, NY (USA)); Baum, J.W. *Radiation Research (USA)*, 119(3): 413-423 (Sep 1989).

Ionization yields and W-values in several hydrocarbon gases under electron irradiation have been calculated using Inokuti's solution of the Fowler equation, i.e., incorporating a linear dependence of ionization yield on source electron energy. Collision stopping powers of hydrocarbons were evaluated using the Bethe formula with mean excitation energies determined using the additivity rule with modification based on molecular bond strengths. Contributions to the collision stopping powers from discrete level excitations were estimated by multiplying collision stopping powers by the excitation fractions constructed from atomic calculations. Average energy transfers for ionizing collisions producing subionization electrons were calculated using differential ionization cross sections proposed by Khare and co-workers. The calculated W-values are in good agreement with those recommended by ICRU.

3105 Target and method for the production of fission product molybdenum-99. Vandergrift, G.F.; Vissers, D.R.; Marshall, S.L.; Varma, R. To Dept. of Energy, Washington, DC. USA Patent 4,839,133. 13 Jun 1989. Filed date 26 Oct 1987. USA Patent Application 7,112,158. 8p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a target for the reduction of fission product Mo-99. It is prepared from uranium of low U-235 enrichment by coating a structural support member with a preparatory coating of a substantially oxide-free substrate metal. Uranium metal is electrodeposited from a molten halide electrolytic bath onto a substrate metal. The electrode-position is performed at a predetermined direct current rate or by using pulsed plating techniques which permit relaxation of accumulated uranium ion concentrations within the melt. Layers of as much as to 600 mg/cm^2 of uranium can be prepared to provide a sufficient density to produce acceptable concentrations of fission product Mo-99.

Pub. in SIAM Jnl. of Applied Mathematics, Vol. 49, No. 2, 432-458(Apr 1989).

Experimental observations of ignition in explosive systems demonstrate that, as a rule, combustion first sets in at small, discrete sites where inherent inhomogeneities cause chemical activity to proceed preferentially and lead to localized explosions. Combustion waves propagating away from these 'reaction centers' eventually envelop the remaining bulk. This study examines the spatial structure and temporal evolution of a reaction center for a model involving Arrhenius kinetics. The center, characterized by peaks in pressure and temperature with little diminution in local density, is shown to have one of two possible self-similar structures. The analysis employs a combination of asymptotics and numerics, and terminates when pressure and temperature in the reaction center have peaked.

3107 (DOE/ER/13471–T2) **Kinetics data base for combustion modeling: Status report, February 1, 1988–January 31, 1989.** Herron, J.T.; Tsang, W. National Bureau of Standards, Washington, DC (USA). Chemical Kinetics Div. 8 Jul 1988. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AI01-86ER13471. Order Number DE90003095. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Work carried out at the National Bureau of Standards for the Basic Energy Sciences Division of the Department of Energy under Interagency Agreement A101-76PRO6016, Task Order No. 007, Amendment No. 5, "Kinetic Data Base for Combustion Modeling" is summarized. By the end of the present contract year, recommended values will be provided for the elementary chemical reactions of trans-2-butene and the allyl radical with the species in the existing data base. The total number of elementary interactions which will be evaluated will exceed 1020. The data compilation part of the program is essentially current and the total number of reactions covered now exceeds 2500. 5 refs.

3108 (LBL–27904) **A tomographic study of premixed turbulent stagnation point flames.** Shepherd, I.G.; Cheng, R.K.; Goix, P. Lawrence Berkeley Lab., CA (USA). Oct 1989. 11p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. F-44620-76-C-0083. (CONF-8910289–2: Western States Section meeting of the Combustion Institute, Livermore, CA (USA), 23-24 Oct 1989). Order Number DE90002462. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The high speed tomographic technique has been used to study premixed flame propagation in stagnation flow stabilized flames. Studies are performed on CH4/Air and C2H4/Air flames with equivalence ratios ranging from 0.75 to 1.0. The gas velocity at the nozzle exit is 5 m/s, the turbulence intensity is varied from 5% to 7% and the turbulence Reynolds number is 70. The light source is a copper vapor laser which produces 20ns, 5 mJ pulses at a 4KHz repetition rate. Cylindrical lenses transform the 38 mm circular laser beam to a sheet 50 mm high and 0.6 mm thick. A high speed Fastax camera is used to record the tomographic images. The films are digitized and the flame front extracted from the images by a threshholding technique. A fractal analysis was performed on the flame boundaries in order to characterize the flame geometry and provide an estimate of the flame surface area. The flame area increase was found to give a reasonable estimate of the burning rate when compared with other methods if the effects of flow tube divergence were considered. Characteristic wrinkle sizes were found to be much larger than the length scales of the turbulence in the reactant stream. 8 refs., 5 figs., 2 tabs.

3109 (LBL–27916) **Molecular beam studies of oxygen atom reactions with unsaturated hydrocarbons.** Schmoltner, A.-M. Lawrence Berkeley Lab., CA (USA). Oct 1989. 295p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90003124. Available from NTIS, PC A14/MF A01 - OSTI; GPO Dep.

The dynamics of several elementary reactions relevant to combustion was investigated. The reactive scattering of ground state oxygen atoms with small unsaturated hydrocarbons was studied using a crossed molecular beam apparatus with a rotatable mass spectrometer detector. The infrared and ultraviolet photodissociation of anisole was studied using a rotating beam source/fixed detector apparatus. 253 refs., 64 figs., 4 tabs.

3110 (NEI-DK–215) **Development of a data-processing model for steady turbulent 3-D gas particle flow.** Energiministeriets Energiforskningsprogram. Braendsler og forbraendingsteknik. Olsen, A.; Astrup, P.; Dall, H.; Gjernes, E.; Hadvig, S.; Toerslev Jensen, P.; Kampp Rasmussen, N.B. Risoe National Lab., Roskilde (Denmark); Danmarks Tekniske Hoejskole, Lyngby (Denmark). Energiministeriets Energiforskningsprogram. Braendsler og forbraendingsteknik.; EFP-85. Consist of 8 papers.

The project "Development of a data processing model for steady turbulent 3-D gas-particle flow" was carried out in collaboration with the Laboratory for Heating and Indoor Climate Technology at the Technical University of Denmark and the Heating Technology Section of the Energy Technology Department at Risoe National Laboratory. The basis for the project is described, as are methods used and the results achieved. The seven partial reports are included in their unmitigated versions. Transport of gas mixed with particles is inevitable in many industrial processes particularly where pulverized coal is used as fuel. The particles can cause damage to components, such as erosion on turbine blades etc., and their contribution to the extent of air pollution is significant. It is important to be able to measure and predict the extent of gas-particle flow in boilers, and the aim of this project was to develope computerized simulations and computer programs in order to achieve this goal. (AB).

Energiministeriets Energiforskningsprogram. Braendsler og forbraendingsteknik.; EFP-85. Consists of 8 papers.

A method for calculating thermal radiation using a quite new concept, the NIMREX model, is presented. The governing differential equations of thermal radiation are integrated by a method of numerical integration known from finite element methods. Theoretically the model is exact and can be brought to an arbitrary level of accuracy for an optical thickness from zero to infinity. For test purpose a FORTRAN code has been constructed. Based on a 1% accuracy level the NIMREX model is faster than a Monte Carlo zone (MCZ) method, except for the optically thin case. The two methods agree except in the optically thick case where the NIMREX model agrees with exact solutions of the diffusion method, while the MCZ method disagrees. (author).

3114 (PB–89-231617/XAB) **Enhanced flame stability and soot radiation using electric fields. Final report, July 1986-January 1989.** Berman, C.H.; Gill, R.J.; Calcote, H.F. AeroChem Research Labs., Princeton, NJ (USA). Jun 1989. 15p. (AEROCHEM-TP–484). Available from NTIS, PC A03/MF A01.

See also PB–89-140883.

Enhanced stabilization of methane-air flames was achieved by application of dc electric fields of only a few thousand volts with a minimum electric power dissipation, about 0.01% of the combustion power being controlled. Both the lean-blowoff composition and the maximum blowoff velocity are markedly affected. The mechanism for the phenomenon is discussed in terms of an effect of the electric field on the boundary velocity gradient. The electric field applies an electric force on the chemiions in the flame, producing an electric wind that forces the flame closer to the burner rim both reducing the dead space and decreasing the boundary velocity gradient. The boiling effect on a flat flame due to the application of an electric field, reported previously, is explained by an electron cascade effect in which thermally produced electrons are accelerated by the electric field producing more charged soot particles. In a counterflow flame, periodic waves are produced by the electric field; an explanation has not been developed. The counterflow and flat flame apparatus, including the laser optical system for particle measurements in the flame has been completely redesigned for more rapid and especially more accurate data collection.

3115 (VTT-TUTK–622) **Combustion of fixed-bed in grate firing.** Koistinen, R. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Jun 1989. 106p. (In Finnish). Order Number DE90719334. Available from NTIS (US Sales Only), PC A06/MF A01.

This study considers the basic phenomena that characterize fixed-bed combustion. The experimental and theoretical results reported and compared here deal with grate boilers in particular. The study begins with considerations of single fuel particles, and proceeds then to different kinds of fixed-bed firing in both laboratory and full scale conditions. As a whole, the nature of these considerations is very practical. The burning rate of peat and wood fuels with high moisture content is primarily limited by speed of fuel drying and pyrolysis (flame spread rate). The radiation heat transfer is of very great importance in cases where the bed is thin and the furnace surfaces as a whole are refractory-lined. Preheating of combustion air has a considerable impact on combustion, if the air temperature is sufficiently high (200-300 deg C) and if the mass flow of air is big enough. In grate-furnaces (crossfeed type) firing wood and peat the burning rate varies between 0.3-1.0 MW/m^2 depending on the moisture content of fuel. An increase of the width-to-length ratio of the grate promotes burning rate per unit area. In pure overfeed combustion the burning rate per unit grate area can reach 1.4-1.6 MW/m^2. The overfeed structure is less expensive than the crossfeed one. In the overfeed principle high burning rates can be reached with relatively small primary air flow. The burning rate is restricted only by velocity and mass flow of primary air. In the overfeed firing the high temperature in the coke layer is a problem and ash can easily melt on the grate.

3116 Laser-induced-fluorescence spectroscopy of jet-cooled C_3. Rohlfing, E.A. (Combustion Research Facility, Sandia National Laboratories, Livermore, California 94551 (US)). *Journal of Chemical Physics (USA)*, 91(8): 4531-4542 (15 Oct 1989).

We present a spectroscopic study of jet-cooled C_3 in which laser-induced-fluorescence (LIF) excitation spectra and dispersed-fluorescence (DF) spectra are taken for a new, vibronically induced band system ($^1\Pi_g$ and/or $^1\Delta_u$)–$\tilde{X}\ ^1\Sigma^+_g$ in the ultraviolet. In addition, DF spectra are taken for the well-known cometary band system, $\tilde{A}\ ^1\Pi_u$–$\tilde{X}^1\Sigma^+_g$. The DF spectra of the new system are very rich and display strong fluorescence bands in stretch–bend progressions that reach as high as 17 000 cm^{-1} in the $^1\Sigma^+_g$ ground state. The data from the DF spectra of both systems is used to assign vibrational term energies to 144 ground-state levels that cover the range: $0 \leq v_1 \leq 8$, $0 \leq v_2 \leq 37$, and $0 \leq v_3 \leq 4$. The observed level structure clearly demonstrates the highly anharmonic nature of the potential energy surface of C_3 and the unusual internal dynamics that occurs upon it. These include pronounced barriers to linearity in the v_3=2 and v_3=4 states and an increase in molecular rigidity as the symmetric stretch is excited.

3117 (AD-A–210345/5/XAB) **Composite ceramic superconducting wires for electric-motor applications. Annual report No. 1, 30 June 1988-30 June 1989.** Holloran, J.W. Casazza, Schultz and Associates, Inc., Arlington, VA (USA). 7 Jul 1989. 189p. (CPS–89-009). Available from NTIS, PC A09/MF A01.

This report describes progress on developing Y-123 wire for an HTSC motor. The wire development involves synthesis of Y-123 powder, spinning polymer-containing green fiber, heat treating the fiber to produce metallized superconducting filaments, and characterizing the electrical properties. A melt spinning process was developed for producing 125-micron-diameter green fiber containing 50 vol% Y-123. This fiber can be braided for producing transposed multifilamentary wire. A process was developed to coat green fiber with silver alloys which can be continuous sintering. A second process for multifilamentary ribbon wire is also being developed. The Y-123 filaments have 77 deg self-field Jc values up to 2600 A/sq cm, but Jc is reduced to 10 A/sq cm at 800 G. Preliminary data are presented on mechanical properties. A DC homopolar motor with an iron magnetic circuit is being designed to operate with early HTSC wire.

3118 (AD-A–210726/6/XAB) **Frequency dependence of quasi-particle mixers.** Danchi, W.C.; Sutton, E.C. California Univ., Berkeley, CA (USA). 1 Dec 1986. 12p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Applied Physics, Vol. 60, No. 11, 3967-3977(1 Dec 1986).

Since the publication of the original theoretical work on superconductor-insulator-superconductor (SIS) tunnel-junction quasi-particle mixers by Tucker, theoretical attention has largely focused on understanding the physical origin of gain (conversion efficiency greater than unity) in the mixer, the conditions for mixer saturation and the behavior of series arrays of junctions. This work is applicable to frequencies generally much less than the frequency corresponding to the superconducting energy gap. The analysis reported here primarily differs from previous work in that analytic approximations to the quantum mixer theory of Tucker are developed that allow one to derive simple power-law expressions for mixer conversion efficiency and noise temperature due to shot noise over the complete frequency range. These approximations allow one to have a qualitative understanding of frequency-dependent effects in quasi-particle mixers.

3119 (AD-A–210860/3/XAB) **Inverse a-c Josephson effect at terahertz frequencies.** Danchi, W.C.; Golightly, W.J.; Sutton, E.C. California Univ., Berkeley, CA (USA). 1 Apr 1989. 16p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Applied Physics, Vol. 65, No. 7, 2772-2786(1 Apr 1989).

The inverse a-c Josephson effect occurs when a Josephson junction driven by a microwave source of frequency f produces constant-voltage steps at integer multiples of hf/2e. For low leakage current, hysteretic junctions driven at microwave frequencies below about 100 GHz, some of these steps can cross the zero dc bias current axis. These zero-crossing steps allow modern-series array-voltage standards to operate without individually biasing the junctions in the array. The authors r-eexamine the theory behind these steps and show that they can exist at frequencies much higher than thought previously; the Riedel singularity in the supercurrent response allows this effect to exist even up to terahertz frequencies. They describe a set of analytical calculations that provide limits on the amount of rounding of the Riedel Peak that can be permitted while still allowing these zero-crossing steps to occur. They also discuss practical considerations such as microwave power levels required and parameters for device fabrication. This analysis is supported by numerical frequency-domain computations and time-domain simulations for a number of realistic I-V curves with rounded Riedel singularities and with quasi-particle subgap leakage currents.

3120 (AD-A–210988/2/XAB) **Effect of twins on critical currents of high T_c superconductors. Interim report No 4.** Campbell, A.M.; Ashby, M.F. Cambridge Univ. (UK). 1989. 4p. Available from NTIS, PC A02/MF A01.

The initial work on levitation forces and separation of superconducting powders has divided into two projects. The first is the nature of the frictional forces and damping on levitated magnets. Although it is reasonable to suppose this arises from AC losses in the superconductor, magnets rotating about their centre of symmetry should not give fluctuating fields and should form almost frictionless bearings. The second is the direct use of magnetic forces to separate particles of superconducting from non-superconducting material. The major problem here has been the tendency of fine particles to stick together due to electrostatic forces. To overcome this, the authors formed a slurry of the material in liquid nitrogen and flash evaporated the nitrogen to blow particles apart. This was reasonably successful but they do not yet know to what extent they will reagllomerate. A second problem is ensuring thermal equilibrium of the particles. This can be done fairly easily in a liquid slurry, but this limits the useful temperature range and the liquid convection tends to counteract the separation process.

3121 (AD-A–211246/4/XAB) **Physics and materials science of high-temperature superconductors. Final report.** Rossowsky, R.; Methfessel, S. Pennsylvania State Univ., University Park, PA (USA). Applied Research Lab. 26 Aug 1989. 165p. Available from NTIS, PC A08/MF A01.

This report contains the conference program, a list of the abstracts of papers, the poster session abstracts and a list of the participants. The program stressed the physics and materials science of high-temperature superconductors. Subjects covered include: Superconductivity; Superconductive materials; Superconductive ceramics; Magnetic fields; Electrical resistivity; Thermoelectric power measurements; Crystal chemistry; Antiferromagnetic instabilities; Microstructures; Thin films; Electronic structure; Thermodynamics; Critical current density; Grain-boundary chemistry; Oxygen and ion doping; Proximity effect; Superconductor wires; and Epitaxial thin films.

3122 (AEEW-M–2496) **Method for predicting the impact velocity of a projectile fired from a compressed air gun facility.** Attwood, G.J. UKAEA Atomic Energy Establishment, Winfrith (UK). Safety and Engineering Science Div. Mar 1988. 87p. Order Number DE90608623. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

This report describes the development and use of a method for calculating the velocity at impact of a projectile fired from a compressed air gun. The method is based on a simple but effective approach which has been incorporated into a computer program.

The method was developed principally for use with the Horizontal Impact Facility at AEE Winfrith but has been adapted so that it can be applied to any compressed air gun of a similar design. The method has been verified by comparison of predicted velocities with test data and the program is currently being used in a predictive manner to specify test conditions for the Horizontal Impact Facility at Winfrith. (author).

3123 (AEEW-M–2520) **Three-dimensional effects in flask impact testing.** Cooper, C.A.; Neilson, A.J.; Butler, N.; Bazell, C.J. UKAEA Atomic Energy Establishment, Winfrith (UK). Safety and Engineering Science Div. May 1988. 24p. (CONF-8805340–: 1. international conference on transportation for the nuclear industry, Stratford-upon-Avon (UK), 23-25 May 1988). Order Number DE90608625. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A programme of generic impact experiments is being carried out at AEE Winfrith on idealised models of monolithic spent fuel transport flasks. The objectives of the programme is to validate the use of finite element computer codes for the assessment of the performance of these flasks in impact accidents. The computer codes used in the pre-and post-test analyses are HONDO-II (axisymmetric geometries) and DYNA3D (3-dimensional geometries). Both these codes are operational on the UKAEA CRAY computer, thus allowing a direct comparison to be made of the relative cost as well as the accuracy of the simulations. The paper discusses the comparison between the results of pre-test calculations using the HONDO-II code and test measurements for nominally perpendicular impacts of the lid-end of unprotected flasks on a steel-faced block. The observed effects of slightly off-normal impacts are described and are compared with post-test calculations using the DYNA3D code. (author).

3124 (AEEW-R–2033) **Gas velocity measurements in purged port posting systems.** Smith, D.I.; Hollick, R.C. UKAEA Atomic Energy Establishment, Winfrith (UK). Materials Technology Div.; Department of the Environment, London (UK). Feb 1986. 28p. (DOE-RW–88.045). Order Number DE90608626. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A hot film anemometer has been used to measure gas velocities around symmetrical and asymmetrical annular gaps designed to simulate the purged gap in a posting port. The results have been shown to agree with simple theory. Measurement will therefore provide a convenient in-service inspection method and the results have enabled recommendations to be made on manufacturing tolerances which will ensure that predicted gas velocities around purged seals will be maintained. (author).

3125 (CONF-891103–44) **Subcriticality of two uranyl nitrate slab tanks spaced in air by the ^{252}CF-source-driven noise analysis method.** Mihalczo, J.T.; Blakeman, E.D.; Pare, V.K. Oak Ridge National Lab., TN (USA). 14 Aug 1989. 16p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society; San Francisco, CA (USA); 26-30 Nov 1989. Order Number DE90003067. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

As with previous experiments with loosely coupled systems, point kinetics interpretation can be used to obtain neutron multiplication factors if the californium source and detectors are located on the same tank. Although the californium source is located asymmetrically in the system the detectors were sufficiently far apart that the correlated information was from long fission chains which are more nearly fundamental-mode distributed. Examination of the experimental data before interpretation allows an assessment of the applicability of point kinetics. The subcritical neutron multiplication factor for the two tanks has been measured out to separations in air of 57.9 cm, and calculations agree with the experimental results. These experiments confirmed the criteria from previous experiments for location of source and detector to allow point kinetics interpretation of the data. For source detector locations for which point kinetics is not applicable, the theory of Difillippo can be used to obtain the neutron multiplication factor from the ratio of spectral densities. 18 refs., 3 figs., 2 tabs.

3126 (EGG-HFRU–8654) **Human factors evaluation of electroluminescent display #1.** Auflick, J.L. EG and G Idaho, Inc., Idaho Falls, ID (USA). Aug 1989. 18p. Sponsored by U.S. Department of Defense. DOE Contract AC07-76ID01570. Order Number DE90002231. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report consists of an an electroluminescent display, done by scientists and researchers in the Human Factors Research Unit at EG&G, Idaho, Inc. The purpose of this evaluation was to examine the "Sunlight Readability" of one electroluminescent (EL) display; a display which may be incorporated into a new generation of US Army diesel generators. The basic finding of this evaluation is that this particular EL display is not sunlight readable. 2 figs., 10 tabs.

3127 (EGG-M–88271) **Model for measuring complex performance in an aviation environment.** Hahn, H.A. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1988. 5p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-881058–5: Human Factors Society annual meeting, Anaheim, CA (USA), 24-28 Oct 1988). Order Number DE90002055. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

An experiment was conducted to identify models of pilot performance through the attainment and analysis of concurrent verbal protocols. Sixteen models were identified. Novice and expert pilots differed with respect to the models they used. Models were correlated to performance, particularly in the case of expert subjects. Models were not correlated to performance shaping factors (i.e. workload). 3 refs., 1 tab.

3128 (LA-UR–89-3331) **Rf superconductivity research and development at Los Alamos National Laboratory.** Cooke, D.W.; Gray, E.R.; Houlton, R.J.; Lawrence, G.P.; McGill, J.A.; Meyer, E.; Morris, C.; Rusnak, B.; Starke, T.P. Los Alamos National Lab., NM (USA). 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8908145–4: 4. workshop on RF superconductivity, Ibaraki-Ken (Japan), 14-18 Aug 1989). Order Number DE90002440. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Los Alamos National Laboratory is engaged in two distinct areas of rf superconductivity research and development. One program is devoted to studying the rf properties of high-temperature superconductors (HTS) and assessing their potential for accelerator-cavity applications. Our best results to date have come from $YBa_2Cu_3O_7$ films (0.8 μm) electron-beam deposited onto $LaGaO_3$ substrates. A typical surface resistance value is 0.2 $\pm$ 0.1 mΩ measured at 22 GHz and 4 K, which is only a factor of 2–4 higher than Nb. A second area of rf superconductivity R&D at Los Alamos involves fabricating and testing conventional Nb superconducting rf cavities. Facilities are being constructed for polishing, cleaning,and testing both small (3-GHz) and large (805-MHz) Nb cavities. Much of our effort is being devoted to understanding the proper techniques for welding, cleaning, and handling Nb cavities, to ensure good high-field performance. Nb cavity applications are foreseen in upgrades to LAMPF, compact free-electron lasers, and high-current cw proton linacs. A single 402.5-MHz Nb cavity (in a beam cryostat) is presently being acquired from industry to provide a momentum compactor for the low-energy pion beam at LAMPF. 6 refs., 3 figs.

3129 (LBL–27627) **Review of SC/RF refrigeration systems.** Byrns, R.A. Lawrence Berkeley Lab., CA (USA). Aug 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8908145–5: 4. workshop on RF superconductivity, Ibaraki-Ken (Japan), 14-18 Aug 1989). Order Number DE90002460. Available from NTIS, PC A03/MF A01 - OSTI.

A short review is given of historical events in accelerator and cryogenic developments at both Stanford and Berkeley. Methods of refrigeration between 1.85 K and 4.5 K together with modern techniques and improvements are discussed. Where the decade of the 70's was the era of the screw compressor, the 80's can be considered that of the cold vacuum pump for superfluid cooling. Distribution methods are of major importance, and arguments can be made for bath or tube cooling, two-phase, thermo-syphon, supercritical or superfluid. System design affects reliability, safety and operating stability. Distribution costs and heat loads can be a large part of system totals. Some specific system descriptions are included. 18 refs., 20 figs., 2 tabs.

3130 (LBL–27746) **Retractable gas cooled leads for ASTROMAG.** Pope, W.L.; Green, M.A. Lawrence Berkeley Lab., CA (USA). Jul 1989. 8p. Sponsored by U.S. DOE Energy Research; National Aeronautics and Space Administration. DOE Contract AC03-76SF00098. (CONF-890701–19: International cryogenic materials conference, Los Angeles, CA (USA), 24-28 Jul 1989). Order Number DE90002679. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper discusses retractable gas cooled leads for the ASTROMAG experiment superconducting solenoid which will operate on the space station. The ASTROMAG magnet will be cooled by superfluid helium pumped from a storage tank by a fountain effect pump. Since it is desirable to keep the helium consumption low, retractable gas cooled leads are proposed for the ASTROMAG magnet. These leads, which will be in the cryostat vacuum space, will connect directly with the helium flow circuitry which cools the magnet. The leads will operate in a flow circuit separated from the shields. 10 refs., 6 figs.

3131 (LBL–27826) **Design and testing of a superfluid liquid helium cooling loop.** Gavin, L.M.; Green, M.A.; Levin, S.M.; Smoot, G.F.; Witebsky, C. Lawrence Berkeley Lab., CA (USA). Jul 1989. 8p. Sponsored by U.S. DOE Energy Research; National Aeronautics and Space Administration. DOE Contract AC03-76SF00098. NAG5-1123. (CONF-890701–20: International cryogenic materials conference, Los Angeles, CA (USA), 24-28 Jul 1989). Order Number DE90002328. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

This paper describes the design and preliminary testing of a cryogenic cooling loop that uses a thermomechanical pump to circulate superfluid liquid helium. The cooling loop test apparatus is designed to prove forced liquid helium flow concepts that will be used on the Astromag superconducting magnet facility. 3 refs., 2 figs.

3132 (NUREG–0383-Vol.3-Rev.9) **Directory of certificates of compliance for radioactive materials packages: Report of NRC approved quality assurance programs for radioactive materials packages: Volume 3: Revision 9.** Nuclear Regulatory Commission, Washington, DC (USA). Div. of Safeguards and Transportation. Oct 1989. 199p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A10/MF A01 - GPO; OSTI; INIS.

The purpose of this directory is to make available a convenient source of information on packaging which have been approved by the US Nuclear Regulatory Commission. To assist in identifying packaging, an index by Model Number and corresponding Certificate of Compliance Number is included at the front of Volume 2 of the directory. A listing by packaging types is included in the back of Volume 2. An alphabetical listing by Company name is included in the back of Volume 3 for approved QA programs. The Reports include a listing of all users of each package design and approved QA programs prior to the publication date of the directory.

3133 (PB–89-228308/XAB) **Center for Electronics and Electrical Engineering Technical Publication Announcements. Covering center programs, January-March 1989, with 1989 CEEE events calendar.** Walters, E.J. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Center for Electronics and Electrical Engineering. Jul 1989. 20p. (NISTIR–89/4118). Available from NTIS, PC A03/MF A01.

See also PB–89-209241.

This report is the twentieth issue of a quarterly publication providing information on the technical work of the National Institute of Standards and Technology (formerly the National Bureau of Standards) Center for Electronics and Electrical Engineering. The issue covers the first quarter of calendar year 1989. Abstracts are provided by technical area for papers published during the quarter.

3134 (PB–89-872006/XAB) **Hydrodynamic journal bearings: Capacity, wear, and lubrication. January 1973-September 1989 (Citations from Fluidex data base). Report for January 1973-September 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 137p. Available from NTISPC N01/MF N01.

Supersedes PB–88-868484.

This bibliography contains citations concerning the characteristics of hydrodynamic journal bearings. Bearing load, lubrication, thermal effects, tolerance to misalignment, cavitation, and design are discussed. Studies on the effect of temperature and heat transfer on hydrodynamic films are presented. The impact of surface roughness on hydrodynamic journal bearing performance is also examined. (This updated bibliography contains 359 citations, 27 of which are new entries to the previous edition.)

3135 (PB–89-872055/XAB) **Lubricants and greases: Properties and evaluation. January 1973-April 1988 (Citations from Fluidex data base). Report for January 1973-April 1988.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 90p. Available from NTISPC N01/MF N01.

See also PB–89-872063.

This bibliography contains citations concerning properties characterization, additives, rheological studies, and the utilization of a variety of lubricants, including synthetic oils and greases. Bearing and seal lubricants are discussed, and lubricant testing methods are described. Some attention is given to specific applications in industry. (This updated bibliography contains 287 citations, none of which are new entries to the previous edition.)

3136 (PB–89-872063/XAB) **Lubricants and greases: Properties and evaluation. May 1988-September 1989 (Citations from Fluidex data base). Report for May 1988-September 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 69p. Available from NTISPC N01/MF N01.

Supersedes PB–88-863261. See also PB–89-872055.

This bibliography contains citations concerning properties characterization, additives, rheological studies, and the utilization of a variety of lubricants, including synthetic oils and greases. Bearing and seal lubricants are discussed. and lubricant testing methods are described. Some attention is given to specific applications in industry. (This updated bibliography contains 200 citations, all of which are new entries to the previous edition.)

3137 (RISO-M–2801) **CROSS SECTION. Program description and user manual.** Jeppesen, B.; Krenk, S. Risoe National Lab., Roskilde (Denmark). Jul 1989. 28p. Order Number DE90719291. Available from NTIS (US Sales Only), PC A03/MF A01.

The FORTRAN program CROSS-SECTION calculates the properties of an elastic beam cross section. This manual gives a brief summary of the notation and principles, a description of the program structure, a user manual for the input, and an example illustrating the input and output structure. (author) 1 tab., 6 ills., 3 refs.

3138 (SAND–89-0319C) **Autonomous land navigation in a structured environment.** Klarer, P.R. Sandia National Labs., Albuquerque, NM (USA). [1989]. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8911102–1: IEEE international conference on systems, man and cybernetics, Cambridge, MA (USA), 14-17 Nov 1989). Order Number DE90001625. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper describes a hardware and software system developed to perform autonomous navigation of a land vehicle in a structured environment. The vehicle used for development and testing of the system was the Jeep Cherokee Mobile Robotics Testbed Vehicle developed at Sandia National Laboratories in Albuquerque. Since obstacle detection and avoidance have not yet been incorporated into the system, a structured environment is postulated that presumes the paths to be traversed are free of obstacles. The system performs path planning and execution based on maps constructed using the vehicle's onboard navigation system and mapmaker. The system software, hardware, and performance data are discussed. 6 refs.

3139 (SAND–89-1485) **An experimental investigation of wall-interference effects for parachutes in closed wind tunnels.** Macha, J.M.; Buffington, R.J. Sandia National Labs., Albuquerque, NM (USA). Sep 1989. 25p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC04-76DP00789. Order Number DE90001802. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A set of 6-ft-diameter ribbon parachutes (geometric porosities of 7%, 15%, and 30%) was tested in various subsonic wind tunnels

covering a range of geometric blockages from 2% to 35%. Drag, base pressure, and inflated geometry were measured under full-open, steady-flow conditions. The result drag areas and pressure coefficients were correlated with the bluff-body blockage parameter (i.e., drag area divided by tunnel cross-sectional area) according to the blockage theory of Maskell. The data show that the Maskell theory provides a simple, accurate correction for the effective increase in dynamic pressure caused by wall constraint for both single parachutes and clusters. For single parachutes, the empirically derived blockage factor K_M has the value of 1.85, independent of canopy porosity. Derived values of K_M for two- and three-parachute clusters are 1.35 and 1.59, respectively. Based on the photometric data, there was no deformation of the inflated shape of the single parachutes up to a geometric blockage of 22%. In the case of the three-parachute cluster, decreases in both the inflated diameter and the spacing among member parachutes were observed at a geometric blockage of 35%. 11 refs., 9 figs., 3 tabs.

3140 (UCRL–100641) **Inductive store opening switch and tests for energy transfer to a load.** Poulsen, P.; Cutting, J.L.; Hawke, R.S.; McAlice, A.J.; Pincosy, P.A.; Chase, J.B. Lawrence Livermore National Lab., CA (USA). 12 Oct 1989. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890710–24: 5. international conference on megagauss magnetic field generation and related topics, Novosibirsk (USSR), 3-7 Jul 1989). Order Number DE90002818. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Power from the output of an explosive generator can be quickly and efficiently switched by transformer-coupled circuits with a fuse as the switching element. Numerical studies indicate that this technique should be able to switch 2 MA of current into a resistive load of 20 Ω in 100 ns or less, producing in the load a near steady-state pulse with a duration of 1 μs about 100 ns after the switching begins. We report in this paper the results of ongoing experiments to create a fuse with a short switching time (about 100 ns), a high resistance ratio (approximately 300), and adequate voltage holding characteristics. We found that a tamper consisting of both Mylar and SiO grease substantially increases both the resistance ratio of a fuse, and the length of time a high resistance ratio is maintained, relative to what is observed in fuses tamped with Mylar alone. 2 refs., 7 figs.

3141 **Continuous cryopump with a method for removal of solidified gases.** Carlson, L.W.; Herman, H. To Dept. of Energy, Washington, DC. USA Patent 4,838,035. 13 Jun 1989. Filed date 5 May 1988. USA Patent Application 7,190,567. Int. Cl. B01D 8/00. 6p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes an improved cryopump for the removal of gases from a high vacuum. It's comprised of a cryopanel incorporating honeycomb structure, refrigerant means thermally connected to the cryopanel, and a rotatable channel moving azimuthally around an axis located near the center of the cryopanel, removing gases absorbed within the honeycomb structure by subliming them and conducting them outside the vacuum vessel.

3142 (AD-A–210613/6/XAB) **Multiline multimode c-w (continuous-wave) chemical laser performance. Technical report.** Mirels, H. Aerospace Corp., El Segundo, CA (USA). Aerophysics Lab. 1 Jul 1989. 44p. (TR–0088(3907)-1). Available from NTIS, PC A03/MF A01.

Effects of translational rotational nonequilibrium large-scale c-w chemical laser performance are evaluated for the case of a Fabry-Perot resonator with multiple longitudinal modes. Numerical results are presented for the limit Delta nu Sub c << Delta nu sub h << Delta nu sub d, where Delta nu sub c, Delta nu sub h, and Delta nu sub d denote longitudinal mode separation, homogeneous width, and Doppler width, respectively. Results include the effect of threshold gain on the power in each longitudinal mode, the power associated with each rotational energy level, and the net laser power. In the case of a saturated laser, an increase of threshold gain results in an increase in the output from strong rotational transitions at the expense of the output from weak rotational transitions. Total output is reduced. With further increase of threshold gain, the output from all rotational transitions is reduced. The case of rotational nonequilibrium and translational equilibrium is also considered. The latter case, a common assumption, is shown to provide net output power that is intermediate between the values for rotational and translational equilibrium and for rotational and translational nonequilibrium.

3143 (AD-A–210706/8/XAB) **300-Watt dye laser for field experimental site.** Everett, P.N. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. 1988. 8p. (MS–7997). Available from NTIS, PC A02/MF A01.

Pub. in Proceedings of the International Conference on Lasers '88, 404-409(1988).

A 6-beam flashlamp-pumped dye-laser system is being installed at a field site. Each beam will produce 5 to 10 Joules in 2-microsec pulses at 10 pps. Design, installation, and initial performance will be reviewed.

3144 (AD-A–210708/4/XAB) **Efficient nonlinear conversion of laser-diode-pumped miniature solid-state laser sources. Final report, 1 May 1986-30 April 1989.** Gerstenberger, D.C.; Wallace, R.W. Lightwave Electronics Corp., Mountain View, CA (USA). Jun 1989. 37p. Available from NTIS, PC A03/MF A01.

This research program has dealt with the development of efficient and compact sources of visible laser light based on the nonlinear optical conversion of the outputs of diode pumped solid state lasers. Intracavity frequency doubling, frequency doubling of continuous wave single frequency nonplanar ring Nd:YAG lasers in external resonant cavities and single pass doubling of diode pumped Q-switched lasers were studied. Nonlinear materials including lithium diffused lithium niobate, magnesium oxide doped lithium niobate and potassium titanyl phosphate were examined. We obtained 45 mW of cw green light from an monolithic externally resonant cavity constructed of MgO:$LiNbO_3$ pumped by a 200 mW single-frequency Nd:YAG laser. This doubler was electro-optically locked into resonance with the laser oscillator and maintained at phasematching temperature by a miniature platinum hybrid heater-sensor element and control circuit. Peak power $LiNbO_3$ over 200 mW in the green were measured with this doubling device when pumped by a single frequency pulsed 500 mW source.

3145 (AD-A–210758/9/XAB) **Semiconductor quantum-well lasers and related optoelectronic devices on silicon, III-V. Technical report.** Holonyak, N.; Hsieh, K.C.; Stillman, G.E. Illinois Univ., Urbana, IL (USA). Dept. of Electrical and Computer Engineering. Jun 1989. 35p. (TR–1). Available from NTIS, PC A03/MF A01.

Although an ultimate goal of this work is to achieve long term reliable laser operation of Al(x)Ga(1-x)As-GaAs quantum-well heterostructures (QWH's), or similar III-V QWH's, grown on Si, this has proven to be a formidable enough problem that to the best of our knowledge no one has exceeded the results we reported in 1987 and 1988. This problem is of such dimensions that it may not be solved for as much as 10 years, or even more. All we know so far is that continuous (cw) 300 K Al(x)Ga(1-x)As-GaAs QWH lasers can be grown on Si, and that, indeed, the heat sinking of an Al(x)Ga(1-x)As-GaAs QWH laser on Si is better than a similar laser on a GaAs substrate. Nevertheless, the problem of growing better versions of these devices (i.e., long-lived high-performance cw 300 K lasers on Si) has run into the fundamental issue of the large GaAs-Si lattice and thermal expansion mismatch, and hence the built-in difficulty in reducing the defects guaranteed by mismatch. The authors worked further on the problem of Al(x)Ga(1-x)As-GaAs QWH lasers on Si, other QWH laser problems, as well as an impurity-induced layer disordering (or layer intermixing, IILD) and its application in laser devices this work is briefly described.

3146 (AD-A–210769/6/XAB) **Dissociation and vibrational relaxation of XeF by various collision partners.** Bott, J.F.; Heidner, R.F.; Holloway, J.S.; Koffend, J.B.; Kwok, M.A. Aerospace Corp., El Segundo, CA (USA). Laboratory Operations. 15 Jul 1989. 26p. (TR–0088(3930-04)-2). Available from NTIS, PC A03/MF A01.

The removal rates of the lower levels of XeF strongly affect the overall efficiency of the XeF excimer laser operating on the B yields X transitions. The authors have deduced the removal rates of XeF(X,v = 3) in krypton, xenon, nitrogen, and carbon dioxide and the removal rates of XeF(X,v = 0) in sulfur hexafluoride by monitoring the populations of vibrational levels formed by the photolysis XeF_2. The time history of the selected vibrational population is monitored with a continuous-wave (cw) tunable dye laser tuned to an absorption feature of the selected vibrational/rotational level. The studies show a rapid vibrational relaxation followed by a common decay rate of the coupled vibrational levels. The rare gases were found to remove XeF (X) with rate coefficients that differed from one another by less than a factor of 1.6. Larger removal-rate coefficients were measured for molecular-collision partners, with XeF_2 having the largest rate coefficient. Rate coefficients were also determined for the concerted vibrational relaxation of v = 3 although the values do not represent state-to-state rate coefficients. Fast vibrational relaxation is required to empty the lower levels of the laser transitions so the vibrational bottlenecking does not terminate laser action prematurely.

3147 (AD-A–210778/7/XAB) **Noise levels in a tunable CO_2 laser source.** Kachelmyer, A.L.; Eng, R.S. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. Dec 1988. 17p. (MS–8060). Available from NTIS, PC A03/MF A01.

Pub. in Proceedings of the International Conference on Lasers '88, 322-338 (4-9 Dec 1988).

This reprint considers the measurement of amplitude modulation (AM) and phase modulation (PM) noise in a tunable CO_2 laser source. Theoretical and experimental heterodyned output spectrums compare the tunable source to a clean reference laser.

3148 (AD-A–210780/3/XAB) **Binary micro optics: An application to beam steering.** Goltsos, W.; Holz, M. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. 1989. 12p. (MS–8285). Available from NTIS, PC A03/MF A01.

Pub. in SPIE Volume 1052 - Holographic Optics: Optically and Computer Generated, 131-141(1989).

Agile steering of a helium-neon laser beam (lambda = 632.8nm) was demonstrated using a complementary pair of 5-cm-aperture diffractive microlens arrays in the Galilean telescopic geometry. Having as many as 60,000 F/5 microlenses, each with parabolic phase profile and 200 micrometers diameter, results in nearly aberration-free beam steering over 11 deg. field of view for top + or - 100 micrometers lateral displacements of one array relative to the other. Wavefront quality and steering efficiency of the deflected beam has been measured as a function of steering angle and is compared to a simple theoretical model.

3149 (AD-A–210844/7/XAB) **Coupled multiline c-w (continuous-wave) HF (hydrogen fluoride) lasers: Experimental performance. Technical report.** Bernard, J.M.; Chodzko, R.A.; Mirels, H. Aerospace Corp., El Segundo, CA (USA). Aerophysics Lab. 1 Jul 1989. 26p. (TR–0086A(2060)-2). Available from NTIS, PC A03/MF A01.

The experimental performance of two coupled arc-driven continuous-wave HF chemical lasers employing unstable resonators has been measured. Mode-matched adjoint coupling of 20% was accomplished with a beam splitter. Multiline interference fringes were obtained when the two laser output beams were overlapped in the near field. The mutual coherence of the two beams was inferred from measurement of the visibility of these fringes. Single-line fringe visibility was measured as 98% +/- 2% for each of the two strongest lines. These data suggest that the two outputs are nearly completely phase-locked. This locking was found to be insensitive to perturbations in the lengths of the laser resonators. Mode-beating measurements also suggest complete phase locking, as the coupled system behaves like a single laser cavity. The coherent combination of the two laser output beams was attempted by minimizing the optical path difference between these beams, at an external measuring station. This was achieved by changing the external path length of one beam until maximum multiline visibility (97%) was obtained. Demonstration of the corresponding far-field peak intensity enhancement and reduction in spot size for the combined outputs was also accomplished.

3150 (AD-A–210861/1/XAB) **Electroabsorption in single quantum-well GaAs laser structures.** DeTemple, T.A. Illinois Univ., Urbana, IL (USA). 1 May 1989. 4p. Available from NTIS, PC A02/MF A01.

Pub. in Applied Physics Letters, Vol. 54, No. 18, 1716-1718(1 May 1989).

The electric-field-dependent spectral properties of a GaAs graded-barrier quantum-well heterostructure laser are measured for the first time. Data presented show that the electroabsorption below the band gap is due to states in the confinement layers perturbed by the quantum well under high field conditions. This effect, which is intermediary between the quantum confined Stark effect and bulk Franz Keldysh effect, should be present in all quantum well system with shallow wells in short, high field-depletion regions.

3151 (AD-A–210879/3/XAB) **Non-reciprocity of autoionizing interferences: Lasers without inversion.** Harris, S.E. Stanford Univ., CA (USA). Edward L. Ginzton Lab. 29 Sep 1988. 6p. Available from NTIS, PC A02/MF A01.

Pub. in OSA Proceedings on Short Wavelength Coherent Radiation: Generation and Applications, Vol. 2, 414-417(26-29 Sep 1988).

Interferences of autoionizing lines may reduce or eliminate absorption of lower level atoms. Stimulated emission shows no such interferences, thereby allowing laser gain without population inversion.

3152 (AD-A–210947/8/XAB) **Lasers without inversion: Interference of lifetime-broadened resonances.** Harris, S.E. Stanford Univ., CA (USA). Edward L. Ginzton Lab. 27 Feb 1989. 5p. Available from NTIS, PC A02/MF A01.

Pub. in Physics Review Letters, Vol. 62, No. 9, 1033-1036(27 Feb 1989).

If two upper levels of a four-level laser system are purely lifetime broadened, and decay to an identical continuum, there will be an interference in the absorption profile of lower-level atoms; this interference is absent from the stimulated-emission profile of the upper-level atoms. Laser amplification may then be obtained without inversion. Examples include interfering autoionizing levels, and tunneling systems.

3153 (AD-A–211039/3/XAB) **Modulation mixing in a multimode dye laser.** Koch, K.; Chakmakjian, S.H.; Papademetriou, S.; Stroud, C.R. Rochester Univ., NY (USA). Inst. of Optics. 1 Jun 1989. 8p. Available from NTIS, PC A02/MF A01.

Pub. in Physical Review A, Vol. 39, No. 11, 5744-5750(1 Jun 1989).

An argon-ion laser, modulated at two or more frequencies is used to pump a multimode dye laser. Time series of the modulated pump and the output of the dye laser are collected simultaneously. The dye-laser response is analyzed for the presence of chaotic and quasi-periodic attractors. One can estimate and compare the correlation dimension and the order-2 Renyi entropy of both the modulated-pump and dye-laser output signals using an embedding-space technique. Fourier transforms of the time series are also compared.

3154 (AD-A–211117/7/XAB) **Laser physics and laser techniques. Final report.** Siegman, A.E. Stanford Univ., CA (USA). Edward L. Ginzton Lab. Jun 1989. 259p. Available from NTIS, PC A12/MF A01.

Several areas of Laser Physics and Laser Techniques are reported on, including ultrafast physical measurements; the development of a new subpicosecond time-response photodetector; identification and analysis of an important new quantum-noise limit for unstable laser oscillators; and useful advances in stable and unstable laser resonator theory.

3155 (LA–11567-MS) **Mixing of gases in large volumes by forced injection.** Greiner, N.R.; Heaton, R.C.; Hemberger, P.H.; Cisper, M.E.; Sandoval, W.F.; Alarid, J.E. Los Alamos National Lab., NM (USA). Oct 1989. 23p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE90001811. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes a set of experiments that demonstrate a gas mixing procedure suitable for use with large chemical lasers having cylindrical geometry. Mixing is accomplished by forceful injection of one of the reactive gas components into a reaction chamber containing all the other components of the desired final mixture. Experimental data are presented for mixing chambers 0.25 m and 1 m in diameter, although the procedure should be usable for even larger volumes. Schlieren images obtained in the smaller of the two volumes provide a good visualization of the mixing process and show that the injection concept is valid. These data also show that the optical quality of the gas mixing recovers within a few tenths of a second after the injection is complete. Mass spectrometric measurements taken at various points in the larger of the two volumes reveal oscillations in the injected gas concentration for about 60 s after injection. The turbulent mixing process is probably complete at that time. However, there is evidence of possible concentration gradients of a few percent across the vessel under some injection conditions. These apparent gradients persist for many minutes and are probably stabilized by buoyancy effects. The gas injection causes a temperature excursion in the vessel of typically 6 K. This decays to 3 degrees in approximately 40 s. The temperature excursion does not appear to depend on the amount of injected gas for the cases studied. 2 refs., 10 figs., 1 tab.

3156 (LA-UR–89-3394) **Lasing on the third harmonic.** Warren, R.W.; Haynes, L.C.; Feldman, D.W.; Stein, W.E.; Gitomer, S.J. Los Alamos National Lab., NM (USA). [1989]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908134–12: 11. international free electron laser conference, Naples, FL (USA), 28 Aug - 1 sep 1989). Order Number DE90002389. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Los Alamos Free-Electron Laser has recently lased near 4 μm on the third harmonic of the fundamental frequency of about 12 μm. By choice of intercavity apertures and cavity length, lasing can be forced to occur on both frequencies simultaneously or on either one alone. 8 refs., 3 figs., 1 tab.

3157 (LA-UR–89-3395) **High-field pulsed microwigglers.** Warren, R.W.; Feldman, D.W.; Preston, D. Los Alamos National Lab., NM (USA). [1989]. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908134–11: 11. international free electron laser conference, Naples, FL (USA), 28 Aug - 1 sep 1989). Order Number DE90002388. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Conventional wigglers made with periods of less than a few centimeters generate light of short wavelength, but usually have low gain because of their low fields. Iron-free electromagnets driven by high pulsed currents can generate the high fields needed. We will discuss the design and construction of such magnets. 4 refs., 7 figs.

3158 (LA-UR–89-3406) **Compact rf-linac free-electron lasers.** Goldstein, J.C.; Sheffield, R.L.; Carlsten, B.E.; Warren, R.W. Los Alamos National Lab., NM (USA). 1989. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908134–9: 11. international free electron laser conference, Naples, FL (USA), 28 Aug - 1 sep 1989). Order Number DE90002386. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Design studies using the INEX simulation methods are presented for an infrared compact rf-linac-driven FEL. The possibility of such a device relies upon two technological advances: a very bright electron beam from a linac with a photocathode injector, and a short-period, high-field wiggler. 10 refs., 6 figs., 3 tabs.

3159 (LA-UR–89-3438) **Optical design and performance of an XUV FEL [free-electron laser] oscillator.** Goldstein, J.C.; McVey, B.D.; Newnam, B.E. Los Alamos National Lab., NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908134–8: 11. international free electron laser conference, Naples, FL (USA), 28 Aug - 1 sep 1989). Order Number DE90002381. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A study of numerical simulation of the performance of a multifacet metal mirror ring resonator FEL is presented for several XUV wavelengths. Laser performance in the presence of mirror aberrations and thermal distortion is calculated for two different output coupling methods, a scraper mirror and a hole. 11 refs., 1 fig.

3160 (LA-UR–89-3581) **Theory of harmonic radiation using a single-electron source model.** Schmitt, M.J.; Elliott, C.J. Los Alamos National Lab., NM (USA). [1989]. 20p. Sponsored by U.S. Department of Defense; U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908134–16: 11. international free electron laser conference, Naples, FL (USA), 28 Aug - 1 sep 1989). Order Number DE90002412. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Significant progress has recently been made toward the understanding of the various mechanisms that generate harmonic radiation in plane-polarized free electron lasers. Within the context of a single-frequency coherent-spontaneous emission model, a distributed transverse source function for a single electron has been derived. This source is multiply peaked, with the number of peaks being equal to the harmonic number. The peaks and nulls in the radiation source are analogous to the radiation peaks seen in the spontaneous radiation pattern of a single electron. When the distributed source function is averaged over transverse space, the simplified one-dimensional results are recovered. The distributed source function model predicts the generation of even harmonic radiation with odd-symmetry in the electron wiggle plane (for electrons traveling along the wiggler axis) and odd harmonic radiation patterns with even transverse symmetry. A method for modeling the multi-pole nature of the harmonic radiation on a discrete grid is described. When the transverse electron beam distribution is slowly varying, all the harmonics can be adequately modeled with multipoles having only a few peaks. This model has been incorporated into the 3-D FEL simulation code FELEX. Simulations of the Los Alamos and Stanford FEL oscillators have been performed. How the harmonic transverse spatial electric field profiles change for different operating conditions is examined. 11 refs., 5 figs.

3161 (N–89-27871 vp) **Operational parameters for the superconducting cavity maser.** Wang, R.T.; Dick, G.J.; Strayer, D.M. Jet Propulsion Lab., Pasadena, CA (USA). May 1989. (NASA-CR–185431;JPL-TDA-PR–42-97;NAS–1.26:185431). In *The Telecommunications and Data Acquisition Report.* Available from NTIS, PC A17/MF A01.

Tests of the superconducting cavity maser (SCM) ultra-stable frequency source have been made for the first time using a hydrogen maser for a frequency reference. In addition to characterizing the frequency stability, the sensitivity of the output frequency to several crucial parameters was determined for various operating conditions. Based on this determination, the refrigeration and thermal control systems of the SCM were modified. Subsequent tests showed substantially improved performance, especially at the longest averaging times.

3162 (N–89-27871 vp) **Operating and environmental characteristics of Sigma Tau hydrogen masers used in the Very Long Baseline Array (VLBA).** Tucker, T.K. Jet Propulsion Lab., Pasadena, CA (USA). May 1989. (NASA-CR–185431;JPL-TDA-PR–42-97;NAS–1.26:185431). In *The Telecommunications and Data Acquisition Report.* Available from NTIS, PC A17/MF A01.

Presented here are the results obtained from performance evaluation of a pair of Sigma Tau Standards Corporation Model VLBA-112 active hydrogen maser frequency standards. These masers were manufactured for the National Radio Astronomy Observatory (NRAO) for use on the Very Long Baseline Array (VLBA) project and were furnished to the Jet Propulsion Laboratory (JPL) for the purpose of these tests. Tests on the two masers were performed in the JPL Frequency Standards Laboratory (FSL) and included the characterization of output frequency stability versus environmental factors such as temperature, humidity, magnetic field, and barometric pressure. The performance tests also included the determination of phase noise and Allan variance using both FSL and Sigma Tau masers as references. All tests were conducted under controlled laboratory conditions, with only the desired environmental and operational parameters varied to determine sensitivity to external environment.

3163 (N–89-27871 vp) **A novel approach to a PPM-modulated frequency-doubled electro-optic cavity-dumped**

Nd:YAG laser. Robinson, D.L. Jet Propulsion Lab., Pasadena, CA (USA). May 1989. (NASA-CR–185431;JPL-TDA-PR–42-97;NAS–1.26:185431). In *The Telecommunications and Data Acquisition Report.* Available from NTIS, PC A17/MF A01.

A technique which can provide frequency doubling, with high efficiency, while cavity dumping a laser for pulse position M-ary modulation while being used for an optical communication link is discussed. This approach uses a secondary cavity that provides feedback of the undoubled fundamental light, which is normally lost, into the primary cavity to be recirculated and frequency doubled. Specific operations of the electrooptic modulator and frequency-doubling crystal are described along with the overall modulation scheme and experimental setup.

3164 (N–89-28118, pp. 249-252) **Diode-pumped laser research.** Ramos-Izquierdo, L.; Bufton, J.L.; Chan, K. National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center. 1988. (NASA-TM–101257;NAS–1.15:101257). In *Laboratory for Oceans.* Available from NTIS, PC A12/MF A01.

The Laboratory for Oceans is currently working on the development of compact laser diode array (LD) pumped Nd:YAG lasers for use in space-based altimetry and ranging. Laser diode-array pumping technology promises to increase the electrical to optical efficiency of solid state lasers by an order of magnitude with a lifetime increase of nearly three orders of magnitude relative to today's conventional flashlamp-pumped laser systems. The small size, efficiency, and ruggedness make LD-pumped solid state lasers ideal for space based applications. In an in-house RTOP effort, a novel multiple-pass LD-pumped Nd:YAG laser amplifier was designed and tested to increase the 100 microjoule output pulse energy of the Lightwave laser oscillator. Preliminary results have yielded a round trip amplifier gain of about 15 percent using 7 microjoule LD-pump energy. As a parallel activity, funding was recently obtained to investigate the possible use of custom made fiber optic arrays to obtain an efficient optical coupling mechanism between the emitting laser diode-arrays and the target solid state laser material. Fiber optic coupling arrays would allow for the easy manipulation of the spatial emitting pattern of the diode pump sources to match either an end or side pumping laser configuration.

3165 (PB–89-870935/XAB) **Excimer lasers: Applied research and commercial development. January 1980-September 1989 (Citations from the Searchable Physics Information Notices data base). Report for January 1980-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 123p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869367.

This bibliography contains citations concerning research, development, testing, stability, and reliability of both XeCl and XeF excimer lasers. Excimer laser utilization for vapor-deposited coating processes, cardiovascular surgery, and microelectronics fabrication are presented. Laser etching of polymers, diamonds, and hard carbon films are discussed. Construction of very large excimer-laser amplifiers and comparative analysis of wide-band excimer lasers with optical or electron-beam-pumping are examined. (This updated bibliography contains 293 citations, 68 of which are new entries to the previous edition.)

3166 (UCRL–21254) **Theory for high gain, high power free electron lasers: Final report.** Colson, W.B. Lawrence Livermore National Lab., CA (USA); Berkeley Research Associates, Inc., CA (USA). 1989. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (BRA–89-342R). Order Number DE90003024. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In the past contracting period, the research on high gain, high power free electron lasers (FELs) has been fruitful. The findings have resulted in publications, presentations, and some important new research topics in progress. The work has been accomplished in close collaboration with the FEL physicists at LLNL including weekly visits to the LLNL Beam Research Building. The new research proposed is also coordinated closely with specific LLNL FEL project physicists, and the upcoming high-gain, high-power amplifier experiments during the next year on the Paladin FEL. The research includes analysis of the initial ELF experiments, identification of new FEL physics in Paladin at 5m length, electron beam distributions from future induction linacs, electron beam distributions in weak optical fields, a major FEL review paper, a simple understanding of FEL optical guiding, multimode analysis applied to single-pass FEL amplifiers, a LLNL review talk on FEL sidebands and electron distribution functions. 3 refs.

3167 (UCRL–100891) **Prospects for a soft x-ray FEL powered by a relativistic-klystron high-gradient accelerator (RK-HGA).** Shay, H.D.; Barletta, W.A.; Yu, S.S.; Schlueter, R.; Deis, G.A. Lawrence Livermore National Lab., CA (USA). 28 Sep 1989. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-8908134–15: 11. international free electron laser conference, Naples, FL (USA), 28 Aug - 1 sep 1989). Order Number DE90002822. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We present here the concept of x-ray FELs using high gain, single-pass amplifiers with electron beams accelerated in high gradient structures powered by relativistic klystrons. Other authors have also considered x-ray FELs; the unique aspect of this paper is the use of high gradient acceleration. One of the authors has previously presented preliminary studies on this concept. The intent in this paper is to display the results of a top level design study on a high gain FEL, to present its sensitivity to a variety of fabrication and tuning errors, to discuss several mechanisms for increasing gain yet more, and to present explicitly the output characteristics of such an FEL. The philosophy of the design study is to find a plausible operating point which employs existing or nearly existing state-of-the-art technologies while minimizing the accelerator and wiggler lengths. The notion is to distribute the technical risk as evenly as possible over the several technologies so that each must advance only slightly in order to make this design feasible. This study entailed no systematic investigation of possible costs so that, for example, the sole criterion for balancing the trade-off between beam energy and wiggler length is that the two components have comparable lengths. 20 refs., 10 figs., 1 tab.

3168 (UCRL–102044) **Laser glass (1989).** Weber, M.J. Lawrence Livermore National Lab., CA (USA). Oct 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8911121–1: 2. international symposium on new glass, Tokyo (Japan), 29-30 Nov 1989). Order Number DE90002754. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Glasses play many and varied roles in laser systems, both passive and active. Properties of special interest include the transparency for transmitting optical components, absorption and emission spectra and excited state lifetimes of paramagnetic ions for amplifying media, magnetooptic properties for optical isolators, acoustooptic properties for optical modulators, and nonlinear optical properties for controlling beam propagation and for photonic switching. In this paper we review briefly the role and extent to which glasses have been used for lasing. Although the exploitation of glass for lasers is a mature activity, it is not exhausted. The number of glass lasers actually demonstrated is much smaller, and the number of commercial laser glasses is smaller still. 22 refs., 1 fig., 2 tabs.

3169 Effect of mode competition on the efficiency of FEL oscillators in the low gain regime. Levush, B. (Univ. of Maryland (US)); Antonsen, T.M.; Serbeto, A. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 2P38.

In this paper the efficiency of energy extraction from the electron beam in low gain FEL oscillators is investigated. Using a normalized beam in low gain FEL oscillators is investigated. Using a normalized set of nonlinear equations the optimum values of the efficiency is presented. The efficiency obtained by utilizing the multimode model is compared with the results from the single mode model.

3170 Ultrahigh brightness XeCl laser system. Tallman, C.R. (Lawrence Livermore National Lab., CA (USA)); Taylor, A.J.; Roberts, J.P.; Lester, C.S.; Gosnell, T.R.; Long, W.H. pp. 443 of

OSA conference on lasers and electro-optics (1989 Technical Digest series). Optical Society of America, Washington, DC (1989). (CONF-890423–: CLEO '89: conference on lasers and electro optics, Baltimore, MD (USA), 24-28 Apr 1989).

Technical Paper TUJ46.

High brightness excimer laser systems are being used to explore the interaction of intense coherent UV radiation with matter. Applications of current systems include the generation of picosecond x-ray pulses, investigations of possible x-ray laser pumping schemes, studies of multiphoton phenomena in atomic species, and time-resolved photchemistry. Systems based on the amplification of subpicosecond pulses in small aperture (– 1-cm^2) XeCl or KrF amplifiers routinely deliver focal spot intensities in excess of 10^{17} W/Cm^2. Scaling to higher intensities requires an additional large aperture amplifier which preserves near diffraction limited beam quality and subpicosecond pulse duration. The authors describe here a large aperture 1-Hz XeCl system designed to deliver 0.5-J subpiosecond pulses and yield intensities on target in excess of 10^{19} W/cm^2.

3171 Design and operation of high efficiency electron-beam-initiated chemical lasers. York, G.W. (Los Alamos National Lab., NM (USA)); Quigley, G.P.; Salesky, E.T. pp. 443 of OSA conference on lasers and electro-optics (1989 Technical Digest series). Optical Society of America, Washington, DC (1989). (CONF-890423–: CLEO '89: conference on lasers and electro optics, Baltimore, MD (USA), 24-28 Apr 1989).

Technical Paper THA5.

This paper describes a new electron-beam initiated laser system developed at Los Alamos to explore a recently discovered operating regime of chemical lasers. This parameter space is attained by initiating a chemical reaction weakly and over a long time duration while maintaining a high internal optical flux within the laser cavity throughout the burn. By operating in this regime, relatively high specific energies can be produced at extremely high electrical efficiencies. The device developed to explore this parameter space is shown. A preliminary design is presented for a laboratory system.

3172 Thermal stress in the edge cladding of Nova glass laser disks. Pitts, J.H. (Lawrence Livermore National Lab., PO Box 5508, Livermore, CA 94550 (USA)); Kong, M.K.; Gerhard, M.A. vp of Proceedings of the 12th symposium on fusion engineering. IEEE Service Center, Piscataway, NJ (1987). DOE Contract W-7405-ENG-48. (CONF-871007–: 12. symposium on fusion engineering, Monterey, CA (USA), 12-16 Oct 1987).

The authors calculated thermal stresses in Nova glass laser disks having light-absorbing edge cladding glass attached to the periphery with an epoxy adhesive. Closed-form solutions indicated that, because the epoxy adhesive is only 25 μm across, it does not significantly affect the thermal stress in the disk or cladding glass. Numerical results showed a peak tensile stress in the cladding glass of 24 MPa when the cladding glass had a uniform absorption coefficient of 7.5 cm^{-1}. This peak value is reduced to 19 MPa if surface parasitic oscillation heating is eliminated by tilting the disk edges. The peak tensile stresses exceed the typical 7 to 14-MPa working stress for glass; however, have not observed any disk or cladding glass failures at peak Nova fluences of 20 J/cm^2. They have observed delamination of the epoxy adhesive bond at fluences several times that which would occur on Nova. Replacement laser disks will incorporate cladding with a reduced absorption coefficient of 4.5 cm^{-1}. Recent experiments show that this reduced absorption coefficient is satisfactory.

3173 Dynamics of coupled electron-nucleon motion in a laser field. Hartmann, F.X. (Institute for Defense Analyses, Alexandria, Virginia (US)); Garcia, K.K.; Munro, J.K. Jr.; Noid, D.W. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 87-92 (1 Oct 1988). Sponsored by U.S. DOE Energy Research. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

Energy transfer processes in single particle coupled nucleon-electron models interacting with an intense laser field are studied using semi-classical quantization of the coupled classical Hamiltonian.

3174 Absolute rate measurements of two-photon process of gases, liquids, and solids. Chen, C.H. (Chemical Physics Section, Oak Ridge, National Laboratory Oak Ridge, Tennessee 37831-6378 (US)); McCann, M.P.; Payne, M.G. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 130-132 (1 Oct 1988). Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

Due to rapid improvements in high-power laser performance, two-photon absorption processes have become a very useful tool for studying the molecular structures of various gases, liquids and solids. However, measurements of absolute two-photon absorption cross sections were more or less ignored previously because of their small size. In this work, we obtained not only the two-photon absorption spectra, but also measurements of their absolute cross sections for various gases, liquids, and solids.

3175 Measurement of transition moments between molecular excited electronic states using the Autler-Townes effect. Lau, A.M.F. (Combustion Research Facility, Sandia National Laboratories, Livermore, CA 94550 (US)); Chandler, D.W.; Quesada, M.A.; Parker, D.H. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 133-135 (1 Oct 1988). Sponsored by U.S. DOE Energy Research. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

This paper reports the observation of the Autler-Townes splitting in the two-color four-photon ionization of hydrogen molecules, and the good agreement of theory with experiment. From the theoretical fits to the spectral profiles, the value of the electric dipole transition moment between the excited vibronic states $E,F^1\Sigma^+_g$, v=6 and $D^1\Pi_u$, v'=2 is determined to be 2.0±0.5 a.u.

3176 The suppression of stimulated hyper-Raman emission in Na due to parametric four-wave mixing. Moore, M.A. (Chemical Physics Section, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6378 (US)); Garrett, W.R.; Payne, M.G. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 139-141 (1 Oct 1988). Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

We show that an interference effect involving four-wave mixing can almost totally suppress predicted examples of stimulated hyper-Raman emission in the forward direction of a laser pump beam. The effect is demonstrated in Na vapor.

3177 Nonlinear absorption of CO_2 laser radiation in p-type InSb. James, R.B. (Sandia National Laboratories, Livermore, CA 94550 (US)); Chang, Y.C.; Smith, D.L. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 186-189 (1 Oct 1988). Sponsored by U.S. DOE Albuquerque Operations Office. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

Calculations of the intervalence-band absorption saturation in p-type InSb by high-intensity CO_2 laser light are reported. The intensity-dependent absorption coefficient is found to be well described by an inhomogeneously broadened two-level model, and values of the saturation intensity are presented.

3178 Excited state absorption of Sm^{2+} in SrF_2. Payne, S.A. (University of California, Lawrence Livermore National Laboratory, P.O. Box 808, Livermore, CA 94550 (US)); Chase, L.L.; Krupke, W.F. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA),* 172(1): 413-418 (1 Oct 1988). Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-871147–: 3. international laser science conference: advances in laser science, Atlantic City, NJ (USA), 1-5 Nov 1987).

The excited state absorption spectrum of Sm^{2+} in SrF_2 has been observed. The absorption peaks associated with the $^5D_0(4f^6)$ excited state were found to be displaced by approximately 3000 cm^{-1} from the absorption bands arising from the $^7F_0(4f^6)$ ground state (after taking the $^5D_0$–$^7F_0$ energy separation into account). The

observed peak separation is ascribed to the 4f–5d exchange interaction. From the measured peak positions, the exchange energy for the Sm^{2+} impurity was determined to be about the same order of magnitude as expected for the free ion. The implications of the properties of the excited state absorption bands for the performance of the $SrF_2:Sm^{2+}$ laser are considered.

3179 **Liquid excimers: lasing Xe_2 and Kr_2 in liquid argon.** Loree, T.R. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)); Showalter, R.R.; Johnson, T.M.; Birmingham, B.S.; Hughes, W.M. *Optics Letters (USA)*, 14(19): 1051-1053 (1 Oct 1989).

By pumping a small cryogenic cell with a 40-nsec, 1-MeV *e*-beam pulse, we have excited lasing in dilute mixtures of xenon or krypton in liquid argon. The lasing occurred at 175 nm for the excimer Xe_2 and at 147 nm for Kr_2.

3180 **Low-frequency self-pulsations in asymmetric external-cavity semiconductor lasers due to multiple-feedback effects.** Park, J. (Optoelectronic Device Physics Group, Center for High Technology Materials, University of New Mexico, Albuquerque, New Mexico 87131 (US)); Seo, D.; McInerney, J.G.; Dente, G.C.; Osinski, M. *Optics Letters (USA)*, 14(19): 1054-1056 (1 Oct 1989).

We investigate the dynamical stability of external-cavity semiconductor lasers with deliberate tilt asymmetries. Experimentally observed low-frequency self-pulsations are explained by small-signal analysis based on a new rate-equation model that uses a time-dependent effective reflectivity to include multiple-feedback effects. We observe and explain the dependence of the self-pulsation frequency on the strength and degree of asymmetry of the feedback, on the injection current, and on the external-cavity length. These results are important in interpreting instabilities, chaos, and other complex dynamical phenomena in external-cavity semiconductor lasers.

3181 **Waveguide mode deformation in free-electron lasers.** Fajans, J. (Department of Physics, University of California, Berkeley, Berkeley, California 94720 (US)); Wurtele, J.S. *Physics of Fluids B: Plasma Physics (USA)*, 1(10): 2073-2084 (Oct 1989).

The free-electron laser (FEL)-induced modifications to the vacuum waveguide modes are calculated for low-frequency FEL's. Typically, the mode modifications are large and exhibit complicated axial behaviors. In addition to the wave component with a near vacuum wavenumber, components at two upshifted wavenumbers must be analyzed. Electron beam surface charges and currents are also important. At low gain, effects from all three roots of the FEL dispersion relation must be included. The dominant modification is due to the electron beam space-charge wave.

3182 **Linear analysis of a free-electron laser coupled to betatron oscillations.** Latham, P.E. (Laboratory for Plasma Research, University of Maryland, College Park, Maryland 20742 (US)). *Physics of Fluids B: Plasma Physics (USA)*, 1(10): 2085-2098 (Oct 1989).

The dispersion relation is derived for the interaction of a sheet beam propagating between parallel plates in a planar wiggler magnetic field. Instead of the usual free electron laser (FEL) mode, one is considered in which the radiation field is perpendicular to the quiver velocity and couples either to betatron or plasma oscillations. In the cold beam limit, coupling to betatron oscillations leads to an absolute instability. This mode competes with the conventional FEL and can disrupt the beam unless suppressed. The effects of energy spread are investigated, and a critical energy spread is found that suppresses the instability. For ultrarelativistic beams, this energy spread is an exponentially decreasing function of the beam energy. For moderately relativistic high current beams, it is proportional to the square root of the beam current. In this regime, there is a limit to the current that can propagate stably in the FEL circuit. Coupling to plasma oscillations also leads to an instability. However, the instability associated with this mode can be made convective with a suitable choice of parameters, and thus is not particularly dangerous to the conventional FEL. It is, however, interesting because the dispersion relation is characteristic of a second harmonic FEL, even though the wiggler is planar.

3183 **Transition from quantum-noise-driven dynamics to deterministic dynamics in a multimode laser.** Beck, M. (The Institute of Optics, University of Rochester, Rochester, New York 14627 (US)); McMackin, I.; Raymer, M.G. *Physical Review [Section] A: General Physics (USA)*, 40(5): 2410-2416 (1 Sep 1989).

The fluctuation behavior of the mode amplitudes in a multimode dye laser near threshold is investigated numerically. The laser is modeled by semiclassical, third-order laser theory that includes a stochastic Langevin force to simulate quantum noise. We find two different limiting types of behavior. Just above the lasing threshold the mode fluctuations are found to be dominated by quantum noise, while above a certain pump power the fluctuations are found to be essentially deterministic. The effect of pump fluctuations is also simulated. We find that a multimode laser acts as a low-pass filter on the pump fluctuations, as is found for a single-mode laser.

3184 **Improved laser-beam uniformity using the angular dispersion of frequency-modulated light.** Skupsky, S. (Laboratory for Laser Energetics, University of Rochester, 250 East River Road, Rochester, New York 14623-1299 (US)); Short, R.W.; Kessler, T.; Craxton, R.S.; Letzring, S.; Soures, J.M. *Journal of Applied Physics (USA)*, 66(8): 3456-3462 (15 Oct 1989).

A new technique is presented for obtaining highly smooth focused laser beams. This approach is consistent with the constraints on frequency tripling the light, and it will not produce any significant high-intensity spikes within the laser chain, making the technique attractive for the high-power glass lasers used in current fusion experiments. Smoothing is obtained by imposing a frequency-modulated bandwidth on the laser beam using an electro-optic crystal. A pair of gratings is used to disperse the frequencies across the beam, without distorting the temporal pulse shape. The beam is broken up into beamlets, using a phase plate, such that the beamlet diffraction-limited focal spot is the size of the target. The time-averaged interference between beamlets is greatly reduced because of the frequency differences between the beamlets, and the result is a relatively smooth diffraction-limited intensity pattern on target.

3185 (AD-A–211107/8/XAB) **Survey of measurements and measuring techniques in rapidly distorted compressible turbulent boundary layers.** Fernholz, H.H.; Dussauge, J.P.; Finlay, P.J.; Smits, A.J.; Reshotko, E. Advisory Group for Aerospace Research and Development (AGARD), 92 - Neuilly-sur-Seine (France). May 1989. 132p. (AGARD-AG–315). Available from NTIS, PC A07/MF A01.

A large body of data for incompressible turbulent boundary layers was accumulated over many years by many investigations. The measurements revealed elements of the structure of this complex flow. Three-dimensional multiple-scale phenomena were observed, and there is the beginning of an understanding of the details of the structure and physics. This will lead to more-realistic models and physical understanding, which will be primary inputs into concepts of control of these turbulent boundary layers and will provide a framework to validate computations. At high speed, where compressibility is important, there is a paucity of data. The measurements are difficult to obtain and are not easily analyzed. At the same time, there appear to be some possibilities for simplification inherent in rapid distortion theory where the turbulent structure may be frozen if the disturbance is of short duration. There is a critical need for data to evaluate this concept, to provide a base for models of turbulence in compressible flows to compare with imcompressible flows, to provide a more-substantial base for our physical understanding, and to provide a framework for the evaluation of the extensive computations currently underway. 3186 (AEEW-R–2201) **Calculated performance of a "hot-patch" for steady state post dryout experiments.** Hood, M.L. UKAEA Atomic Energy Establishment, Winfrith (UK). Safety and Engineering Science Div. Dec 1987. 20p. Order Number DE90608605. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

In the emergency cooling of water-cooled nuclear reactors, for example, there is a need for data on the heat transfer from hot dry surfaces to a coolant having a low thermodynamic quality. Such data are difficult to obtain because the surface tends to rewet, in a transient fashion, from the ends of the experimental test-section. In an attempt to prevent this rewetting, hot patches have been attached to the ends of the test-section. These are heated blocks of high thermal conductivity, capable of providing a local heat flux high enough to dry out the encroaching rewetting front. This paper presents the results of calculations on the performance of such a hot patch. The heat transfer near the dryout point is represented by an idealised boiling curve and steady state solutions are obtained for the temperature distribution within the hot patch and the surface heat flux. The stable position of the dryout point is calculated to be upstream of the hot patch at low pressure. As the pressure is increased the dryout point moves towards the hot patch. At a sufficiently high pressure it moves into and through the hot patch, so that a steady state cannot be sustained. The effects on the hot patch performance of internal cracks and of changes in design geometry are also presented. (author).

3187 (CONF-8906112–2) **Interfacial area in two-phase flow.** Ishii, M; Tan, M.J. Argonne National Lab., IL (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 7. symposium on energy engineering sciences; Argonne, IL (USA); 19-21 Jun 1989. Order Number DE90002210. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Knowledge of interfacial area is required for analysis and prediction of transient and steady characteristics of two-phase flow systems using the two-fluid models. Based on a survey of published work on the subject of interfacial area, it is recognized that there is virtually no data base for local interfacial area. This paper describes the ongoing development of interfacial area models and experimental techniques for measurement of local interfacial area concentration in gas-liquid and liquid-liquid two-phase systems. Mathematical relations between local interfacial area concentration and measurable quantities are derived based on kinematics and geometry. Two methods for determining local interfacial area are identified; both entail detection of passage of interfaces through fixed locations in the flow field. A multiple-sensor electrical-resistivity-probe technique is being developed for determination of local interfacial area in vertical gas-liquid bubbly flows. The technique consists of simultaneous measurements at two or four locations in the two-phase flow field of the local electrical resistivity of the two-phase mixture. Methods for data analysis are described. Limitations of the technique are briefly discussed. 16 refs.

3188 (FRNC-TH–3474) **Jet instabilities in liquid-liquid systems. Application to direct contact heat exchangers.** Tadrist, L. Aix-Marseille-1 Univ., 13 - Marseille (France). 1987. 307p. (In French). Order Number DE90721102. Available from NTIS (US Sales Only), PC A14/MF A01.

The behavior of a fluid injected in an immiscible fluid is studied. Results concerning the mean diameter of the drops resulting from a jet rupture, are directly correlated with the vortex dimensions, just before the breaking of the jet. Water, for the immiscible phase, and dodecane, for the miscible phase, are applied as fluid models. The drop by drop, laminar and turbulent flow models are discussed. The jet evolution from the injector up to the drops formation is studied under different flow models, taking into account different jet injection velocities. The study of the resolution for a cylindrical column resolution, comparison to the planar interface case, the axisymmetric and non-axisymmetric perturbation cases are given. The experimental device, the measurement principles and methods are explained, and the liquid-liquid system is analyzed.

3189 (INIS-BR–1686) **Thermohydraulic analysis of smooth and finned annular ducts.** Braga, C.V.M. Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Engenharia Mecanica. 1987. 339p. (In Portuguese). Order Number DE90608607. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The present work is concerned with the turbulent heat transfer and pressure drop in smooth and finned annular ducts overage heat transfer coefficients have been obtained by means of the heat exchanger theory. In addition, friction factors have also been determined. The experiments were performed by utilizing four double-pipe heat exchangers. The flowing fluids, in the heat exchangers, were air and water. The average heat transfer coefficients, for air flowing in the annular section, were determined by measuring the overall heat transfer coefficients of the heat exchangers. In order to attain fully developed conditions, the heat exchangers had a starting length of 30 hydraulic diameters. The thermal boundary conditions consisted of uniform temperature on the inner surface, the outer surface being insulated. The heat transfer coefficients and friction factors are presented in dimensionaless forms, as functions of the Reynolds number of the flow. The results for the smooth and finned annular ducts were compared. The purpose of such comparison was to study the influence of the fins on the pressure drop and heat transfer rate. In the case of the finned nular ducts, it is shown that the fin efficiency has some fluence on the heat transfer rates. The, a two-dimensional at transfer analysis was performed in order to obtain the n efficiency and the annular region efficiency. It is also shown that the overall thermal performance of finned surfaces epends mainly on the Nusselt number and on the region eficiency. These parameters are presented as functions of the Reynolds number of the flow and the geometry of the problem. (author).

3190 (INIS-BR–1691) **Falling-sphere radioactive viscometry.** Souza, R. de. Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia. 1987. 449p. (In Portuguese). Order Number DE90608608. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

In this work the falling sphere viscometric method was studies experimentally using a sphere tagged with ^{198}Au radiosotopo, the objective being the demosntration of the advantages of this technique in relation to the traditional method. The utilisation of the falling radioactive sphere permits the point-point monitoring of sphere position as a function of count rate. The fall tube wall and end effects were determined by this technique. Tests were performed with spheres of different diameters in four tubes. The application of this technique demosntrated the wall and end effects in sphere speed. The case of sphere fall in the steady slow regime allowed the determination of the terminal velocity, showing the increase of botton end effect as the sphere approaches the tube base. In the case the transient slow regime, the sphere was initially in a state of respose near the top surface. The data obtained show the influence of the free surface and wall on the sphere acceleration. These experimental data were applied to the Basset equation on order to verify the behaviour of the terms in this equation. (author).

3191 (LiU-Tek-Lic–1989-04) **Some heat transfer problems with phase change processes. Numerical and experimental analysis.** Linkoeping studies in science and technology. (no. 164). Moshfegh, B. Linkoeping Univ. (Sweden). Dept. of Mechanical Engineering. 1989. 11p. Order Number DE90719414. Available from NTIS (US Sales Only), PC A03/MF A01.

Linkoeping studies in science and technology.; (no. 164).

The research emphasizes the numerical treatment of heat transfer characteristics of the models including phase change processes. Computational models were presented for the prediction of temperature. The finite element method, FEM, was used for the simulations. The predicted temperature for the food in a food container and the inner and outer surface temperatures of the triple-glazing window were also experimentally determined. The experimental results and the comparison with numerical simulations have shown that the proposed models provide a correct qualitative and quantitative representation of the heat transfer characteristics for the food container and the low-emissive triple-glazing window. Therefore this method can be used extensively for theoretical analysis and optimization of the heat transfer characteristics for models, including phase change processes under different, operational conditions and it is also indispensable for reducing the number of expensive time-consuming tests. (author).

3192 (LNCC–009/89) **Error analysis of some Galerkin - least squares methods for the elasticity equations.** Franca, L.P.; Stenberg, R. Laboratorio Nacional de Computacao Cientifica, Rio de

Janeiro, RJ (Brazil). May 1989. 28p. Order Number DE90608611. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

We consider the recent technique of stabilizing mixed finite element methods by augmenting the Galerkin formulation with least squares terms calculated separately on each element. The error analysis is performed in a unified manner yielding improved results for some methods introduced earlier. In addition, a new formulation is introduced and analyzed.

3193 (LNCC–010/89) **Finite element approximations of the stokes flow problem based upon various variational principles.** Franca, L.P.; Hughers, T.J.R.; Stenberg, R. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). May 1989. 17p. Order Number DE90608612. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Finite element methods are constructed by adding to the usual Galerkin method terms that are mesh-dependent least-squares forms of the Euler-Lagrange equations. The methods are consistent and possess additional stability compared to the Galerkin method. Finite element interpolations, which are unstable in the Galerkin approach, are now convergent. The methodology is applied to the velocity-pressure formulation, a.k.a., Herrmann's formulation, to the stress-velocity formulation, a.k.a., Hellinger-Reissner's formulation and to a new formulation based on augmented stress, pressure and velocity.

3194 (LNCC–011/89) **Strong source heat transfer simulations based on a GalerKin/Gradient - least - squares method.** Franca, L.P.; Carmo, E.G.D. do. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). May 1989. 17p. Order Number DE90608613. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Heat conduction problems with temperature-dependent strong sources are modeled by an equation with a laplacian term, a linear term and a given source distribution term. When the linear-temperature-dependent source term is much larger than the laplacian term, we have a singular perturbation problem. In this case, boundary layers are formed to satisfy the Dirichlet boundary conditions. Although this is an elliptic equation, the standard Galerkin method solution is contaminated by spurious oscillations in the neighborhood of the boundary layers. Herein we employ a Galerkin/Gradient-least-squares method which eliminates all pathological phenomena of the Galerkin method. The method is constructed by adding to the Galerkin method a mesh-dependent term obtained by the least-squares form of the gradient of the Euler-Lagrange equation. Error estimates, numerical simulations in one-and multi-dimensions are given that attest the good stability and accuracy properties of the method.

3195 (N–89-17298, pp. 81-84) **Comparison of turbulence measurement methods.** Fralick, G.C. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

An experiment is described in which temperature (density) and velocity are measured separately but simultaneously as functions of time so that it is possible to determine the relationships among velocity, density, and the product of density and velocity. Temperatures were measured with a dual-wire thermocouple probe. Velocity data were supplied by a fringe laser-Doppler anemometer. Signals from thermocouples and the laser were recorded on FM magnetic tape for later processing.

3196 (N–89-17298, pp. 85-90) **Aerothermal modeling program. Phase 2, element A: improved numerical methods for turbulent viscous recirculating flows.** Karki, K.C. (Analytic and Computational Research, Inc., Los Angeles, CA (USA)); Mongia, H.C.; Patankar, S.V.; Runchal, A.K. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objective of this effort is to develop improved numerical schemes for predicting combustor flow fields. Various candidate numerical schemes were evaluated, and promising schemes were selected for detailed assessment. The criteria for evaluation included accuracy, computational efficiency, stability, and ease of extension to multidimensions. The candidate schemes were assessed against a variety of simple one- and two-dimensional problems. These results led to the selection of the following schemes for further evaluation: flux spline schemes (linear and cubic) and controlled numerical diffusion with internal feedback (CONDIF). The incorporation of the flux spline scheme and direct solution strategy in a computer program for three-dimensional flows is in progress.

3197 (N–89-17298, pp. 91-99) **Aerothermal modeling program. Phase 2, element B: Flow interaction experiment.** Nikjooy, M. (Purdue Univ., West Lafayette, IN (USA)); Mongia, H.C.; Murthy, S.N.B.; Sullivan, J.P. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

NASA has instituted an extensive effort to improve the design process and data base for the hot section components of gas turbine engines. The purpose of element B is to establish a benchmark quality data set that consists of measurements of the interaction of circular jets with swirling flow. Such flows are typical of those that occur in the primary zone of modern annular combustion liners. Extensive computations of the swirling flows are to be compared with the measurements for the purpose of assessing the accuracy of current physical models used to predict such flows.

3198 (N–89-17298, pp. 111-118) **Application of advanced diagnostics to airblast injector flows.** Mcvey, J.B.; Kennedy, J.B.; Russell, S. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

This effort is concerned with the application of both conventional laser velocimetry and phase Doppler anemometry to the flow produced by an airblast nozzle. The emphasis is placed on the acquisition of data using actual engine injector/swirler components at (noncombusting) conditions simulating those encountered in the engine. The objective of the effort was to test the applicability of the instrumentation to real injector flows, to develop information on the behavior of injectors at high flow, and to provide data useful in the development of physical models of injector flows.

3199 (N–89-17298, pp. 169-179) **Measurement of airfoil heat transfer coefficients on a turbine stage.** Dring, R.P.; Blair, M.F.; Joslyn, H.D. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

A combined experimental and analytical program was conducted to examine the impact of a number of variables on the midspan heat transfer coefficients of the three airfoil rows in a one and one-half stage large scale turbine model. Variables included stator/rotor axial spacing, Reynolds number, turbine inlet turbulence, flow coefficient, relevant stator 1/stator 2 circumferential position, and rotation. Heat transfer data were acquired on the suction and pressure surfaces of the three airfoils. High density data were also acquired in the leading edge stagnation regions. Extensive documentation of the steady and unsteady aerodynamics was acquired. Finally, heat transfer data were compared with both a steady and an unsteady boundary layer analysis.

3200 (N–89-17298, pp. 199-209) **Two- and three-dimensional turbine blade row flow field simulations.** Buggeln, R.C.; Briley, W.R.; Mcdonald, H.; Shamroth, S.J.; Weinberg, B.C. National Aeronautics and Space Administration, Cleveland, OH

(USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

Work performed in the numerical simulation of turbine passage flows via a Navier-Stokes approach is discussed. Both laminar and turbulent simulations in both two and three dimensions are discussed. An outline of the approach, background, and an overview of the results are given.

3201 (N–89-17298, pp. 211-223) **Coolant passage heat transfer with rotation.** Hajek, T.J. (United Technologies Research Center, East Hartford, CT (USA)); Wagner, J.H.; Johnson, B.V. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objective is to develop a heat transfer and pressure drop data base, computational fluid dynamic techniques and heat transfer correlations for rotating multipass coolant passages, with and without flow tabulators. The experimental effort is focused on the simulation of configurations and conditions expected in the blades of advanced aircraft high pressure turbines. With the use of this data base, the effects of Coriolis and buoyancy forces on the coolant side flow can be included in the design of turbine blades.

3202 (N–89-17298, pp. 225-238) **Turbine airfoil film cooling.** Hylton, L.D.; Nirmalan, V.; Sultanian, B.K.; Kaufman, R.M. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The experimental data obtained in this program gives insight into the physical phenomena that occur on a film cooled airfoil, and should provide a relevant data base for verification of new design tools. Results indicate that the downstream film cooling process is a complex function of the thermal dilution and turbulence augmentation parameters with trends actually reversing as blowing strength and coolant-to-gas temperature ratio varied. The pressure surface of the airfoil is shown to exhibit a considerably higher degree of sensitivity to changes in the film cooling parameters and, consequently, should prove to be more of a challenge than the suction surface in accurately predicting heat transfer levels with downsteam film cooling.

(NASA-CR–184905;NAS–1.26:184905;SU-CTR-S–88;CONF-8806435–: Summer program on studying turbulence using numerical simulation databases, Stanford, CA (USA), 27 Jun - 22 jul 1988). Available from NTIS, PC A13/MF A01.

Original contains color illustrations.

The focus of the program was on the use of direct numerical simulations of turbulent flow for study of turbulence physics and modeling. A special interest was placed on turbulent mixing layers. The required data for these investigations were generated from four newly developed codes for simulation of time and spatially developing incompressible and compressible mixing layers. Also of interest were the structure of wall bounded turbulent and transitional flows, evaluation of diagnostic techniques for detection of organized motions, energy transfer in isotropic turbulence, optical propagation through turbulent media, and detailed analysis of the interaction of vortical structures.

3204 (N–89-24538, pp. 29-39) **Phase decorrelation, streamwise vortices and acoustic radiation in mixing layers.** Ho, C. M.; Zohar, Y.; Moser, R. D.; Rogers, M. M.; Lele, S. K.; Buell, J. C. Stanford Univ., CA (USA). Dec 1988. (NASA-CR–184905;NAS–1.26:184905;SU-CTR-S–88;CONF-8806435–: Summer program on studying turbulence using numerical simulation databases, Stanford, CA (USA), 27 Jun - 22 jul 1988). In *Studying turbulence using numerical simulation databases, 2. Proceedings of the 1988 Summer Program.* Available from NTIS, PC A13/MF A01.

Several direct numerical simulations were performed and analyzed to study various aspects of the early development of mixing layers. Included are the phase jitter of the large-scale eddies, which was studied using a 2-D spatially-evolving mixing layer simulation; the response of a time developing mixing layer to various spanwise disturbances; and the sound radiation from a 2-D compressible time developing mixing layer.

3205 (N–89-24538, pp. 287-309) **Head-on collision of viscous vortex rings.** Stanaway, S. (Houston Univ., TX (USA)); Shariff, K.; Hussain, F. Stanford Univ., CA (USA). Dec 1988. (NASA-CR–184905;NAS–1.26:184905;SU-CTR-S–88;CONF-8806435–: Summer program on studying turbulence using numerical simulation databases, Stanford, CA (USA), 27 Jun - 22 jul 1988). In *Studying turbulence using numerical simulation databases, 2. Proceedings of the 1988 Summer Program.* Available from NTIS, PC A13/MF A01.

The head-on collision of two identical axisymmetric viscous vortex rings is studied through direct simulations of the incompressible Navier-Stokes equations. The initial vorticity distributions considered are those of Hill's spherical vortex and of rings with circular Gaussian cores, each at Reynolds numbers of about 350 and 1000. The Reynolds number is defined by Gamma/Nu, the ratio of circulation to viscosity. As the vortices approach each other by self-induction, the radii increase by mutual induction, and vorticy cancels through viscous cross-diffusion across the collision plane. Following contact, the vorticity distribution in the core forms a head-tail structure (for the cases considered). The characteristic time of vorticity annihilation is compared with that of a 3D collision experiment and 3D numerical simulations. It is found that the annihilation time is somewhat longer in the axisymmetric case than it is in the symmetry plane of the experiment and 3D numerical simulation. By comparing the annihilatiom time with a viscous timescale and a circulation timescale, it is deduced that both the strain rate due to local effects and to 3D vorticity realignment are important.

3206 (N–89-27115) **Calculation of turbulence-driven secondary motion in ducts with arbitrary cross section.** Demuren, A.O. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Jul 1989. 23p. (NASA-TM–102142;ICOMP–89-16;E–4941;NAS–1.15:102142). Available from NTIS, PC A03/MF A01.

Calculation methods for turbulent duct flows are generalized for ducts with arbitrary cross-sections. The irregular physical geometry is transformed into a regular one in computational space, and the flow equations are solved with a finite-volume numerical procedure. The turbulent stresses are calculated with an algebraic stress model derived by simplifying model transport equations for the individual Reynolds stresses. Two variants of such a model are considered. These procedures enable the prediction of both the turbulence-driven secondary flow and the anisotropy of the Reynolds stresses, in contrast to some of the earlier calculation methods. Model predictions are compared to experimental data for developed flow in triangular duct, trapezoidal duct and a rod-bundle geometry. The correct trends are predicted, and the quantitative agreement is mostly fair. The simpler variant of the algebraic stress model procured better agreement with the measured data.

3207 (UCRL–100847) **Time-dependent free convection in low Prandtl number fluids.** McClelland, M.A. Lawrence Livermore National Lab., CA (USA). 25 Oct 1989. 41p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-7405-ENG-48. (CONF-891113–7: American Institute of Chemical Engineers annual meeting, San Francisco, CA (USA), 5-10 Nov 1989). Order Number DE90003053. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A numerical analysis is given for time-dependent free convection in a fluid with small Prandtl number. Consideration is given to a long two-dimensional cavity with vertical walls maintained at different temperatures. The results are relevant to the electron beam vaporization of liquid metals. The spatial problem is solved with the Galerkin finite element method, and a backward Euler method with step-size control is used to perform the time integration. For cases

involving large convection and numerical instabilities, streamwise diffusion is introduced with an approach sharing some features in common with the Taylor-Galerkin and Petrov-Galerkin methods. Solutions are given for a Prandtl number of 0.015 and Grashof numbers between 10^4 and 10^7, corresponding to the transition region between steady-state laminar and turbulent flow. The results reveal the effects of added streamwise diffusion along with mesh and time-step refinement. 17 figs.

3208 **Effect of density change on rapid liquid-solid interface kinetics and heat flow.** Richards, P.M. (Sandia National Labs., Albuquerque, NM (US)). pp. 763 of Fundamentals of beam-solid interactions and transient thermal processing. Aziz, M.J.; Rehn, L.E.; Stritzker, B. Materials Research Society, Pittsburgh, PA (1988). DOE Contract AC04-76DP00789. (CONF-8711126–: Symposium on fundamentals of beam-solid interactions and transient thermal processing, Boston, MA (USA), 30 Nov - 3 dec 1987).

In this paper consequences of the need to transport density to or from a fast-moving liquid-solid interface are examined. There can be a severe limitation of the freezing velocity and a change in the amount of heat which must be conducted. The latter effect produces a net latent heat which can be significantly different from the equilibrium value and even change sign.

3209 **Comparisons of two-phase microgravity calculations using current and new flow regime maps in RELAP5.** Bagwell, T.G. (Texas A & M Univ., College Station (USA)); Hassan, Y.A.; Blanchat, T.K. *Transactions of the American Nuclear Society (USA),* 57: 176-177 (1988). (CONF-881011–: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

Recently, many experiments designed to quantify the parameters involved in microgravity two-phase flow have been performed. These experiments give significant insight to the differences between the flow regimes in 1-g and microgravity. However, the new correlations for pressure drop, heat transfer, and the flow regime maps are yet to be implemented into analytical methods. The purpose of this study is to model a KC-135 microgravity experiment, using the thermal-hydraulic does RELAP5/MOD2 and ATHENA. A comparison of these experimental results to code calculations from RELAP5/MOD2 and ATHENA is shown. Results show little difference between the ATHENA and the RELAP5 calculations. Also, modifications are made to the two-phase flow regime map in RELAP5 to model microgravity predictions. There is a substantial difference between the code's calculation before and after the changes were implemented. The heat transfer correlations of the code should be revised to take into account the effects of microgravity. Also, more data are needed for the verification of the microgravity transition criterion.

3210 **Viscosity of a phase-separating critical mixture.** Krall, A.H. (Univ. of Maryland, College Park (USA)); Sengers, J.V.; Hamano, K. *International Journal of Thermophysics (USA),* 10(2): 309-319 (Mar 1989). (CONF-880606–: 10. symposium on thermophysical properties, Gaithersburg, MD (USA), 20-23 Jun 1988).

Onuki has predicted the existence of a significant enhancement of the viscosity of a liquid mixture in the course of spinodal decomposition. The authors discuss a method to measure this effect in a critical mixture of isobutyric acid and water in which spinodal decomposition is induced by a pressure-quench technique. In addition, by varying the static pressure in the homogeneous phase, experimental information about the dynamic critical exponent for the viscosity is obtained.

3211 **Magnetically suspended centrifuge for studies of nonlinear phenomena in stratified fluids: Developmental aspects.** Gillies, G.T. (Department of Nuclear Engineering and Engineering Physics, University of Virginia, Charlottesville, Virginia 22901 (US)); Lawson, M.A.; Ritter, R.C.; Lawkins, W.F.; Thompson, S.; Sartory, W.K. *Review of Scientific Instruments (USA),* 60(10): 3293-3300 (Oct 1989). DOE Contract AC05-84OR21400.

Design studies of a novel magnetically suspended centrifuge suggest that such a device would be useful for investigating the nonlinear dynamics of interfacial waves in a rotating two-phase liquid. In its final form, the apparatus would use magnetic bearings, a directly-driven rotor, precision temperature control, and vibration isolation. The mechanical noise in the magnetic suspension coil of a preliminary apparatus was measured to be 3-μm rms in a 5-kHz bandwidth. However, these vibrations were attenuated by an active differentiator to the point where there was no observable oscillation in a 183-gram suspended test mass.

3212 (AD-A–211225/8/XAB) **Neutron-radiography system for field use. Final report.** Antal, J.J.; Marotta, A.S.; Farese, L.J. Army Materials Research Agency, Watertown, MA (USA). Materials Technology Lab. Jun 1989. 20p. (MTL-TR–89-52). Available from NTIS, PC A03/MF A01.

The use of neutrons as penetrating radiation expands the role of radiological nondestructive examination considerably. Radiological examination by neutrons has been limited, however, by the need to perform such radiography at the site of a nuclear reactor or a large accelerator system which can provide neutrons of an intensity equal to that of industrial X-ray sources. A mobile neutron radiological system has been designed as a prototype for the examination of lightweight aircraft structures in the field. The neutron source for this system is a very small commercially available (d,t) accelerator which provides an on-off radiation source and a size, weight, and shielding requirement acceptable for routine neutron examination in the manner of high-energy X-ray radiological systems. Under a variety of field maintenance conditions, this system has successfully provided useful neutron radiography at resonable exposure times and has pointed the way to a means for bringing neutron radiography to the worksite. In addition to the technological advances introduced, acceptance of this small source system as a nondestructive examination tool has required rethinking on the part of NDE professionals and reeducation of technicians regarding the goals of radiographic examinations. Experience with this unit, is reported both in the field and in the laboratory where it serves as a resource for further neutron-source developments and the exploration of new applications of on-site neutron radiological examinations.

3213 (CONF-890770–3) **Application of neutron diffraction NDE to high-temperature superconducting composites.** Kupperman, D.S.; Singh, J.P.; Majumdar, S.; Raptis, A.C.; Hitterman, R.L. Argonne National Lab., IL (USA). Aug 1989. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From Conference on review of progress in quantitative NDE; Brunswick, ME (USA); 23-28 Jul 1989. Order Number DE90002184. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Argonne Intense Pulsed Neutron Source and General Purpose Powder Diffractometer have been used to study high-$T_c$metal oxide composites composed of yttrium, barium, copper, oxygen, and silver. Neutron diffraction techniques were applied to composites with 15, 20, and 30% silver content by volume. We have observed that after sintering, the 30%-silver specimens contained both orthorhombic high-$T_c$and tetragonal, non-superconducting phases near the center of the specimens but only the orthorhombic phase near the surface. We have also observed residual tensile strains in Ag as a function of crystallographic direction; three strains range from as high as 0.085% in 15% Ag samples to as low as about 0.02% in a 30% Ag sample. Compressive strains in the YBCO (111) crystallographic direction were approximated by correcting for the diffraction peak shift due to changes in stoichiometry with varying Ag content. The estimated compressive-strain values vary from 0.04% (15% Ag) to 0.09% (20% Ag) to 0.01% (30% Ag), with an uncertainty of about 0.03%. The decrease in strain in YBCO for the 30% Ag composite is consistent with the decrease in Ag strain and may be due to additional creep of the composite. 11 refs., 3 figs.

3214 (CONF-8806370–) **The modeling of wear in energy conversion and utilization technologies: Proceedings.** Nichols, F.A.; Michaels, A.I.; Northcutt, L.A. (eds.). Argonne National Lab., IL (USA). Jun 1989. 182p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. From International workshop on wear modeling: the modeling of wear in energy

conversion and utilization technologies; Argonne, IL (USA); 16-17 Jun 1988. Order Number DE90001889. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The proceedings of the Conference on Tribology in the area of Wear Life Prediction of Mechanical Components, at the General Motors Research Laboratories, sponsored by the Industrial Research Institute, were issued in 1985. Much discussion in the tribological community followed and resulted in the Workshop on the Use of Surface Deformation Models to Predict Tribology Behavior, held at Columbia University. The proceedings of that workshop were published under the tile of "Approaches to Modeling of Friction and Wear." Numerous recommendations were made by the various panels involved in the latter workshop concerning the modeling of tribological processes in general and wear processes in particular. Several factors were especially highlighted, namely the "need for a clearer understanding, sufficient data to evaluate the models, and the lack of alternative methods to obtain the desired information." The discussions and recommendations of the Columbia workshop provided a strong impetus for the present workshop. In parallel with that, a very significant publication appeared outside the usual tribology literature which offered the promise of an internally consistent methodology or framework for elucidating various wear mechanisms, tying together disparate data obtained with multitudinous wear-measuring apparatus under widely differing conditions, and applying test data so analyzed to real applications. Such correlations have eluded researchers for many years. 31 refs., 31 figs.

3215 (CONF-8905112–3) **A computer-controlled automated test system for fatigue and fracture testing.** Nanstad, R.K.; Alexander, D.J.; Swain, R.L.; Hutton, J.T.; Thomas, D.L. Oak Ridge National Lab., TN (USA). 1989. 31p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From ASTM symposium on the applications of automation technology to fatigue; Kansas City, MO (USA); 22-23 May 1989. Order Number DE90002931. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A computer-controlled system consisting of a servohydraulic test machine, an in-house designed test controller, and a desktop computer has been developed for performing automated fracture toughness and fatigue crack growth testing both in the laboratory and in hot cells for remote testing of irradiated specimens. Both unloading compliance and dc-potential drop can be used to monitor crack growth. The test controller includes a dc-current supply programmer, a function generator for driving the servohydraulic test machine to required test outputs, five measurement channels (each consisting of low-pass filter, track/hold amplifier, and 16-bit analog-to-digital converter), and digital logic for various control and data multiplexing functions. The test controller connects to the computer via a 16-bit wide photo-isolated bidirectional bus. The computer, a Hewlett-Packard series 200/300, inputs specimen and test parameters from the operator, configures the test controller, stores test data from the test controller in memory, does preliminary analysis during the test, and records sensor calibrations, specimen and test parameters, and test data on flexible diskette for later recall and analysis with measured initial and final crack length information. During the test, the operator can change test parameters as necessary. 24 refs., 6 figs.

3216 (PB–89-228290/XAB) **Computer-controlled test system for operating different wear-test machines.** Whitenton, E.P.; Ruff, A.W. National Inst. of Standards and Technology (IMSE), Gaithersburg, MD (USA). Jul 1989. 50p. (NISTIR–89/4107). Available from NTIS, PC A03/MF A01.

This report discusses a wear-tester control system, where the same computer and software runs three different wear-test machines; a commercial crossed-cylinder, a commercial block-on-ring, and an in-house designed controlled-atmosphere tribometer. The computer hardware, the interface to the wear test machines, and the aspects that make the machines functionally similar are examined. The program itself, its use, and the data file structure are also explored.

This report provides bibliographic citations, with selected abstracts, for 131 publications that appeared in the open literature, primarily during calendar year 1985. A detailed subject index is included as well as information on how copies of many of the publications may be obtained.

3218 (PB–89-872618/XAB) **Lubrication for high and extreme pressures. January 1974-September 1989 (Citations from Fluidex data base). Report for January 1974-September 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 135p. Available from NTISPC N01/MF N01.

Supersedes PB–88-853072.

This bibliography contains citations concerning extreme-pressure lubricants. Coverage includes methods and results of testing of extreme-pressure (EP) lubricants, measurement of properties and changes to these properties when EP lubricants are subjected to extreme pressures, additives and effects of additives to EP lubricants, and applications of EP lubricants. Some abstracts pertain to the sealing of lubricants and hydraulic fluids under extreme pressure conditions. Other citations refer to analysis of machine parts as part of the testing of EP lubricants, and effects of lubricant failure. (This updated bibliography contains 347 citations, 45 of which are new entries to the previous edition.)

3219 (PB–89-872824/XAB) **Lubrication for high and extreme pressures. January 1971-September 1989 (Citations from the US Patent data base). Report for January 1971-September 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 67p. Available from NTISPC N01/MF N01.

Supersedes PB–88-867577.

This bibliography contains citations of selected patents concerning compositions and applications of extreme pressure (EP) lubricants. The citations include compositions and methods of producing lubricant additives containing boron, sulfur, phosphorous, organic compounds, and metal complexes. Applications include lubricants for gears, metal working, wire drawing, vehicles, and machines. (This updated bibliography contains 152 citations, 27 of which are new entries to the previous edition.)

3220 (SAND–89-2198C) **Performance characteristics of a three-stage railgun.** Asay, J.R.; Hawke, R.S. Sandia National Labs., Albuquerque, NM (USA). [1989]. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909229–2: Aeroballistic Range Association meeting, Paris (France), 24-28 Sep 1989). Order Number DE90002533. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Hypervelocity launchers are used to study the high-pressure equation of state of materials in regimes inaccessible by other methods. Two-stage light gas guns have been extremely useful for these applications, but have a practical velocity limit of about 8–9 km/s for impact studies. In this paper, we describe a three-stage launcher consisting of a two-stage light gas gun combined with a third-stage railgun, which overcomes previous velocity limitations pertaining to two-stage guns. This launcher is being developed for operation to 15 km/s and has achieved projectile velocities of 7.2 km/s to date. 10 refs., 9 figs., 1 tab.

3221 (UCRL–100810) **Hugoniot measurements with the LLNL electric gun facility.** Gathers, G.R.; Chau, H.H.; Osher, J.E.; Weingart, R.C. Lawrence Livermore National Lab., CA (USA). Jul 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890812–62: American Physical Society topical conference on shock compression of condensed matter, Albuquerque, NM (USA), 14-17 Aug 1989). Order Number DE90002809. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A wide class of materials exists with properties that are not consistent enough to justify making very accurate EOS measurements. Some are nonhomogeneous two-phase materials consisting of a matrix and an embedded material. In order to represent these materials in hydrocode simulations, one is usually driven to substituting

another material which has (hopefully) similar properties. The Equation of State (EOS) of the material is usually the most important description needed. We have been developing a technique to make EOS measurements on such materials using the LLNL electric gun facility. 2 refs., 3 figs., 1 tab.

3222 (AD-A-210264/8/XAB) **Bias and oxide thickness dependence of trapped-charge buildup in MOS (metal oxide semiconductors) devices. Technical report.** Krantz, R.J.; Zietlow, T.C. Aerospace Corp., El Segundo, CA (USA). Electronics Research Lab. 31 Jan 1989. 27p. (TR-0089(4925-07)-1). Available from NTIS, PC A03/MF A01.

A rate equation for charge buildup, which includes sweep-out, hole /electron trapping, tunneling, recombination, and the effects of internal fields, is generalized to apply to negative gate biases and include electron injection from the silicon and aluminum gate interfaces. The dependence of the midgap voltage shift on oxide thickness is explicitly examined. The theoretical results are verified by comparison with experimental results obtained on p-type silicon test capacitors of different oxide thicknesses under varying positive and negative gate biases.

3223 (AD-A-210549/2/XAB) **Studies of high power density, pico-second rise-time light-activated semiconductor switch. Final report, 1 September 1987-31 December 1988.** Yu, P.L. California Univ., San Diego, La Jolla, CA (USA). Dept. of Electrical Engineering and Computer Sciences. 31 Dec 1988. 107p. Available from NTIS, PC A06/MF A01.

The carrier dynamics of the diode which is related to its electrical power switching behaviors is investigated in this program. A model is developed where the carrier transport and Maxwell equations are incorporated and self-consistent electrical-field profiles, current density and carrier are obtained in the PIN diode. Both low- and high-level optical excitations as well as low and high applied bias situations can be described by this model. The transient behavior of the diode switch at different optical energy levels is now well understood, while conventional theory for photodiodes at low-level excitation and at low bias cannot be applied to cases for high-level excitation and high bias. As a circuit element, the rise time of the switch under these circumstances depends on the time the internal field is cancelled out by mobile carriers generated. The predicted input-energy dependence and the transmission line impedance dependence of the rise time compare well with experimental results. The model also suggests the experimental configuration for obtaining power in the GW range. Finally, a preliminary investigation is made on the effects of avalanche multiplication on the performance of the diode switch.

3224 (DOE/BP/23169-2) **Adjustable speed drive study, June 1985-September 1988: Part 2, Appendices.** Wallace, A. Oregon State Univ., Corvallis, OR (USA). Dept. of Electrical and Computer Engineering. Aug 1989. 230p. Sponsored by U.S. DOE Management & Administration. DOE Contract AI79-85BP23169. Order Number DE90002771. Available from NTIS, PC A11/MF A01 - OSTI.

Advances in speed control for motors in recent years, notably those in power electronics, have widened the range of application for several adjustable speed drive (ASD) types to include the smaller horsepower sizes. The DC motor drive, formerly in almost universal use for speed control, is being challenged by the high efficiency induction motor/pulse width modulation (PWM) drive; and for special small horsepower size applications, by the permanent magnet motor/PWM inverter drive or by the switched reluctance motor drive. The main characteristics of the several ASD types suitable for small horsepower size applications are discussed, as well as their unwanted side effects: poor power factor, harmonic distortion of the supply, acoustic noise, and electromagnetic interference. A procedure is recommended for determining which, if any, ASD to use.

3225 (DOE/CE/34002-1) **Large signal nonlinear model of anisotropic transformers for nonsinusoidal operation: Final report, July 1, 1986-March 30, 1989.** Fuchs, E.F.; Masoum, M.A.S. Colorado Univ., Boulder, CO (USA). Sep 1989. 211p. Sponsored by U.S. DOE Conservation & Renewable Energy; National Science Foundation. DOE Contract FG02-86CE34002. ECS-8813405. Order Number DE90003259. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

Single-phase, nonlinear, transformers with anisotropic iron cores are modeled for (non)sinusoidal excitations and (non)linear loads. The λ-i characteristics are computed based on design data through a quasi three-dimensional magnetic field analysis. This analysis includes the effects of the interlamination and butt-to-butt air gaps, the exchange of flux between any two neighboring anisotropic laminations and the influences of the end windings. It is shown that the B-H characteristics of cross- and with-grain iron core samples, obtained from Epstein measurements, must be modified for their application to anisotropic iron-cores. Therefore, these characteristics are used to compute through a quasi three-dimensional magnetic field analysis appropriate B-H characteristics for anisotropic iron core samples. Based on such newly defined B-H characteristics the λ-i functions representing the saturation-dependent leakage inductances are calculated from design data. 17 refs., 136 figs., 24 tabs.

3226 (SAND-89-0500) **Cure analysis of printed-circuit boards containing reactive adhesive layers.** Fullerton, R.; Roylance, D.K.; Allred, R.E.; Smith, A.E. Sandia National Labs., Albuquerque, NM (USA). Oct 1989. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC04-76DP00789. Order Number DE90001800. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report presents a method for analyzing the cure of multilayer printed-circuit (PC) boards containing chemically reactive adhesive inner layers. The cure kinetics of the adhesive are first measured by differential scanning calorimetry, using the method of Freeman and Carroll to obtain the numerical kinetic parameters. These parameters are then used in a finite-element model of the PC board that simultaneously solves the heat- and species-transfer equations. It is then possible to predict the temperature and extent of reaction at any time and position within the laminate, enabling the curing program to be optimized. 19 refs., 6 figs.

3227 (SAND-89-2542C) **Microwave coupling phenomenology of pc [printed-circuit] boards.** Bacon, L.D.; Riley, D.J.; Toth, R.P. Sandia National Labs., Albuquerque, NM (USA). 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-891097-1: High powered microwave and broadband radio frequency propagation/phenomenology/methodology workshop, Livermore, CA (USA), 23-26 Oct 1989). Order Number DE90002576. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The final link in the High-Power Microwave (HPM) coupling chain is the distribution of energy on printed-circuit (pc) boards. This distribution is a critical part of the total problem, because the bottom line for damage or upset is what occurs at the component level. Like ports-of-entry (POE's), board coupling paths have their own transfer functions. Since most pc boards are not designed to operate at microwave frequencies, these transfer functions can be very complicated. In addition, active elements on the board are likely to make this part of the problem non-linear. 3 refs., 5 figs.

3228 **The radiation-hardened integrated circuit (RHIC) laboratory: Pursuit of Class 1. .** DeWitte, M.D. (Sandia National Labs., Albuquerque, NM (USA)). pp. 707 of Proceedings of the 9th international symposium on contamination control. International Environmental Sciences, Mt. Prospect, IL (1988). (CONF-880933-: 9. annual international symposium on contamination control: exploring world partnerships in technology, Los Angeles, CA (USA), 26-30 Sep 1988).

The Radiation-Hardened Integrated Circuit (RHIC) Laboratory is a research and development facility operated by Sandia National Laboratories for the Department of Energy. The facility is operated by the Center for Radiation-Hardened Microelectronics (CRM) and supports government clients with the rapid development and pilot production of radiation - hardened ULSI microelectronics. More than 25 years after Sandia's Willis Whitfield invented the first vertical

laminar flow clean room, Sandia National Laboratories has once again taken the lead in clean room technology with the design and construction of the RHIC facility. The building was designed to support wafer fabrication of ULSI integrated circuits through the 1990's. The facility consists of 12,000 s.f. (net) Ultra-Clean Room in a bay and chase configurations. The 174,000 s.f. building houses the majority of the Sandia CRM with 62,000 s.f. dedicated to office and light laboratory, 46,000 s.f. allocated for the clean room bay, chase and equipment repair/service area with the remaining 66,000 s.f. required for central plant and process support space.

3229 **The architectural ergonomics of Sandia's RHIC-II growing facility.** Miller, D.P. (Sandia National Labs., Albuquerque, NM (USA)). pp. 707 of Proceedings of the 9th international symposium on contamination control. Institute of Environmental Sciences, Mt. Prospect, IL (1988). (CONF-880933–: 9. annual international symposium on contamination control: exploring world partnerships in technology, Los Angeles, CA (USA), 26-30 Sep 1988).

Sandia National Laboratories is putting the finishing touches on its $26-million Radiation Hardened Integrated Circuits (RHIC-II) facility, and beginning to occupy the 5853 sq. meter (63,000 sq. ft.) light lab and office wing of the complex. During the next few months (March-July 1988), Sandia and its contractors will begin to occupy the heavy-lab wing, approximately 2973 sq. meters of which 1161 sq. meters is Class 10 clean room. Once fully occupied and operating, three shifts of approximately 45 process technicians will be working in the clean room. In order to maintain a Class-10 environment, clean room technicians will be required to wear special uniforms that filter the air exhaled by the wearer before passing it back into the clean room environment. This paper describes the uniforms and associated equipment, the gowning sequence, and the facility designed to accommodate convenient, contamination-free gowning.

3230 **Spectroscopic determination of the electrostatic potential profile in a plasma-prefilled ion diode.** Coleman, M.D. (Laboratory of Plasma Studies, Cornell University, Ithaca, New York 14853 (US)); Hammer, D.A. *Applied Physics Letters (USA),* 55(16): 1627-1629 (16 Oct 1989).

The electrostatic potential profile in the accelerating gap in a plasma-prefilled magnetically insulated intense pulsed ion beam diode has been determined using laser-induced fluorescence spectroscopy. Results for a 300–400 kV planar diode are presented, both with and without an electron emitting vane protruding from the cathode. In both cases, a 5–6 mm accelerating gap forms in the 10^{12}–10^{13}/cm^3 plasma in a few nanoseconds. The experimental potential profiles are not consistent with electrons confined to a sheath near the cathode. Rather, electrons are required throughout the gap to explain the observations.

3231 **Evaluation of a linear photodiode array detector for synchrotron small-angle x-ray scattering measurements.** Chu, B. (Department of Chemistry, State University of New York at Stony Brook, Stony Brook, New York 11794-3400 (US)); Wu, D.Q.; Howard, R.L. *Review of Scientific Instruments (USA),* 60(10): 3224-3230 (Oct 1989).

A linear photodiode array position-sensitive detector for synchrotron small-angle x-ray scattering was constructed by coupling a fiber-optic face plate coated with a thin layer (~40 μm) of phosphor (Y_2O_2S:Tb) onto an electrostatically focused, intensified photodiode array detector (EG&G, PARC, Model 1422) originally designed for visible light applications. The x-ray detector was thoroughly evaluated. It showed excellent linearity of response to the incident x-ray intensity (less than 1%), stable pixel uniformity (an average of ±5%), good spatial linearity (±1 per 100 pixels), and a net gain of ~17 counts/x-ray photon at 8 keV. The detector quantum efficiency was about 1 for a signal-to-noise ratio of greater than ~5%. No damage to individual pixels was found after exposure to a main beam of ~10^{10} x-ray photons/mm^2/s. A finite afterglow ($\gtrsim$5 s) was observed for the phosphor inside the intensifier tube. The afterglow that could limit fast time-resolved experiments could be significantly improved by replacing the present intensifier with one using a fast-decay phosphor. The detector usable length could be increased from the present 25 to 50 mm by replacing the fiber-optic face plate with a 2:1 taper.

3232 **Broadband cryogenic preamplifiers incorporating GaAs MESFETs for use with low-temperature particle detectors.** Lee, A.T. (Physics Department, Stanford University, Stanford, California 94305 (US)). *Review of Scientific Instruments (USA),* 60(10): 3315-3322 (Oct 1989).

Two voltage-sensitive preamplifier designs are presented for operation at 1.6 K. Both designs incorporate GaAs MESFETs (Plessy P35-1101). The first design has two stages including a common-source gain stage and a source follower stage. The noise performance, particularly with the low-frequency noise, was found to improve with cooling. The white-noise level at low temperature is 1 nV/Hz$^{1/2}$, and the low-frequency noise corner occurs at approximately 1 MHz. The voltage gain into 50 Ω is 7.0 dB, with the −3-dB point occuring at 10 MHz. The noise of the first stage was found to dominate the total noise at the output of a low-noise room-temperature post amplifier. The output impedance of the preamplifier is 50 Ω. The second design incorporates one cold FET, dissipating 1 mW, in cascode with a room-temperature bipolar transistor. The noise of this design was found to be approximately equal to that of the two-cold-stage design except for a bulge in the voltage noise centered at 13 MHz due to impedance mismatching of the line to room temperature. The gain of this design is 21 dB, with the −3-dB point at 2 MHz. Cryogenic semiconductor operation is discussed, design parameters of the two preamplifiers are discussed in detail, noise measurements are presented along with a discussion of the different temperature- and bias-dependent noise sources, and an analysis of the signal-to-noise ratio and rise time for the present detection scheme is made.

3233 **Niobium and niobium nitride contacts on semiconducting material.** Cukauskas, E.; Carter, W.; Pond, J.; Newman, H. To Department of the Navy, Washington, DC (USA). USA Patent Application 7-374,101. 30 Jun 1989. 19p. Available from NTIS, PC A03/MF A01.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

This invention related generally to a metallization layer of niobium or niobium nitride on a semiconductor in an integrated-circuit structure, which can function from the superconducting-temperature regime to above room temperature. Niobium or niobium nitride is deposited onto a heated gallium arsenide substrate. This metallization will maintain chemical stability after high-temperature post processing. These materials provide a low-resistivity metallization suitable for Schottky contacts used over a wide operating temperature range and are superconducting at low temperatures.

3234 (PB–89-222806/XAB) **Hybrid knowledge-based/algorithmic approach to the design of waste-treatment systems.** Rossman, L.A. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. 1989. 11p. (EPA–600/D-89/096). Available from NTIS, PC A03/MF A01.

Synthesizing a waste-water treatment system design involves selecting the combination, arrangement, and sizing of unit-treatment processes that will meet all treatment objectives. A computer-based method for the initial phase of treatment-system design is developed. It identifies arrangements of alternative unit processes whose overall performance index falls within a specified limit. The problem is approached using the artificial-intelligence paradigm of algorithmic state space search guided by knowledge-based heuristics. An experimental PROLOG program illustrates how the method may be implemented for a wide variety of waste-water-treatment design problems.

3235 (ETDE-mf–0718075) **Determination of compatibility conditions of the burner/boiler system of heating equipment**

with a view to energy conservation by means of optimum adjustment of components. Final report. Pt. 3. Investigations of pressure swings in the starting process in a burner/boiler system. Melke, J.; Thomassen, S. Technischer Ueberwachungs-Verien Rheinland e.V., Koeln (Germany, F.R.). Inst. fuer Energietechnik und Umweltschutz; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). 1987. 79p. (In German). BMFT 03E-8339A/7. Order Number DE90718075. Available from NTIS (US Sales Only), PC A05/MF A01.

The starting behaviour of a burner/boiler combination is to be considered from the aspect of energy saving and the reduction of harmful substances. Unburnt hydrocarbons and soot are produced in the ignition phase, so that the efficiency gradually drops due to deposits in the boiler. The aim of the investigation was to determine the relevant burner and boiler properties for the starting behaviour by measuring the pressure swings. Previous work of other authors, in which burner and boiler characteristics were defined was to be consulted. However, this preliminary invesigation showed that these figures do not apply clearly to burners or boilers. It is proposed that the method should be checked and possibly supplemented by new methods. 3236 (N–89-17298) **Turbine Engine Hot Section Technology, 1987.** National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. 464p. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). Available from NTIS, PC A20/MF A01.

Presentations were made concerning the development of design analysis tools for combustor liners, turbine vanes, and turbine blades. Presentations were divided into six sections: instrumentation, combustion, turbine heat transfer, structural analysis, fatigue and fracture, surface protective coatings, constitutive behavior of materials, stress-strain response and life prediction methods.

3237 (N–89-17298, pp. 239-240) **Three-dimensional inelastic analysis methods for hot section components.** Todd, E.S. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objective of this program is to produce a series of new computer codes that permit more accurate and efficient three-dimensional inelastic structural analysis of combustor liners, turbine blades, and turbine vanes. Each code embodies a progression of mathematical models for increasingly comprehensive representation of the geometrical features, loading conditions, and forms of nonlinear material response that distinguish these three groups of hot section components.

3238 (N–89-17298, pp. 241-248) **Three-dimensional inelastic analysis for hot section components, BEST 3D code.** Wilson, R.B. (State Univ. of New York, Buffalo (USA)); Banerjee, P.K. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The goal is the development of an alternative stress analysis tool, distinct from the finite element method, applicable to the engineering analysis of gas turbine engine structures. The boundary element method was selected for this development effort on the basis of its already demonstrated applicability to a variety of geometries and problem types characteristic of gas turbine engine components. Major features of the BEST3D computer program are described, and some of the significant developments carried out as part of the Inelastic Methods Contract are outlined.

3239 (N–89-17298, pp. 249-254) **Response characteristics of MHOST (MARC Hot-Section Technology) for 3-D inelastic analysis of hot-section components.** Shen, L.K. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The advantages of a newly developed code are demonstrated by comparisons of the analysis with existing theoretical data as well as with other available finite element programs. The new program shows promise to significantly reduce the computer time. It also permits accurate and efficient structural analysis of engine hot section components.

3240 (N–89-17298, pp. 255-257) **Mechanics of materials model.** Meister, J.P. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The Mechanics of Materials Model (MOMM) is a three-dimensional inelastic structural analysis code for use as an early design stage tool for hot section components. MOMM is a stiffness method finite element code that uses a network of beams to characterize component behavior. The MOMM contains three material models to account for inelastic material behavior. These include the simplified material model, which assumes a bilinear stress-strain response; the state-of-the-art model, which utilizes the classical elastic-plastic-creep strain decomposition; and Walker's viscoplastic model, which accounts for the interaction between creep and plasticity that occurs under cyclic loading conditions.

3241 (N–89-17298, pp. 259-265) **Component specific modeling.** Mcknight, R.L.; Tipton, M.T. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objective was to develop and verify a series of interdisciplinary modeling and analysis techniques specialized to address hot section components. These techniques incorporate data as well as theoretical methods from many diverse areas, including cycle and performance analysis, heat transfer analysis, linear and nonlinear stress analysis, and mission analysis.

3242 (N–89-17298, pp. 267-271) **Three-dimensional inelastic analysis methods for hot section components.** Lackney, J. (Sverdrup Technology, Inc., Cleveland, OH (USA)); Chamis, C.C. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objective was to develop analytical methods capable of evaluating the cyclic time dependent inelasticity which occurs in hot section engine components. Because of the large excursions in temperature associated with hot section engine components, the techniques developed must be able to accommodate large variations in material behavior including plasticity and creep. To meet this objective, a matrix consisting of three constitutive mode-element formulations was developed. A separate program for each combination of constitutive mode-element model was written. The source codes of the nine programs range in size from 7300 lines for the Bodner/twenty code to 19,000 lines for the Haisler and Allen/nine code. All the codes were given a stand alone capability of performing cyclic nonlinear analysis.

3243 (N–89-17298, pp. 273-279) **Constitutive modeling for isotropic materials.** Lindholm, U.S.; Chan, K.S. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The fourth and final year of the HOST project with the initial objective of developing a unified constitutive model for finite element structural analysis of turbine engine hot section components is discussed. The final year's work was primarily concerned with the study of nonisothermal problems and the potential for thermal history effects to occur explicitly in the constitutive equations.

3244 (N–89-17298, pp. 335-348) **Finite element implementation of viscoplastic models.** Arya, V.K. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

A brief description of the implementation in MARK, the general purpose finite element structural analysis code, of two viscoplastic models developed by Robinson is given. One model is for isotropic materials and the other is for metal matrix composites. Also presented are analytical results obtained for hot section components using these models.

3245 (N–89-17298, pp. 349-356) **Structural response of an advanced combustor liner: Test and analysis.** Moorhead, P.E. (Sverdrup Technology, Inc., Cleveland, OH (USA)); Thompson, R.L.; Tong, M.; Higgins, M. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

An advanced (segmented) combustor liner supplied by Pratt and Whitney Aircraft was tested in the structural component test rig at Lewis Research Center. It was found that the segmented liner operated at much lower temperatures than the conventional liner (about 400 F lower) for the same heat flux. At the lower temperatures and low thermal gradients, little distortion to the segments was observed. The operating conditions were not severe enough to distort or damage the segmented liner.

3246 (N–89-17298, pp. 413-422) **Elevated temperature crack growth.** Kim, K.S.; Vanstone, R.H.; Malik, S.N.; Laflen, J.H. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The purpose is to determine the ability of currently available P-I integrals to correlate fatigue crack propagation under conditions that simulate the turbojet engine combustor liner environment. The utility of advanced fracture mechanics measurements will also be evaluated. Research showed that the experimentally measured displacements and loads can be accurately predicted by finite element analyses that consider the growth of the fatigue crack. These results are being used to evaluate nonlinear fracture mechanics parameters for correlating the observed fatigue crack growth rates for different strain ranges.

3247 (N–89-17298, pp. 423-434) **Creep fatigue life prediction for engine hot section materials (ISOTROPIC) fifth year progress review.** Nelson, R.S.; Harvey, P.R. National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The need for advanced life prediction methods for hot section components for gas turbine engines is becoming more and more evident. The complex local strain and temperature histories at critical locations must be accurately interpreted to account for the effects of various damage mechanisms and their possible interactions. This program is designed to investigate these fundamental damage processes, identify modeling strategies, and develop practical models which can be used to guide the early design and development of new engines and to increase the durability of existing engines.

3248 (N–89-28030) **Probabilistic structural analysis methods of hot engine structures.** Chamis, C.C.; Hopkins, D.A. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Jun 1989. 17p. (NASA-TM–102091;E–4855;NAS–1.15:102091;CONF-890612–: 34. international gas turbine and aeroengine congress and exposition, Toronto (Canada), 4-8 Jun 1989). Available from NTIS, PC A03/MF A01.

Development of probabilistic structural analysis methods for hot engine structures at Lewis Research Center is presented. Three elements of the research program are: (1) composite load spectra methodology; (2) probabilistic structural analysis methodology; and (3) probabilistic structural analysis application. Recent progress includes: (1) quantification of the effects of uncertainties for several variables on high pressure fuel turbopump (HPFT) turbine blade temperature, pressure, and torque of the space shuttle main engine (SSME); (2) the evaluation of the cumulative distribution function for various structural response variables based on assumed uncertainties in primitive structural variables; and (3) evaluation of the failure probability. Collectively, the results demonstrate that the structural durability of hot engine structural components can be effectively evaluated in a formal probabilistic/reliability framework.

3249 (PB–89-218242/XAB) **Recent developments of emission control technology in the United States for fossil fuel combustion sources.** Drehmel, D.C.; Sedman, C.B. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1989. 27p. (EPA–600/D-89/025). Available from NTIS, PC A03/MF A01.

This paper discusses control of air pollution from fossil-fuel combustion. Until recently, this meant abatement of smoke (particulate), sulfur dioxide, and oxides of nitrogen. With growing concern about global climate change, carbon dioxide has been added to the list. The paper includes discussions of such controls and control systems as wet and dry scrubbers, fabric filters, electrostatic precipitators, physical coal cleaning, flue-gas desulfurization, selective catalytic reduction, limestone-injection multistage burners, reburning, E-SOx and ADVACATE.

3250 (STEV-FBT–89-24) **Effect of reductive decomposition of $CaSO_4$ on sulphur capture in fluidised bed boilers.** Lyngfelt, A.; Leckner, B. Statens Energiverk, Stockholm (Sweden). 1989. 11p. (CONF-890402–8: 10. international conference on fluidized-bed combustion, San Francisco, CA (USA), 30 Apr - 3 may 1989). Order Number DE90719434. Available from NTIS (US Sales Only), PC A03.

The effect of limestone addition on sulphur capture and NO emissions has been studied in a stationary and a circulating fluidised bed boiler (FBB). Significant differences between the two boilers were observed, both with respect to sulphur capture and NO emission behaviour. In the stationary FBB sulphur retention exhibits a strong temperature dependence as opposed to the circulating FBB. Furthermore the sulphur capture performance is much more effective in the circulating FBB. In the circulating FBB limestone addition resulted in a considerable increase of NO emission, whereas no effect of limestone was seen in the stationary FBB for the same type of coal. For a low volatile fuel, however, limestone addition gave a considerable decrease of NO emission in the stationary FBB. These results can be explained by the sorbent particles being exposed to reducing conditions in the particle phase of the stationary FBB. (orig.) 21 refs., 9 illustrations.

3251 (VTT-TIED–944) **Qualitative modeling and control of combustion.** Lilja, R.; Oliut, M.; Heinonen, R. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Feb 1989. 50p. (In Finnish). Order Number DE90719342. Available from NTIS (US Sales Only), PC A03/MF A01.

The increasing use of fossil fuels with more restrictive emission limits have created the need to improve the control process in combustion chambers. This report presents the background data of the opportunities for improving combustion control by using in a new way numerical simulation, knowledge technique, picture information taken with a furnace camera and new control algorithms.

3252 (VTT-TIED–985) **Electricity production at fuel cell power plants.** Leppaelahti, J. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). May 1989. 73p. (In Finnish). Order Number

A report of the NEMO-Research Program.

The essentially higher efficiency of electricity production is the most significant advantage of the fuel cell power plant compared to the conventional power plants. The maximum efficiency obtained in techno-economic estimates has been about 55%. The operation of the fuel cell power plant requires the feed of clean fuel gas into the fuel cell. As a consequence of this and of the character of the oxidation reaction, the flue gas emissions from this power plant type are very low. However, a number of technicca problems should be solved until a large-scale fuel cell power plant can be constructed. The maximum total efficiency of electricity production can be achieved only at power plants based on fuel cells operable at high temperatures. The advancement of these cell types to a commercial level will, however, require a lot of technical development. It is expected that cell types operable at low temperatures and suited for power plants will be introduced into the market during the next few years. Due to the low operation temperature, the waste heat developed by these is more difficult to utilize than that of the fuel cells operating at high temperatures, and hence, the efficiency of these power plants will remain lower. The fuel cell power plant also requires the development of fuel processing methods. Requirements of new type will be set on gasification processes of solid fuels and on gas clean-up. The processing of natural gas for fuel cells should also be developed.

3253 (VTT-TUTK–990) **Sonic pyrometry in furnaces. Fundamentals.** Martikainen, P. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). 1989. 80p. (In Finnish). Order Number DE90719335. Available from NTIS (US Sales Only), PC A05/MF A01.

A research report of the Liekki-research program.

Mean gas temperature measurement between a transmitter and a receiver can be based on propagation velocity of sound waves. To use this measurement technique, molecular weight and specific heat ratio data of the intermediate gas must be known. At applications in dilute suspensions some modifications of these parameters can be utilized. In the presence suspended particles, oxidizing soot particles and chemical reactions, sound velocity depends on frequency. At furnace temperature measurements the frequency range about 0.5-3 kHz is mostly utilized. Usually six to eight transceivers are installed on the perimeter of a furnace. A temperature distribution of the measurement plane can be constructed on the basis of single travel times and corresponding mean temperatures between acoustic transducers. The acoustic measurements have a rather good agreement with water-cooled high velocity thermocouple probes. An acoustic pulse of high sound pressure level is generated with an electromagnetic transducer or with an electric discharge across a pair of electrodes. Utilizing an electrodynamic transducer the acoustic pulse is more controllable, e.g. chirp pulse compression is possible.

3254 (PB–89-218481/XAB) **Liquefaction hazards and their effects on buried pipelines. Technical report.** O'Rourke, T.D.; Lane, P.A. National Center for Earthquake Engineering Research, Buffalo, NY (USA). 1 Feb 1989. 197p. (NCEER–89-0007). Available from NTIS, PC A09/MF A01.

This research involves the evaluation of liquefaction-induced ground movements and their effects on buried pipelines. The work is divided into three components: review of liquefaction phenomena and associated ground displacements; characterization of liquefaction-induced lateral spreading through observations and measurements of lateral spread deformations during past earthquakes; parametric study to evaluate buried pipeline response as a function of soil properties and geometric characteristics of lateral spreads. Case studies of four earthquakes were reviewed in which occurrences of lateral spreading have been reported. The results of the case studies indicate a close relationship between geologic and morphologic conditions and the occurrence and pattern of lateral spreading. The parametric study demonstrates the strong influence of geometric characteristics of the soil displacements on buried pipeline response. The delineation of zones of potentially large ground movement and the estimation of displacement patterns can be useful in the design of future pipeline systems, and the modification of existing ones, to limit earthquake damage.

3255 (AUC-IBT-R–8722) **Applications of structural systems reliability theory in offshore engineering. State-of-the-art.** Structural Reliability Theory. Paper, 35. Thoft-Christensen, P. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Sep 1987. 25p. (CONF-8709477–: International symposium on integrity of offshore structures, Glasgow (UK), Sep 1987). Available from Available on loan from Risoe Library, DK-4000 Roskilde.

Structural Reliability Theory. Paper, 35.

In this paper the latest developments in structural systems reliability are reviewed and discussed from the point of view of application in offshore engineering. It is concluded that structural systems reliability is now developed to such a level that some applications in offshore engineering are possible. However, more research is needed before extensive use can be expected. (author) 18 refs.

3256 (PB–89-222681/XAB) **Quantitative evaluation of air-filtration systems in use at asbestos abatement sites: Research in progress.** Powers, T.J.; Cain, W.C.; Wilmoth, R.C.; Kominsky, J.R.; Brownlee, J.A. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. 1989. 17p. (EPA–600/D-89/056). Available from NTIS, PC A03/MF A01.

High Efficiency Particulate Air (HEPA) filtration systems serve as the principal engineering control to remove asbestos particulate from airstreams at abatement projects. However, little quantitative information is available on the integrity of these air-filtration systems in preventing asbestos fiber release into outdoor air or adjacent building areas, potentially exposing occupants. A study is in progress to assess the performance of HEPA filtration systems in use at asbestos abatement projects to determine each systems operating particle-removal efficiency, percent concentration, and decontamination factor. The asbestos-fiber concentration in the inlet and discharge air of each filtration system will be determined by isokinetic air sampling. Each isokinetic air sample collected will be analyzed using transmission electron microscopy. In addition, in-place aerosol performance testing will be conducted according to procedures outlined in ANSI/ASME N510-1980. The test method utilizes a polydispersed dioctyl phthalate aerosol (generated by Laskin nozzles) and a photometric light-scattering mass-concentration detector as the measuring device.

3257 (PB–89-235899/XAB) **Method for measuring the effectiveness of gaseous-contaminant removal filters.** Mahajan, B.M. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Building Environment Div. Aug 1989. 54p. (NISTIR–89/4119). Available from NTIS, PC A04/MF A01.

See also PB–88-155882.

The report presents a brief review of the gas-adsorption kinetics theory applicable to adsorption of gaseous contaminants by filter media, and an algorithm for assessing the effectiveness of filtering devices with flow bypass. It briefly describes the selected testing technique for measuring the effectiveness of filter media, and presents experimental data for adsorption of n-butane, toluene, and carbon monoxide.

Oct 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE90003260. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Lecture for Goudsmit Professorship, University of Michigan, October 11, 1989.

In this lecture I would like to trace how high energy particle accelerators have grown from tools used for esoteric small-scale experiments to gigantic projects being hotly debated in Congress as well as in the scientific community.

3259 (LBL–27000) **Accelerator and Fusion Research Division: 1988 summary of activities.** Lawrence Berkeley Lab., CA (USA). May 1989. 124p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90002618. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The Accelerator and Fusion Research Division is not only the largest scientific division at LBL, but also one of the most diverse. Major efforts include: investigation in both magnetic and inertial-confinement fusion; design and construction of the Advanced Light Source, a state-of-the-art synchrotron-radiation facility; research into advanced applications and instrumentation at the Center for X-Ray Optics; theoretical studies of accelerator phenomena and characteristics; research and development in support of the Superconducting Super Collider and other high-energy accelerators; operation of a large accelerator complex, the Bevalac, for nuclear science and biomedical research. Research in these areas is summarized in this report.

The hadron collider physics program at Fermilab, Tevatron-I, has recently provided considerable data samples to two high beta experiments as well as one low beta general purpose Collider Detector at Fermilab (CDF). A brief description of the Tevatron collider and the high beta experiments is followed by a discussion of hard scattering results from CDF. The prospects for growth in this exciting physics program are outlined. 20 refs., 29 figs., 1 tab.

3261 (BNL–43281) **High energy heavy ion collisions and the RHIC [Relativistic Heavy Ion Collider] project at Brookhaven.** Ludlam, T.W. Brookhaven National Lab., Upton, NY (USA). [1989]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8905143–20: NATO advanced study institute international advanced course on the nuclear equation of state, Peniscola (Spain), 12 May - 3 jun 1989). Order Number DE90002293. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The most spectacular of the new high energy approaches to nuclear physics is the field of relativistic heavy ion collisions, for which it is anticipated that construction of the Relativistic Heavy Ion Collider (RHIC) facility will begin soon. Here the goal is to subject large volumes of nuclear matter to such extreme conditions of temperature and pressure that a new form of matter is produced in which the recognizable components are not the familiar neutrons and protons, but are quarks. This paper discusses the RHIC project of the experiments and detectors associated with it. 10 refs., 4 figs.

3262 (IC–89/170) **Wakefield accelerator in a magnetized electron-positron plasma.** Mofiz, U.A. International Centre for Theoretical Physics, Trieste (Italy). Jul 1989. 7p. Order Number DE90608630. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

A short pulse of intense electromagnetic radiation may excite large amplitude wakefields (E>1 Gev/m) in a magnetized electron-positron plasma and consequently, electron or positron bunches may be accelerated to high energies. Such a mechanism exists in the pulsar magnetosphere and its realization in the laboratory may accomplish the promising method for the generation of high energy accelerators. (author). 12 refs.

3263 (INIS-mf–12013, pp. 1-6) **Tandem accelerators.** Duerr, W.; Heck, R.; Horn, K.; Jaeschke, E.; Kandler, H.; Kraemer, D.; Koessler, V.; Pfahler, R.; Repnow, R.; Schmidt, H. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

At the EN accelerator the demand for voltages higher than 3 MV was decreased. For long periods of time the machine was operated with reduced gas pressure to allow corona regulation down to terminal voltages less than 200 kV. However, the charging belt had to be replaced, which had been in service for 14000 hours. The performance of prototypes of D-type resistors installed in the EN-column was highly satisfying. The conductive drive sheaves of the pelletron of the MP-tandem-accelerator had to be removed before operational experience could be gathered because of warnings received from the manufacturer. Tube section no. 5 was replaced after 40000 hours of operation after a fissure was discovered in a glass insulator. Internal tracks due to electrical discharges were discovered across two other tube insulators, which had to be shorted out. The failure of a tooth belt in the rotating shaft system caused an additional tank opening, and an overheated high voltage bushing of the ICT caused some additional down-time of the MP. Two additional column sections were equipped with D-type grading resistors of the Strasbourg-design. Six new ion species - mainly rare earth isotopes - were provided for experiments. The high current sputter source MISS was further improved, especially with respect to pulsed mode operation. Consequently a beam with a peak electrical current of 240 μA ^{16}O was analyzed behind the MP during a source test experiment. (orig.).

3264 (LBL–27001) **Center for X-ray Optics, 1988.** Lawrence Berkeley Lab., CA (USA). Apr 1989. 24p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. F49620-87-K-0001. Order Number DE90003300. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This report briefly reviews the following topics: soft-x-ray imaging; reflective optics for hard x-rays; coherent XUV sources; spectroscopy with x-rays; detectors for coronary artery imaging; synchrotron-radiation optics; and support for the advanced light source.

3265 (LBL–27649) **The challenges of third-generation synchrotron light source.** Jackson, A. Lawrence Berkeley Lab., CA (USA). Aug 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (ESG–78;CONF-890803–37: International conference on high energy accelerators, Tsukuba (Japan), 20-26 Aug 1989). Order Number DE90002461. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Third-generation synchrotron light sources are specifically designed to operate with long insertion devices that produce very high brightness beams of synchrotron radiation. There are many such facilities now under construction, or in the design stage, all over the world. After a brief review of the main properties of the low emittance storage rings that form the heart of these facilities, we will discuss the particular challenges that accompany their design. These include: the effects of the strong sextupoles required for chromatic correction of the low emittance lattices; impact of machine imperfections on the dynamic aperture; the effects of the linear and nonlinear magnetic fields of the undulators; impedance consequences of long, narrow, undulator vacuum vessels; injection; and beam lifetime. As examples, we take the Advanced Light Source, currently under construction at the Lawrence Berkeley Laboratory, USA, and the European Synchrotron Radiation Facility under construction in Grenoble, France. 8 refs., 8 figs., 1 tab.

3266 (LBL–27763) **Challenges for utilization of the new synchrotron facilities.** Attwood, D. Lawrence Berkeley Lab., CA (USA). Aug 1989. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890802–16: 7. synchrotron radiation instrumentation (SRI) national conference,

Berkeley, CA (USA), 6-10 Aug 1989). Order Number DE90002451. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The emergence of third generation synchrotron radiation facilities provides new scientific opportunities and challenges. Optimized for small phase space electron beams, long periodic magnet structures, and dedicated scientific user access – these new machines promise significant increases in spectral brightness, as well as enhanced spatial and temporal coherence properties, which translates to new opportunities for combining high spatial and spectral resolution. The challenges to the machine builders are well known: designing and maintaining the small phase space beams, constructing long magnet structures with minimal errors, stabilizing the beam to long and short term fluctuations, and multiple undulator tuning, to name a few. The challenges in beamline optics, spectroscopic and focusing systems are also quite clear. The issue of optical stability quickly comes to the forefront as we attempt to focus and image to ever finer spatial scales, with minimal loss of photon flux. Surface figure and polish are of greater importance, as is minimization of aberrations, as we strive to maintain these small phase space photon beams. The higher intensities and power loading mandate cooled, or cleverly controlled optics, to avoid thermal distortion. Spectroscopic efficiency, with minimal wavefront distortion to the near diffraction limited radiation, becomes more important, as do order and harmonic suppression resolution are called for – with both diffractive and reflective optics. Two of our major issues will be efficient time sharing of these valuable resources, relegating time consuming setup procedures to branch lines while others take data, and controlling the cost of these ever more complex beamline engineering systems. 12 refs., 6 figs., 8 tabs.

3267 (UCRL–101915) **Induction linear accelerators for commercial photon irradiation processing.** Matthews, S.M. Lawrence Livermore National Lab., CA (USA). 13 Jan 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890604–20: Annual meeting of the American Nuclear Society, Atlanta, GA (USA), 4-8 Jun 1989). Order Number DE90002975. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A number of proposed irradiation processes requires bulk rather than surface exposure with intense applications of ionizing radiation. Typical examples are irradiation of food packaged into pallet size containers, processing of sewer sludge for recycling as landfill and fertilizer, sterilization of prepackaged medical disposals, treatment of municipal water supplies for pathogen reduction, etc. Volumetric processing of dense, bulky products with ionizing radiation requires high energy photon sources because electrons are not penetrating enough to provide uniform bulk dose deposition in thick, dense samples. Induction Linear Accelerator (ILA) technology developed at the Lawrence Livermore National Laboratory promises to play a key role in providing solutions to this problem. This is discussed in this paper.

3268 **Operational experience with Tevatron I antiproton source.** McCarthy, J.D. (Fermi Nat. Lab., Batavia, IL (US)). pp. 2030 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S IEEE Service Center, Piscataway, NJ (1987). (CONF-870302–: Particle accelerator conference, Washington, DC (USA), 16-19 Mar 1987).

The Fermilab antiproton source consist of five beamlines, a targetting station and two storage rings. The beam is extracted fr the Main Ring at 120 GeV from F-17 and transported up AP-1. At AP-0 they are targetted on a 7cm copper (5cm) target. The antiprotons are collected at 8 GeV with a 15 cm long lithium lens of 1 cm radius operating at 800 T/m gradient.

3269 **Overview of recent focussing horns for the BNL neutrino program.** Carroll, A. (AGS Dept., Brookhaven National Lab., Upton, NY (US)); Leonhardt, W.; Monaghan, R.; Peason, C.; Pendzick, A.; Ryan, G.; Sandberg, J.; Sims, W.; Smith, G.; Stillman, P. pp. 2030 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. IEEE Service Center, Piscataway, NJ (1987). (CONF-870302–: Particle accelerator conference, Washington, DC (USA), 16-19 Mar 1987).

In this paper the authors present an overview of the two magnetic focussing horn systems recently constructed, installed, and operated in the fast extracted beam for the neutrino physics program at the AGS. These horn systems consist of a number of interrelated subsystems which operate together to produce a very intense, parallel beam of pions. Both horn systems built had the same overall features, but the broad band system focussed pions over as large a momentum band as possible to maximize the neutrino flux. A synopsis of the design concepts and critical engineering requirements is given.

Available from NTIS (US Sales Only), PC A10/MF A01.

The eigenvalues and eigenmodes of helical beam crystals in a simple harmonic focussing field have been calculated, applying the group theoretical approach of molecular physics, leading to a simple diagonalization of 3x3 matrices. (orig.).

3271 (LA-UR–89-3600) **The design and performance of the FNAL high-energy polarized beam facility.** Tanaka, Nobuyuki. E-581/704 Collaboration. Los Alamos National Lab., NM (USA). [1989]. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8910121–1: 6. topical conference on physics with polarized beams on polarized targets, Spencer, IN (USA), 16-18 Oct 1989). Order Number DE90002409. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We describe a new polarized-proton and -antiproton beam with 185-GeV/c momentum in the Fermilab MP beam line which is currently operational. The design uses the parity-conserving decay of lambda and antilambda hyperons to produce polarized protons and antiprotons, respectively. A beam-transport system minimizes depolarization effects and uses a set of 12 dipole magnets that rotate the beam-particle spin direction. A beam-tagging system determines the momentum and polarization of individual beam particles, allowing a selection of particles in definite intervals at momentum and polarization. We measured polarization of the beam by using two types of polarimeters, which verified the determination of polarization by a beam-particle tagging system. Two of these processes are the inverse-Primakoff effect and the Coulomb-nuclear interference (CNI) in elastic proton-proton scattering. Another experiment measured the π^0 production asymmetry of large-x_F values; this process may now be used as an on-line beam polarimeter. 9 refs., 9 figs.

3272 (LBL–27765) **A study of phase control in the FEL [free electron laser] two-beam accelerator.** Sessler, A.M.; Whittum, D.H.; Wurtele, J.S. Lawrence Berkeley Lab., CA (USA). Aug 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890803–38: International conference on high energy accelerators, Tsukuba (Japan), 20-26 Aug 1989). Order Number DE90002681. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A formalism is developed for the analysis of a steady-state free electron laser (FEL) and is applied to the two-beam accelerator (TBA). Conditions are derived for the design of a FEL TBA with rf output power and phase insensitive to errors in both beam current and energy. An example is presented of a suitably phase insensitive TBA design with 100 reaccelerations employing untapered FEL sections and with low power rf input to each section. The theoretical analysis is confirmed by a single particle FEL simulations. 9 refs., 2 tabs.

3273 (LBL–27766) **General properties of an asymmetric B-factory lattice.** Autin, B. Lawrence Berkeley Lab., CA (USA). Aug 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890803–41: International conference on high energy accelerators, Tsukuba (Japan), 20-26 Aug 1989). Order

Number DE90002678. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The type of collider considered for the production of B mesons consists of two rings in which unequal energy beams circulate. Criteria based on the beam-beam interaction are formulated and it is shown that they are consistent with lattices in which the synchrotron radiation occurs in the bending magnets only. However, the requirements imposed on the low energy ring dipole field and RF power may require the addition of horizontal wigglers in zero dispersion sections to control the damping time and of vertical wigglers in finite dispersion regions to adjust the shape of the beam at the crossing point. 9 refs., 1 fig.

3274 (SAND–89-2629C) **RLA simulations.** Wagner, J.S. Sandia National Labs., Albuquerque, NM (USA). [1989]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909216–8: DARPA/SDIO service annual charged particle beam review, Monterey, CA (USA), 18-21 Sep 1989). Order Number DE90002581. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Preliminary BUCKSHOT simulations of a recirculating linear accelerator have been made. Two accelerator configurations have been examined for a variety of beam currents (10-40 kA). The first configuration is an attempt to simulate conditions accessible to near-term experiments. The second configuration tries to mock up a next generation application type machine. 3 figs.

3275 (SAND–89-7141C) **Summary of RLA [Recirculating Linear Accelerator] beam transport experiments using a 1.5 MV injector.** Haworth, M.D.; Platt, R.C.; Smith, D.L.,; Mazarakis, M.G.; Poukey, J.W.; Leifeste, G.T.; Hasti, D.E.; Bennett, L.F.; Lucero, S.J. Sandia National Labs., Albuquerque, NM (USA). [1989]. 4p. Sponsored by U.S. Department of Defense; U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. 145-SNL-1-8-1;63-9595. (CONF-8909216–10: DARPA/SDIO service annual charged particle beam review, Monterey, CA (USA), 18-21 Sep 1989). Order Number DE90002583. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Beam transport experiments on Sandia's Recirculating Linear Accelerator (RLA) using a 1.5-MV injector with and without an additional 1.0 MV of acceleration provided by the ET-2 accelerating cavity were concluded this year. Our experimental results show that an injected beam of only 1.5 MeV requires too large an f-value in the IFR channel to effectively propagate a 10-kA beam. Dramatic improvement in current transport was seen for the higher-γ 2.5 MeV beam. Based on these results plus computer simulation results, the 4.0 MeV IBEX accelerator is now being used as the RLA injector. 10 refs., 7 figs.

3276 (SLAC/AP–76) **Optimizing the average longitudinal phase of the beam in the SLC linac.** Bane, K.L.F. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Sep 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. Order Number DE90002803. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The relation of the beam's average linac phase, ϕ_0, to the final energy spectrum in the SLC linac has been studied by many people over the years, with much of the work left unpublished. In this note we perform a somewhat thorough in vestigation of the problem. First we describe the calculation method, and discuss some common features of the energy spectrum. Then we calculate the value of ϕ_0 that minimizes δ_{rms} for the conceivable range of bunch population and bunch lengths of the SLC linac. This is followed by luminosity calculations, including the sensitivity of luminosity to variations in ϕ_0. Finally we suggest a practical method of implementing the proper phase setting on the real machine.

3277 (SLAC-PUB–5060) **An adiabatic focuser.** Chen, P.; Oide, K.; Sessler, A.M.; Yu, S.S. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515;AC03-76SF00098;W-7405-ENG-48. (LBL–27608;CONF-890803–40: International conference on high energy accelerators, Tsukuba (Japan), 20-26 Aug 1989). Order Number DE90001816. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Theoretical analysis is made of an intense relativistic electron beam, such as would be available from a linear collider, moving through a plasma of increasing density, but density always less than that of the beam (underdense). In this situation, the plasma electrons are expelled from the beam channel and the electrons are subject to an ever-increasing focusing force provided by the channel ions. Analysis is made on the beam radiation energy loss in the classical, the transition, and the quantum regimes. It is shown that the focuser is insensitive to the beam energy spread behaviors in the nonclassical regimes, the radiation limit on lenses (the Oide limit) can be exceeded. The sensitivity of the system to the topic mismatch and the nonlinearity is also analyzed. Examples are given with SLC-type and TLC-type parameters. 9 refs., 1 tab.

3278 (SLAC-PUB–5086) **Coherent pair creation from beam-beam interaction.** Chen, Pisin. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Sep 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890803–39: International conference on high energy accelerators, Tsukuba (Japan), 20-26 Aug 1989). Order Number DE90001817. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

It has recently been recognized that in future linear colliders, there is a finite probability that the beamstrahlung photons will turn into e^+e^- pairs induced by the same beam-beam field, and this would potentially cause background problems. In this paper, we first review the probability of such a coherent pair creation process. It is seen that the constraint on the beamstrahlung parameter, Υ, is tight of these coherent pairs to be totally suppressed. We then point out that there exists a minimum energy for the pair-created particles, which scales as $\sim 1/5\Upsilon$. When combining this condition with the deflection angle for the low-energy particles, the constraint on the allowable Υ value is much relaxed. Finally, we calculate the effective cross section for producing the weak bosons by the low-energy e^+e^- pairs. It is shown that these cross sections are substantial for $\Upsilon > 1$. We suggest that this effect can help to autoscan the particle spectrum in the high energy frontier. 10 refs., 2 figs.

3279 (UCRL–21249) **A photon accelerator.** Wilks, S.C.; Dawson, J.M.; Mori, W.B.; Katsouleas, T.; Jones, M.E. Lawrence Livermore National Lab., CA (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90002827. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A novel method of frequency upshifting short ($\lesssim 100\mu s$) pulses of laser light, which makes use of relativistic plasma waves, is described. As is well known, photons in a plasma can be thought of as particles possessing and effective mass of $m_\gamma = \hbar\omega_{pe}/c^2$ and moving with the group velocity of the laser pocket. It is also known that these photons experience a force acting on them when in the presence of a gradient in the plasma density. By using a relativistic plasma wave traveling with the photons, the energy of the photons (thus the frequency) can be continuously increased. Similarities with another laser-plasma interaction, Raman scattering, are discussed. The physical mechanism and results of particle-in-cell computer simulations will be described. 9 refs., 3 figs.

3280 **A raster scanning power supply system for controlling relativistic heavy ion beams at the Bevalac biomedical facility.** Stover, R. (Lawrence Berkeley Lab., Berkeley, CA (US)); Nyman, M.; Halliwell, J.; Lutz, I.; Dwinell, R. pp. 2030 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S IEEE Service Center, Piscataway, NJ (1987). DOE Contract AC03-76SF00098. (CONF-870302–: Particle accelerator conference, Washington, DC (USA), 16-19 Mar 1987).

A power supply system is currently being designed and constructed to sweep an 8.0 Tesla-meter relativistic heavy ion beam in a raster scanning mode for radiotherapy use. Two colinear dipole magnets with orthogonally oriented magnetic fields are driven by the system to produce a rectangular field (40 x 40 cm max.) with a uniform dose (+-2.5%) to a target volume 6 meters away. The fast horizontal scanning magnet is driven by a single power supply which in conjunction with a triac bridge network and a current regulated linear actuator produces a 1200 cm/sec max. sweep rate The slow (40 cm/sec) vertical scanning magnet is controlled by dual current regulated linear actuators in a push-pull configuration. The

scanner system can provide off-axis treatment profiles with large aspect ratios of unusual dimensions.

3281 First test of the Siberian snake magnet arrangement to overcome depolarizing resonances in a circular accelerator. Krisch, A.D. (Randall Laboratory of Physics, The University of Michigan, Ann Arbor, Michigan 48109 (US)); Mane, S.R.; Raymond, R.S.; Roser, T.; Stewart, J.A.; Terwilliger, K.M.; Vuaridel, B.; Goodwin, J.E.; Meyer, H.; Minty, M.G.; and others. *Physical Review Letters (USA)*, 63(11): 1137-1140 (11 Sep 1989).

We studied the $G\gamma=2$ imperfection depolarizing resonance at 108 MeV, both with and without a Siberian snake, by varying the resonance strength while storing beams of 104- and 120-MeV polarized protons at the Indiana University Cooler Ring. We used a cylindrically symmetric polarimeter to simultaneously study the effect of a depolarizing resonance on both the vertical and radial components of the polarization. AT 104 MeV we found that the Siberian snake eliminated the effect of the nearby $G\gamma=2$ depolarizing resonance.

3282 Classification of beam breakup instabilities in linear accelerators. Lau, Y.Y. (Beam Physics Branch, Plasma Physics Division, Naval Research Laboratory, Washington, D.C. 20375-5000 (US)). *Physical Review Letters (USA)*, 63(11): 1141-1144 (11 Sep 1989).

With the use of a standard model, beam breakup growths in all types of linacs are shown to be classified by only two dimensionless parameters which depend on the beam current, beam energy, pulse length, machine length, breakup mode frequency, focal strength, and transverse shunt impedance. This classification suggests that rf cure plays a more important role in the control of beam breakup than focusing in a long pulse beam. The converse holds for a short pulse beam.

3283 (BNL–43344) **Infra-red synchrotron radiation measurements at Brookhaven.** Williams, G.P.; Hirschmugl, C.J.; Kneedler, E.M.; Sullivan, E.A.; Siddons, D.P.; Chabal, Y.J.; Hoffmann, F.; Moeller, K.D. Brookhaven National Lab., Upton, NY (USA). 30 Sep 1988. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8808141–15: 3. international conference on synchrotron radiation instrumentation, Tsukuba (Japan), 29 Aug - 2 sep 1988). Order Number DE90002302. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We describe the spectrometer and experimental stations on the infra-red beamline (IR4) at the National Synchrotron Light Source, Brookhaven. We also report measurements of the source characteristics in the range 30–400 μ (25–350 cm^{-1}), including both flux and brightness and compare them with corresponding measurements from a 1000K black-body source. 10 refs., 3 figs.

3284 (BNL–43348) **Mechanical design of SXLS [Superconducting X-ray Lithography Source] radio-frequency cavity.** Mortazavi, P.; Sharma, S.; Keane, J.; Thomas, M. Brookhaven National Lab., Upton, NY (USA). [1989]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-890335–267: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE90002289. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

This paper presents the mechanical design of a Radio-Frequency (RF) cavity to be used on a compact storage ring for Superconducting X-ray Lithography Source (SXLS). Various design features of this cavity are discussed, including basic geometrical configuration, structural design, initial and operational tuning, vacuum multipactoring, power window, and damping of higher order modes. A second application of this cavity design for beam life extension in an existing storage ring is also described. 2 refs., 6 figs.

3285 (CONF-890906–6) **Comparison of photodesorption yields from aluminum stainless and Cu-plated beam tubes.** Halama, H.J.; Foerster, C.L. Brookhaven National Lab., Upton, NY (USA). 1989. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. From 11. international vacuum congress and 7th international conference on solid surfaces; Cologne (Germany, F.R.); 25-29 Sep 1989. Order Number DE90002428. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Photon Stimulated Desorption (PSD) from the walls of beam ducts constitutes the most serious gas load in storage rings and therefore exerts a great influence on both beam quality and lifetime. With the exception of the SSC which plans to use a Cu-plated beam tube, all existing and proposed machines use either aluminum or stainless steel beam tubes. In order to develop techniques for producing surfaces with the lowest PSD, we have studied the above materials using a dedicated beam line at the National Synchrotron Light Source (NSLS). Three meter long tubes were exposed to white light beams having critical energy of 500 eV and the desorption yields were measured as a function of beam dose. Several treatments commonly used for cleaning surfaces (prebaked, baked, fired, chemically cleaned and dc glow discharged) were investigated, and their relative merits are discussed. The results from sample tube measurements are compared with those from the X-rya ring Al beam tube during operation. The agreement is found to be quite good. Glow discharge cleaned stainless steel exhibited the lowest desorption yield. 7 refs., 9 figs.

3286 (DOE/ER/40266–2) **Development of polarized ion beams and polarized gas targets: Final scientific report.** Anderson, L.W. Wisconsin Univ., Madison, WI (USA). Dept. of Physics. [1989]. 29p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER40266. Order Number DE90002769. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This final scientific report for DOE Grant No. FG02-86ER40266 summarizes the research carried out with DOE support on the uses of optical pumping for producing polarized ion sources and targets for nuclear physics experiments. This report is broken up into two subsections. The first subsection is on the use of optical pumping in the production of polarized H^- ions, and the second subsection is on the use of optical pumping for polarized targets. 27 refs., 6 figs., 3 tabs.

3287 (FNAL-TM–1623) **Structural performance of the first SSC [Superconducting Super Collider] Design B dipole magnet.** Nicol, T.H. Fermi National Accelerator Lab., Batavia, IL (USA). Sep 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890701–21: International cryogenic materials conference, Los Angeles, CA (USA), 24-28 Jul 1989). Order Number DE90003184. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The first Design B Superconducting Super Collider (SSC) dipole magnet has been successfully tested. This magnet was heavily instrumented with temperature and strain gage sensors in order to evaluate its adherence to design constraints and design calculations. The instrumentation and associated data acquisition system allowed monitoring of the magnet during cooldown, warmup, and quench testing. This paper will focus on the results obtained from structural measurements on the suspension system during normal and rapid cooldowns and during quench studies at full magnet current. 4 refs., 9 figs.

3288 (FNAL-TM–1626) **SSC [Superconducting Super Collider] supplementary conceptual design report: Cryogenics for detectors.** Fast, R.W. Fermi National Accelerator Lab., Batavia, IL (USA). 27 Sep 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE90003183. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This technical memorandum contains text provided to the SSC for their use in the Supplementary Conceptual Design Report. It was written as part of a Fermilab effort under the guidance of Ray Stefanski of the Fermilab Research Division. This particular memorandum considers the cryogenic systems required to support the superconducting magnets and liquid argon calorimeters associated with SSC detectors.

3289 (INIS-mf–12013, pp. 6-8) **The Heidelberg heavy ion postaccelerator.** Blum, M.; Brix, P.; Frauenfeld, M.; Friedrich, A.; Grieser, M.; Geyer, C.; Hahn, W.; Hemberger, K.H.; Holzer, B.; Horn, K. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear*

Physics. Annual report 1987. Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The Heidelberg Heavy Ion Postaccelerator has been operated in 1987 reliably in many beamtimes up to the summer shut down necessary to extend its high energy beam transport line by 30 m to set up the injection path for the TSR storage ring. A total of 5 new dipole magnets and 18 quadrupole lenses had to be incorporated. The complete transport system was operational again end of November allowing for a first beamtime at the crystal ball experiment. The completed injection beam line for the TSR made a first successful test with the storage ring injection components possible on December 19. (orig.).

3290 (INIS-mf–12013, pp. 27) **The source for polarized alkali ions.** Reich, H.; Baumann, P.; Butsch, R.; Giroux, J.; Jaensch, H.; Kober, G.; Leucker, H.; Mayer, R.; Moroz, Z.; Ott, W. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The source for polarized heavy ions (PSI) has been used to produce polarized beams of ^{6}Li and ^{23}Na. Reactions of ^{6}Li on ^{26}Mg at 44 MeV and ^{23}Na on ^{206}Pb at 170 MeV have been investigated. The method of polarizing an alkali atomic beam by optical pumping has been improved by using an electrooptic modulated laser beam. In accordance with the primary work of J. Kelly (Boulder, USA) and W. Ertmer (Bonn, FRG), a $LiTaO_3$ electrooptic modulator has been constructed and with this new equipment, the figure of merit of the source has been improved by a factor of 4. (orig.).

The preparations for laser cooling of ^{7}Li^{+} and ^{9}Be^{+} ions in the TSR are described. (orig.).

3295 (INIS-mf–12013, pp. 158) **Development of a laser ion source for xenon.** Wunderlich, R.; Schneider, K.; Kiko, J.; Kirsten, T. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

An ion source for xenon has been developed based on resonant laser ionization of xenon atoms. The source combines high sensitivity with chemical selectivity. The values for the sensitivity and selectivity obtained are 2.5×10^{-4} Amp/Torr and 40, respectively. The latter value is a lower limit. This ion source is now implemented into a time of flight mass spectrometer. (orig.).

3296 (INS–744) **Design of a large superconducting spectrometer magnet.** Shintomi, T.; Makida, Y.; Mito, T.; Yamanoi, Y.; Hashimito, O.; Nagae, T. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Apr 1989. 4p. Order Number DE90719505. Available from NTIS (US Sales Only), PC A02/MF A01.

The superconducting spectrometer magnet for nuclear physics experiments has been under construction by Institute for Nuclear Study, University of Tokyo with collaboration from KEK. The magnet has a sector type coil. The magnetic field is 3 T with the magnet gap of 50 cm and the stored energy is 11.8 MJ. The easy operation and maintenance are taken into consideration in addition to usual design concept. Three dimensional magnetic field calculation and the stress analysis have been performed. The code 'QUENCH' was applied to decide the operation current and to check the safety of the coil. As a result, the current of 500 A was selected. The heat leaks were checked and estimated less than 2 W at 4 K. A small refrigerator is to be used for thermal insulations at 80 and 20 K. (author).

3297 (LA–11662-MS) **Report from the workshop on computing directions and options for data acquisition and analysis at LAMPF [Los Alamos Meson Physics Facility].** Oothoudt, M.A.; Hoehn, M.V.; Amann, J.F.; Bemis, C.B.; Carey, T.A.; Cooper, P.S.; Cort, G.P.; Harrison, J.F.; Kinney, E.R.; Kozlowski, T.; Loken, S.C.; Louis, W.C.; Mischke, R.E.; Wouters, J.M. Los Alamos National Lab., NM (USA). Oct 1989. 40p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8901165–Summ.: Workshop on computing directions and options for data acquisition and analysis at LAMPF, Los Alamos, NM (USA), 11-13 Jan 1989). Order Number DE90001776. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A workshop met in January 1989 to review future requirements for computer support of the experimental program in medium energy physics at the Los Alamos Meson Physics Facility. The recommendations of the workshop are presented. 18 refs., 2 figs., 1 tab.

3298 (LA-UR–89-3397) **INEX [integrated numerical experiment] simulations of the Los Alamos HIBAF [high-brightness accelerator free-electron laser] free-electron laser MOPA [master oscillator power amplifier] experiment.** Goldstein, J.C.; Carlsten, B.E.; McVey, B.D. Los Alamos National Lab., NM (USA). 1989. 17p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-36. (CONF-8908134–10: 11. international free electron laser conference, Naples, FL (USA), 28 Aug - 1 sep 1989). Order Number DE90002387. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We present results of Integrated Numerical Experiment (INEX) simulations of the performance of a 1-m untapered wiggler FEL oscillator driving a 2-m wiggler FEL amplifier for the new HIBAF (High-Brightness Accelerator Free-Electron Laser) facility at Los Alamos. INEX simulations utilize a numerically-generated electron micropulse, from ISIS/PARMELA calculations of the photoinjector/linac/beam transport system, in the 3-D FEL simulation code FELEX. 13 refs., 10 figs., 1 tab.

3299 (LBL–21520) **Ground motion measurements at the 1 - 2 GeV synchrotron radiation source site.** Green, M.A.; Majer, E.L.; More, V.D.; O'Connell, D.R.; Shilling, R.C. Lawrence Berkeley Lab., CA (USA). May 1986. 35p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90003046. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report describes the technique for measuring ground motion at the site of the 1–2 GeV Synchrotron Radiation Source (Light

Source) at Building 6. The results of ground motion measurements at the Light Source site are presented. As comparison, ground motion measurements were made at the Byerly Tunnel, the Bevatron, Blackberry Canyon, and SLAC at the Spear Ring. The primary ground motion at the Light Source site is in a band from 10 to 30 Hz. This noise is local in origin and is not easily transported through LBL soils. The background ground motion is for the most part less than 0.1 microns. Localized truck traffic near Building 6 and the operation of the cranes in the building can result in local ground motions of a micron or more for short periods of time. The background ground motion at Building 6 is between 1 and 2 orders of magnitude higher than ground motion in a quiet seismic tunnel. Ground motion at SLAC and the Bevatron is comparable to ground motions measured at the Building 6 Light Source site. The frequency signature of each site is very different. 8 refs., 20 figs., 1 tab.

3300 (LBL–26248) **An alternate end design for SSC dipoles.** Peters, C.; Caspi, S.; Taylor, C. Lawrence Berkeley Lab., CA (USA). Feb 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890270–24: International industrial symposium on the super collider, New Orleans, LA (USA), 8-10 Feb 1989). Order Number DE90003107. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Experience in the SSC dipole program has shown that fabrication of cylindrical coil ends is difficult. Cable stiffness requires large forces to maintain the proper position of the conductors in the end during winding. After winding, the coil ends remain distorted nd significant motion of the need conductors is required to force the coil end into the molding cavity. Local mechanical stresses are high during this process and extra pieces of insulation are required to prevent turn-to-turn shorts from developing during the winding and molding steps. Prior to assembly the coil end is compressed in a mold cavity and injected with a filler material to correct surface irregularities and fill voids in the end. LBL has developed an alternate design which permits the conductors to be wound over the end using minimal force and technician coerosion. The conductors are placed on a conical surface where the largest diameter over the outer layer conductors is 10 cm. No coil end spaces or insulation pieces between turns are required. The conductor geometry was analytically optimized to meet SSC multipole requirements for the ends. The first 1-m dipole utilizing this end geometry has been constructed and successfully tested. Design and construction data are presented. Also model test results, including training and multipole measurements of the end are given. 1 ref., 12 figs., 3 tabs.

3301 (LBL–26842) **Broad-beam multi-ampere metal ion source.** Brown, I.G.; Galvin, J.E.; MacGill, R.A.; Paoloni, F.J. Lawrence Berkeley Lab., CA (USA). Jun 1989. 9p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890703–25: International conference on ion sources, Berkeley, CA (USA), 10-14 Jul 1989). Order Number DE90003106. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

An embodiment of the MEVVA (metal vapor vacuum arc) high current metal ion source has been developed in which the beam is formed from a 10-cm diameter set of extractor grids and which produces a peak beam current of up to several Amperes. The source, MEVVA V, operates in a pulsed mode with a pulse width at present 0.25 ms and a repetition rate of up to several tens of pulses per second (power supply limited). The multicathode feature that was developed for the prior source version, MEVVA IV, has been incorporated here also; one can switch between any of 18 separate cathodes and thus metallic beam species. Maximum beam extraction voltage is over 90 kV, and since the ion charge state typically from Q = 1 to 5, depending on the metal employed, the ion energy in the extracted beam can thus be up to several hundred keV. This source is a new addition to the MEVVA family of metal ion sources, and we are at present investigating the operational regimes and the limits to the source performance. In this paper we describe the source and present some preliminary results. 10 refs., 4 figs.

3302 (LBL–26843) **Charge state distribution studies of the metal vapor vacuum arc ion source.** Galvin, J.E.; Brown, I.G.; MacGill, R.A. Lawrence Berkeley Lab., CA (USA). Jun 1989. 12p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890703–27: International conference on ion sources, Berkeley, CA (USA), 10-14 Jul 1989). Order Number DE90003270. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We have studied the charge state distribution of the ion beam produced by the MEVVA (metal vapor vacuum arc) high current metal ion source. Beams produced from a wide range of cathode materials have been examined and the charge state distributions have been measured as a function of many operational parameters. In this paper we review the charge state data we have accumulated, with particular emphasis on the time history of the distribution throughout the arc current pulse duration. We find that in general the spectra remain quite constant throughout most of the beam pulse, so long as the arc current is constant. There is an interesting early-time transient behavior when the arc is first initiated and the arc current is still rising, during which time the ion charge states produced are observed to be significantly higher than during the steady current region that follows. 12 refs., 5 figs.

3303 (LBL–26844) **Some novel design features of the LBL metal vapor vacuum arc ion sources.** MacGill, R.A.; Brown, I.G.; Galvin, J.E. Lawrence Berkeley Lab., CA (USA). Jun 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890703–26: International conference on ion sources, Berkeley, CA (USA), 10-14 Jul 1989). Order Number DE90003271. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The family of MEVVA (metal vapor vacuum arc) high current metal ion sources developed at LBL over the past several years has grown to include a number of different source versions with a wide range of some of the design and operational parameters. The MicroMEVVA source is a particularly compact version, about 2 cm diameter and 10 cm long, while the MEVVA IV weighs some 30 kG. MEVVAs IV and V incorporate multiple cathode assemblies (16 and 18 separate cathodes, respectively), and the operating cathode can be switched rapidly and without down-time. The new MEVVA V embodiment is quite compact considering its broad beam (10 cm), high voltage (100 kV) and multiple cathode features. The large-area extractor grids used in the MEVVA V were fabricated using a particularly simple technique, and they are clamped into position and so can be changed simply and quickly. The electrical system used to drive the arc is particularly simple and incorporates several attractive features. In this paper we review and describe a number of the mechanical and electrical design features that have been developed for these sources. 9 refs., 5 figs.

3304 (LBL–27339) **A high charge state multicusp ion source.** Leung, K.N.; Keller, R. Lawrence Berkeley Lab., CA (USA). Jun 1989. 15p. Sponsored by U.S. DOE Energy Research; Center for Heavy Ion Research (Gesellschaft fuer Schwerionenforschung Darmstadt - GSI Darmstadt); North Atlantic Treaty Organization. DOE Contract AC03-76SF00098. (CONF-890703–28: International conference on ion sources, Berkeley, CA (USA), 10-14 Jul 1989). Order Number DE90000126. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Attempts have been made to generate high charge state ion beams by employing a multicusp plasma source. Three experimental investigations have been performed at LBL and at GSI to study the charge state distributions and the emittance of the extracted beam. Results demonstrate that charge state as high as +7 can be obtained with argon or xenon plasmas. The brightness of a 11 mA xenon ion beam is found to be 26 $A/(\pi\text{-mm-mrad})^2$. 6 refs., 6 figs.

3305 (LBL–27421) **Operation of a DC large aperture volume-production H^- source.** Kwan, J.W.; Ackerman, G.D.; Anderson, O.A.; Chan, C.F.; Cooper, W.S.; deVries, G.J.; Leung, K.N.; Lietzke, A.F.; Steele, W.F. Lawrence Berkeley Lab., CA (USA). Apr 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890703–23: International conference on ion sources, Berkeley, CA (USA), 10-14 Jul 1989). Order Number DE90002668. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In testing a multicusp volume-production H^- ion source (20 cm diameter, 23 cm long), we optimized the gas pressure, the plasma electrode bias potential and the magnetic filter. At the optimum

pressure of 9 mT, the H^- beam output increased linearly with discharge power. The maximum H^- beam, measured with a current transformer downstream of the accelerator, was 100 mA while using a 6.67 cm^2 aperture. Presently we are limited by overheating of the cathodes by the plasma ions. Under similar discharge conditions the maximum H^- current density was found to vary as $a^{-0.7}$ where a is the aperture radius. Results from emittance measurements showed that the effective H^- ion temperature increased with a for $a > 0.8$ cm. Thus the brightness of the beam decreased with increasing aperture radius. Operating the source with cesium would increase the H^- output however our accelerator must be improved to avoid breakdowns caused by the cesium contamination. 8 refs., 6 figs.

3306 (LBL–27606) **ECR sources for the production of highly charged ions.** Lyneis, C.M.; Antaya, T.A. Lawrence Berkeley Lab., CA (USA). Sep 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890703–24: International conference on ion sources, Berkeley, CA (USA), 10-14 Jul 1989). Order Number DE90002670. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Electron Cyclotron Resonance Ion Sources (ECRIS) using RF between 5 and 16 GHz have been developed into stable, reliable sources of highly charged ions produced from a wide range of elements. These devices are currently used as ion sources for cyclotrons, synchrotrons, and heavy-ion linacs for nuclear and relativistic heavy-ion physics. They also serve the atomic physics community as a source of low energy multiply-charged ions. In order to improve their performance both with respect to maximum charge state and beam intensity, ECRIS builders are now designing and constructing sources which will operate at frequencies up to 30 GHz. In this paper we review the present status of operating ECRIS, review recent experimental measurements on plasma parameters, and look at the technology and potential of sources operating at frequencies up to 30 GHz. 14 refs., 4 figs., 1 tab.

3307 (LBL–27664) **Successful observation of Schottky signals at the Tevatron collider.** Goldberg, D.A.; Lambertson, G.R. Lawrence Berkeley Lab., CA (USA). Aug 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890803–35: International conference on high energy accelerators, Tsukuba (Japan), 20-26 Aug 1989). Order Number DE90002166. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

We have constructed a Schottky detector for the Tevatron collider in the form of a high-Q (≈5000) cavity which operates at roughly 2 GHz, well above the frequency at which the Tevatron's single-bunch frequency spectrum begins to roll off. Initial spectra obtained from the detector show clearly observable Schottky betatron lines, free of coherent contaminants; also seen are the "common-mode" longitudinal signals due to the offset of the beam from the detector center. The latter signals indicate that at 2 GHz, the coherent single-bunch spectrum from the detector is reduced by >80 dB; therefore, in normal collider operation, the Schottky betatron lines are >40 dB greater than their coherent counterparts. We describe how the data we have obtained give information on transverse and longitudinal emittances, synchrotron frequency, and betatron tunes, as well as reveal what may be previously unobserved phenomena. Space limitations restrict us to presenting only as much data as should be necessary to convince even the skeptical reader of the validity of the claim made in the paper's title. 3 refs., 2 figs.

3308 (SAND–89-7106) **Single fluid simulations of plasma openings switch behavior.** Frese, M.H.; Payne, S.S.; Peterkin, R.E. Jr. Sandia National Labs., Albuquerque, NM (USA); Mission Research Corp., Albuquerque, NM (USA). Sep 1989. 119p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE90002643. Available from NTIS, PC A06/MF A01 - OSTI.

The bulk of this report summarizes a study of plasma opening switch (POS) behavior using a two-dimensional single fluid code known as MACH2. This effort developed a model for the plasma motion during injection and the resultant mass distribution at the time of accelerator during that was consistent with the plasma diagnostic information obtained from experiments performed on the PBFA II accelerator at Sandia National Laboratories. The emphasis in this follow-on effort has been on developing a single fluid model of the switching process itself. The ability to model a POS in a reasonable manner with a single fluid code was first demonstrated with the two-dimensional HAM code. Subsequent studies of the operation of a POS that employ HAM and were performed during the last quarter of this research effort are also discussed in this report. Most of the MACH2 simulations discussed in this report were performed on Cray supercomputers at Los Alamos National Laboratory. During the course of this research effort, MACH2 was installed on the Sandia Cray computer. The HAM code already existed on the Sandia Cray and all HAM simulations took place on that computer. The model described here produced current histories qualitatively like those of the PBFA II experiments. In this model, the plasma gets pushed past the B-dot probes and into the walls and diode region, while the current sheet initially at the vacuum/plasma interface diffuses into the plasma due to the micro-turbulent resistivity. The anomalous collision frequency used in the MACH2 resistivity calculation is approximately 3 times the ion collision frequency. The conduction and switching times predicted by the model are determined by the initial density of the switch plasma; they are most consistent with experiments if the initial plasma is taken to be hydrogen between 1 and 3 $\times 10^{13}$ ions/cm^3 or carbon at a factor of 12 lower density.

3309 (SLAC-TN–89-1) **Finding the magnetic center of a quadrupole to high resolution: A draft proposal.** Fischer, G.E.; Cobb, J.K.; Jensen, D.R. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Mar 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. Order Number DE90002797. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In a companion proposal it is proposed to align quadrupoles of a transport line to within transverse tolerances of 5 to 10 micrometers. Such a proposal is meaningful only if the effective magnetic center of such lenses can in fact be repeatably located with respect to some external mechanical tooling to comparable accuracy. It is the purpose of this note to describe some new methods and procedures that will accomplish this aim. It will be shown that these methods are capable of yielding greater sensitivity than the more traditional methods used in the past. The notion of the "nodal" point is exploited. 4 refs., 5 figs., 1 tab.

3310 (SLAC-TN–89-2) **Final focus test beam alignment: A draft proposal.** Fischer, G.E.; Ruland, R.E. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Mar 1989. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. Order Number DE90002798. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Final Focus Test Beam is a transport line designed to transmit 50 GeV electron beams of SLC emittance (3×10^{-10} radian-meters) straight through the central arm of the Beam Switchyard (BSY C line) with a final focus point out in the Research Yard but relatively near the end of the switchyard tunnel. The hardware, methods and procedures outlined in this proposal are dedicated to measuring the placement of mechanical objects with respect to certain defined geometric axes. We wish to emphasize that the very difficult problems of locating the effective magnetic axes of focusing elements, the effective electrical center of beam position monitors and even the effective axis of the incident beam relative to mechanical reference surfaces is outside the scope of this work. Further, this proposal is restricted to the act of measurement and does not consider the vital task of on-line mechanical repositioning of elements that will, in likelihood, be called upon during operation of the system. 16 refs., 16 figs., 4 tabs.

3311 **Lithium beam measurements on PBFA II.** Ruiz, C.L. (Sandia National Labs., Albuquerque, NM (US)); Bieg, K.W.; Johnson, D.J.; Leeper, R.J.; Lockner, T.R.; Maenchen, J.; Mehlhorn, T.A.; Pregenzer, A.L.; Stygar, W.A.; Woodworth, J.R. pp. 160 of Conference record of the 1988 IEEE international conference on plasma science (abstracts). IEEE Service Center, Piscataway, NJ (1988). DOE Contract AC04-76DP00789. (CONF-880651–: IEEE international conference on plasma science, Seattle, WA (USA), 6-8 Jun 1988).

Technical Paper 2P31.

Recent experiments on PBFA II indicate that lithium ion beams are being produced with regularity. Evidence for the production of

energetic lithium ions is based on measurements employing Thomson Parabola analyzers, Cu(n,2n) activation, and other diagnostics. In this paper lithium ions beam data, based on Thomson parabola and activation measurements, are presented. Three types of ion sources are pursued. Corroborating results with other diagnostics are also discussed.

3312 **Applications of RF linacs to free-electron lasers and particle beams.** Jameson, R.A. (Los Alamos National Lab., NM (USA)). *Journal of Fusion Energy (USA),* 6(4): 329-335 (Dec 1987). (CONF-870457–: Annual meeting of Fusion Power Associates: applications of laser, particle beam, and RF power technologies, Pleasanton, CA (USA), 8-9 Apr 1987).

The applications of radio frequency linear accelerators to the electron beam pumping of free electron lasers and to the production of neutral particle beams are evaluated in relation to technology development for the Strategic Defense Initiative and to fusion reactor research. Beam dynamics and ion source requirements and developments are addressed. The design of an RF cavity and its performance and materials requirements are assessed.

3313 **Applications of induction linacs to free-electron lasers and particle beams.** Briggs, R.J. (Lawrence Livermore National Lab., CA (USA)). *Journal of Fusion Energy (USA),* 6(4): 337-343 (Dec 1987). (CONF-870457–: Annual meeting of Fusion Power Associates: applications of laser, particle beam, and RF power technologies, Pleasanton, CA (USA), 8-9 Apr 1987).

The applications of induction linacs to the electron beam pumping of free electron lasers and the production of particle beams are reviewed. Induction technology for high beam current production is described within the context of particle beam weapons and free electron laser research and development. Material and magnet research is reviewed along with beam dynamics, propagation, and steering. Component technology experimentation and development conducted at Lawrence Livermore are reviewed.

4304 Storage Rings

Refer also to citation(s) 2818, 3962

3314 (BNL–43347) **Vacuum system design for a superconducting x-ray lithography light source.** Schuchman, J.C. Brookhaven National Lab., Upton, NY (USA). [1989]. 16p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-890906–5: 11. international vacuum congress and 7th international conference on solid surfaces, Cologne (Germany, F.R.), 25-29 Sep 1989). Order Number DE90002296. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A superconducting electron storage ring for x-ray lithography (SXLS) is to be built at Brookhaven National Laboratory (BNL). The goal is to design and construct a light source specifically dedicated to x-ray lithography production and which would be used as a prototype in a technology transfer to American industry. The machine will be built in two phases: Phase I, a low energy ring (200 MeV 500ma) using all room temperature magnets which will be used primarily for low energy injection studies. Phase II will be a full energy machine (690 MeV 500ma) where the room temperature 180° dipole magnets of Phase I will be replaced with superconducting magnets. The machine, with a racetrack shape and a circumference of 8.5 meters, is designed to be portable and replaceable as a single unit. This paper will discuss the vacuum system design for both phases; i.e., gas desorption, warm bore vs cold bore, ion trapping, clearing electrodes, and diagnostic instrumentation. It would seem that a compact light source, relatively small in size for an electron storage ring, would be simple to design and build. That is not the case, however, since all the problems that arise for a larger machine must be addressed. From a vacuum standpoint, gas desorption, pumping, chamber material and design, ion trapping, diagnostics, etc. must all be considered. However, for a small machine not as many parts have to be made. 6 figs., 1 tab.

3315 (BNL–43350) **Pretreatment and conditioning of storage ring vacuum systems.** Halama, H.J. Brookhaven National Lab., Upton, NY (USA). [1989]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8904282–1: 22. annual American Vacuum Society Southern California symposium, Los Angeles, CA (USA), 3-7 Apr 1989). Order Number DE90002297. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The performance of a storage ring is measured in terms of beam lifetime, beam size, beam stability and recovery of normal operating pressure. In order to insure successful operation, one starts with the proper material selection, followed by the desired conditioning of all components before they are installed in the storage ring. Then the entire ring is leak-checked and thoroughly baked-out. After cooldown the average pressure in the ring reaches the 10^{-10} Torr range with hydrogen constituting more than 90% of residual gas. The final clean-up, known as beam commissioning, is done by the particle beam itself. In this paper a review and discussion of the following will be presented: chemical cleaning techniques for the most commonly used metals (aluminum, stainless steel and copper); RF and DC glow discharge treatments and their effect on both outgassing and photon stimulated desorption; reactive gas cleaning; RF cavity conditioning including multipactoring suppression; final bake-out; beam commissioning. 30 refs., 10 figs.

3316 (CONF-890826–5) **Crystalline beams.** Schiffer, J.P. Argonne National Lab., IL (USA). 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From International nuclear physics conference; Sao Paulo (Brazil); 20-26 Aug 1989. Order Number DE90002174. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Ions in a storage ring are confined to a mean orbit by focusing elements. To a first approximation these may be described by a constant harmonic restoring force: $F = -Kr$. If the particles in the frame moving along with the beam have small random thermal energies, then they will occupy a cylindrical volume around the mean orbit and the focusing force will be balanced by that from the mutual repulsion of the particles. Inside the cylinder only residual two-particle interactions will play a significant role and some form of ordering might be expected to take place. The results of some of the first MD calculations showed a surprising result: not only were the particles arranged in the form of a tube, but they formed well-defined layers: concentric shells, with the particles in each shell arranged in a hexagonal lattice that is characteristic of two-dimensional Coulomb systems. This paper discusses the condense layer structure.

3317 (CONF-8904281–1) **Quadrupole magnet for the APS [Advanced Photon Source] storage ring.** Thompson, K.M.; Kim, S.H.; Lari, R.J.; Turner, L.R. Argonne National Lab., IL (USA). [1989]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Particle accelerator conference; Chicago, IL (USA); 20-23 Apr 1989. Order Number DE90002255. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

An asymmetric core geometry has been selected for the quadrupole magnets in the storage ring of the Advanced Photon Source (APS) in order to accommodate the vacuum chamber and photon beam pipes. The requirements of the position beam make it necessary that the magnet be able to produce a field gradient of 20-T/m with high accuracy. The design for this magnet has been fully developed in preparation for the construction of a prototype. Some unique features included in the design are described. Design choices are being validated by extensive magnetic-field calculations in both two and three dimensions. The results of these calculations are presented. 6 refs., 4 figs., 5 tabs.

3318 (CONF-8908170–2) **Overview of the advanced photon source.** Moncton, D.E.; Crosbie, E.; Shenoy, G.K. Argonne National Lab., IL (USA). May 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 3. international conference on synchrotron radiation instrumentation; Tsukuba (Japan); 29 Aug - 2 sep 1989. Order Number DE90002179. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Advanced Photon Source planned for construction at Argonne National Laboratory is based on a low-emittance storage-ring operated at 7 GeV and capable of providing tunable undulator radiation from 4 to 40 keV (using the first and the third harmonics). A technical description of the accelerator facility and the storage-ring is presented in this overview, along with a brief summary of the characteristics of radiation that will be available from the insertion

devices. Various plans for user access to this national user facility are also given. 8 refs., 2 figs.

3319 (DOE/ER/40224–86) **Theory of elementary particles studies in weak interaction and grand unification and studies in accelerator design: Annual report, Task B.** Csonka, P.L. Oregon Univ., Eugene, OR (USA). [1989]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-85ER40224. Order Number DE90003325. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

During the past year the investigation of micropole undulators continued. These devices were proposed as a means of extending the range of useful photon energies emerging from high energy electron storage rings, as well as devices capable of reducing the size, expense and circulating electron energy required to generate radiated photons of a given wavelength. Various applications of these devices were studied, and the conditions under which alternative types of micropole devices can be employed in storage rings of given characteristics, were explored. During the year covered by this report of activities a patent on micropole undulators was obtained.

3320 (GAO/RCED–89-18) **Federal research: Determination of the best qualified sites for DOE's super collider.** General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div. 1989. 68p. Available from US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

In January 1987 the administration proposed to construct the world's largest high-energy physics accelerator, known as the superconducting super collider, to advance scientific knowledge about the fundamental components of matter and the laws that underlie all physical processes. In April 1987 the Department of Energy issued an invitation for site proposals. In selecting the best qualified sites, Energy received technical assistance from the National Academy of Sciences and the National Academy of Engineering, which jointly formed a site evaluation committee. Available documentation and interviews with committee members and staff indicated that it used Energy's site selection criteria in their order of importance and that the process was fair in selecting the Dallas-Ft. Worth, Texas, as the preferred site. This process is discussed in this paper.

3321 (INIS-mf–12013, pp. 8-26) **The Heidelberg heavy ion test storage ring.** Arnold, W. (Giessen Univ. (Germany, F.R.)); Drdlicik-Lex, E.; Hielscher, D.G.; Matl, K.; Neumann, R.; Noda, A.; Pierce, P.; Thivent, M.; Trincat, B.; Schuch, R. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

In the time of the report it was possible to finish a large part of the construction work at the Heidelberg test storage ring. Important interim steps were among others: - Field measurement of the eight dipole magnets - measurement of the twenty quadrupole lenses - calibration of the 28 main magnets - manufacture and installation of the twelve sextupole magnets - finishing of the cabling - delivery and taking into operation of the power supplies - installation of the injection components - construction of the vacuum system in sector 1 - finishing of the transfer line between postaccelerator and TSR. These activities culminated in a first beam test at December 19, 1987 in which a 65 MeV C^{5+} plus beam was injected by the injection components into the ring and measured after deviation by 90^0 at the end of the sector 1 in a Faraday cup. The test required that all magnet systems of the ring worked. Without larger problems it succeeded to guide the beam with 100% transmission by the septa into the TSR and to transport around 1/4 of the ring periphery. (orig.).

3322 (INIS-mf–12013, pp. 36-37) **Filter target experiment (FILTEX).** Korsch, W. (Marburg Univ. (Germany, F.R.). Fachbereich 13 - Physik); Luck, W.; Giroux, J.; Graw, G.; Schiemenz, P.; Pohlenz, D.; Jaensch, H.; Kober, G.; Steffens, E.; Vogt, H. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

This experiment has been proposed in order to polarize antiprotons circulating in a storage ring by means of an internal polarized hydrogen target and to measure spin-dependent observables in panti p interaction. A dense H target for the proton test experiment prepared for the TSR is being constructed. The status of the target is described. (orig.).

3323 (JAERI-M–89-066) **Undulator sources at a 8 GeV storage ring.** Harami, Taikan. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 45p. Order Number DE90719531. Available from NTIS (US Sales Only), PC A03/MF A01.

The use of undulators plays an important role as a high brilliance sources of synchrotron photon at a facility having an electron (or positron) storage ring. This paper describes the characteristics, tunability from gap variation and brilliance of synchrotron photon from undulators at a 8 GeV storage ring. The numerical studies show the following results. (1) Undulators for a 8 GeV storage ring can cover the first harmonic photon energy range from about 0.3 to 30 keV and the third harmonic photon from 0.85 to 70 keV. (2) The brilliance of undulator can be expected to be the order of 10^{21} photons/(sec mm^2 $mrad^2$ 0.1% band width mA), without size and angular spread in the electron beam (diffraction limit). (3) The peak brilliance has a broad maximum as a function of β function of the lattice and is shown to be practically independent on the β function. The peak brilliance is calculated to be the order of 10^{16} photons/(sec mm^2 $mrad^2$ 0.1% band width mA) at the electron beam emittance of 5×10^{-9} mcenter dotrad (undulator length 2 m). (4) The nuclei of ^{57}Fe, ^{119}Sn and ^{238}U are expected to be the candidates for the Moessbauer scattering experiment using synchrotron photon from a 8 GeV storage ring. (author).

3324 (JAERI-M–89-079) **Flux and power spectra of photon sources from bending magnets and insertion devices at a 8 GeV storage ring.** Harami, Taikan. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 43p. Order Number DE90719538. Available from NTIS (US Sales Only), PC A03/MF A01.

The synchrotron photon from bending magnets and insertion devices (undulator and wiggler) plays an important role not only for scientific research but also for heat generation on the optical devices in a beam line for a high brilliant synchrotron photon facility. This paper describes the flux and power spectra of the synchrotron photon from bending magnets and insertion devices in a 8 GeV storage ring (electron beam current of 100 mA). The numerical studies show the following results. (1) The peak power density from a bending magnet is 1.33 kW/$mrad^2$ in the horizontal plane. The storage ring having 96 dipoles radiates the total power of 835 kW. (2) The energy shifter increases the critical energy to 127.7 keV at the magnetic field of 3 tesla. (3) The multipole wiggler can yield the maximum photon flux of 1.5×10^{15} photons/sec 0.1% band width. The total radiated power from a wiggler with the peak magnetic field of 1.0 tesla and the length of 4 m is 16.2 kW. The peak power density is 178 kW/$mrad^2$ in the forward direction. (4) The undulator with the length of 2 m and the peak magnetic field of 0.4 tesla yields the total power of 1.3 kW. The power density in the forward direction is expected to be between 100 $\sim$ 200 kW/$mrad^2$, depending on the undulator period and gap. (author).

3325 (JYFL-RR–1/1987) **Beam dynamical studies of cryring. Quarterly report 3. quarter 1987.** Heikkinen, Pauli. Jyvaeskylae Univ. (Finland). Dept. of Physics. Sep 1987. 89p. Order Number DE90608638. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

This thesis consits of two parts. Part 1 (Introduction to Accelerator Physics) gives the basis of understanding the formalism and parameters that are used in accelerator physics, especially in synchrotron theory. As an appendix of part 1 there is a short introduction to electron cooling which appears in the latter part of the thesis. Part 2 (Beam Dynamical Studies of CRYRING - Lattice Design Criteria and Operation Limits) was originally written and the work was done at the Research Institute of Physics in Stockholm as a part of the CRYRING project. Later, after some modifications in the lattice, the text was updated and some electron cooling simulation calculations with intrabeam scattering were done at the Department of Physics, University of Jyvaeskylae. CRYRING is a small acceletarot and storage ring for heavy ions and it will replace the old classical 225 cm cyclotron. CRYRING will mostly be used for atomic and molecular physics but nuclear physics will not be totally forgotten. Atomic physics, which will be done inside of the ring, requires the best beam quality. Good quality in this context means

small energy spread and small beam size and divergence (transverse velocity). The beam quality will be increased by using electron cooling. Nevertheless, increasing beam quality brings along some unwanted effects. If energy spread is decreased too much the beam will get ino some instabilities - the most important of them here is the microwave instability. There are some competing processes to cooling. They attempt to increase the energy spread and the emittance (divergence) of the beam. There processes are residual gas scattering and intrabeam scattering. Due to very strict vaccuum requirements residual gas scattering will be more or less harmless as emittance growth is concerned whereas intrabeam scattering will set the limi for beam quality where one parameter is the beam intensity. (Abstract Truncated)

3326 **Federal research: Determination of the best qualified sites for DOE's super collider.** 423p. US General Accounting Office, Gaithersburg, MD (1987).

In January 1987 the administration proposed to construct the world's largest high-energy physics accelerator, known as the superconducting super collider, to advance scientific knowledge about the fundamental components of matter and the laws that underlie all physical processes. In April 1987 the Department of Energy issued an invitation for site proposals that described the criteria and process for selecting the site. In selecting the best qualified sites, Energy received technical assistance from the National Academy of Sciences and the National Academy of Engineering, which jointly formed a site evaluation committee. Available documentation and interviews with committee members and staff indicate that it used Energy's site selection criteria in their order of importance and that the process was fair in selecting the Dallas-Ft. Worth, Texas, as the preferred site.

3327 **Random errors in the magnetic field coefficients of superconducting quadrupole magnets.** Herrera, J. (Brookhaven Nat. Lab., Upton, NY (US)); Hogue, R.; Prodell, A.; Thompson, P.; Wanderer, P.; Willen, E. pp. 2030 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S IEEE Service Center, Piscataway, NJ (1987). (CONF-870302–: Particle accelerator conference, Washington, DC (USA), 16-19 Mar 1987).

The authors have studied the random errors in the multipole coefficients of superconducting dipole magnets that result from asymmetries in their construction. In this paper they consider, in a similar way, the random multipole errors of superconducting quadrupoles. Perfect symmetry of construction in such a magnet allows only higher normal multipoles of 12 pole, 20 pole, etc. to be present in the magnetic field. However, when the conductors are not perfectly positioned, this ideal symmetry is broken and the nonallowed multipoles, normal and skew, appear in the magnetic field. In analyzing the multipoles which arise due to random variations in the sizes and locations of the current blocks, the authors adopt a model analogous to that used for their analysis of the superconducting dipole.

3328 (AD-A–210282/0/XAB) **Effects of normal annealing cycles during IGFET fabrication on initial and radiation-induced gate-insulator defects. Annual progress report, 1 December 1988-7 July 1989.** Walters, M.; Reisman, A. Microelectronics Center of North Carolina, Research Triangle Park, NC (USA). 13 Jul 1989. 14p. (TR–2). Available from NTIS, PC A03/MF A01.

The influence of three typical annealing cycles normally used in IGFET processing on as-fabricated and post-irradiated gate oxide defect levels was studied. These cycles were: (1) post-oxidation for 5 minutes at 1000 C in argon, (2) post-polysilicon for 30 minutes at 500 C in forming gas, and (3) post-metallization for 30 minutes at 400 C in hydrogen. Gate oxide defects were characterized using optically assisted electron injection of n-channel polysilicon-gated IGFET devices. It was found that the presence or absence of any of the three annealing cycles during the processing had no effect on measured interface state and bulk oxide defect levels in the as-fabricated devices. Following exposure to Al K (alpha) X-ray radiation, the increase in the number of bulk oxide defects was found to be independent also of the presence or absence of any of the cycles. The interface state density was found to increase only slightly following irradiation, with the smallest increase occuring for devices which had received either the post-oxidation or the post-metal anneal. These results may indicate that other high temperature steps which are present in IGFET processing, as well as the use of different electrode materials than were employed in the earlier studies overshadow the effects of the three annealing cycles studied, and therefore, the entire processing sequence of IGFET fabrication must be considered in determining the factors which influence gate insulator defect levels and susceptibility to ionizing radiation.

3329 (AD-A–211248/0/XAB) **High-efficiency fast-neutron detector. Memorandum report.** August, R.A.; Phillips, G.W.; Cutchin, J.H. Naval Research Lab., Washington, DC (USA). 2 Aug 1989. 24p. (NRL-MR–6518). Available from NTIS, PC A03/MF A01.

This report researches a concept for a high-efficiency detector of fast neutrons (several MeV), using solid-state charged-particle detectors overlaid with thick disks (about mm) of ^{238}U. Experiments show a significant count rate in the mockup when exposed to a fast-neutron flux, but it appears insensitive to the slow/thermal neutron flux. Preliminary results indicate a system with an efficiency on the order of at least 5% could be developed.

3330 (DOE/ER/40224–87) **[Theory of elementary particle studies in weak interaction and grand unification and studies in accelerator design]: Annual progress report.** Oregon Univ., Eugene, OR (USA). [1989]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-85ER40224. Order Number DE90003324. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses: SLD detector; superconducting super collider; SICAPO; tau-charm factory proposal; beamstrahlung; Mark II small angle monitors; and Mark II data analysis. (LSP)

3331 (DOE/ER/40224–129) **Silicon calorimetry for the SSC[Superconducting Supercollider].** Bertrand, C.; Borchi, E.; Brau, J.E.; Bruzzi, M.; Bugg, W.M.; Furuno, K.; Lamarche, F.; Leroy, C.; Lindstroem, G.; Mazzoni, S.; Ohsugi, T.; Rancoita, P.G.; Russ, J.; Vismara, L. Oregon Univ., Eugene, OR (USA). Inst. of Theoretical Science. 8 Sep 1989. 43p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-85ER40224. (CONF-890379–16: Workshop on calorimetry for the SSC, Tuscaloosa, AL (USA), 13-17 Mar 1989). Order Number DE90003331. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

SSC experiments will rely heavily on their calorimeters. Silicon calorimetry, which has been introduced in recent years as a useful technology, has many attractive characteristics which may make it a viable option for consideration. The many attractive properties of silicon detectors are reviewed. The relevant present day applications of large areas of silicon detectors are summarize to illustrate the emerging use. The troublesome issue of radiation damage in a high luminosity environment like the SSC is considered with a summary of much of the recent new measurements which help clarify this situation. A discussion of the electronics and a possible mechanical configuration is presented, followed by a summary of the outstanding R and D issues. 31 refs., 11 figs., 3 tabs.

3332 (DOE/ER/40389–57) **The low energy frontier in high energy particle physics.** Martoff, C.J. Temple Univ., Philadelphia, PA (USA). Dept. of Physics. [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER40389. (CONF-8905187–5: WEIN '89: international symposium on weak and electromagnetic interactions in nuclei, Montreal (Canada), 15-19 May 1989). Order Number DE90002567. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A number of interesting particle physics experiments can be performed if one can accurately measure KeV recoil atoms from certain low-energy scattering processes in massive active target/ detectors. The physics and experimental requirements of these experiments are discussed. The requirements of energy threshold

below 1 KeV and energy resolution of some tens of eV are difficult to achieve with conventional detectors. A proposed cryogenic particle detector technique is described, based on detection of quasiparticles in superconducting metal absorbers, and its theoretical noise characteristics computed. An experimental program is underway to develop the superconducting quasiparticle spectrometer detectors, and to measure ionization energy loss of KeV recoil atoms in solids. 33 refs., 2 figs.

3333 (FNAL-TM–1620) **Conceptual design report for a superconducting coil suitable for use in the large solenoid detector at the SSC [Superconducting Super Collider].** Fast, R.W.; Grimson, J.H.; Krebs, H.J.; Kephart, R.D.; Theriot, D.; Wands, R.H. Fermi National Accelerator Lab., Batavia, IL (USA). 15 Sep 1989. 93p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE90001797. Available from NTIS, PC A05/MF A01; OSTI; INIS.

The conceptual design of a large superconducting solenoid suitable for a magnetic detector at the Superconducting Super Collider (SSC) was done at Fermilab. The magnet will provide a magnetic field of 1.7 T over a volume 8 m in diameter by 16 m long. The particle-physics calorimetry will be inside the field volume and so the coil will be bath cooled and cryostable; the vessels will be stainless steel. Predictability of performance and the ability to safely negotiate all probable failure modes, including a quench, are important items of the design philosophy. Our conceptual design of the magnet and calorimeter has convinced us that this magnet is a reasonable extrapolation of present technology and is therefore feasible. The principal difficulties anticipated are those associated with the very large physical dimensions and stored energy of the magnet. 5 figs.

3334 (INIS-BR–1685) **Computerized tomographic in nondestructive testing.** Lopes, R.T. Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Posgraduacao de Engenharia. 1988. 156p. (In Portuguese). Order Number DE90608804. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

The process of computerized tomography has been developed for medical imaging purposes using tomographs with X-ray, and little attertion has been given to others possibles applications of technique, because of its cost. As an alternative for the problem, we constructed a Tomographic System (STAC-1), using gamma-rays, for nonmedical applications. In this work we summarize the basic theory of reconstructing images using computerized tomography and we describe the considerations leading to the development of the experimental system. The method of reconstruction image implanted in the system is the filtered backprojection or convolution, with a digital filters system to carried on a pre-filtering in the projections. The experimental system is described, with details of control and the data processing. An alternative and a complementary system, using film as a detector is shown in preliminary form . This thesis discuss and shows the theorical and practical aspects, considered in the construction of the STAC-1, and also its limitations and apllications.

3338 (INIS-mf–12013, pp. 28-29) **Developments at the Q3D spectrograph.** Kruechten, B. v.; Rech, M.; Rychel, D.; Schuermann, B.; Schwan, A.; Speer, J.; Toews, H.; Wiedner, C.A. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

In 1987 the Q3D spectrograph was used for spectroscopy with α-particles. A position sensitive parallel plate detector was successfully commissioned. Wide pitch (8.5 mm) Si-strip detectors have been employed and their deterioration with the dose of different heavy ions has been investigated. For RBS-studies an array of Si-strip detectors with 100 μm pitch and 25 cm length is planned. First trials with a 3 MeV $^4He^+$ beam yielded a system resolution - accelerator and spectrograph - of 1.1 keV (FWHM). (orig.).

3339 (INIS-mf–12013, pp. 29-31) **Development of a 4π-detector system to be used at the SIS/ESR accelerator of the GSI/Darmstadt.** Pelte, D. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)); Trzaska, M.; Wessels, J.; Winkler, U.; Wolfenstaetter, H. 4pi Collaboration. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

An essential part of the 4π-detection system for the new SIS/ESR accelerator consists of the central drift chamber which will detect mainly protons and pions with multiplicities m<100. Monte Carlo models are developed to study the track distribution in the chamber and possible methods of track reconstruction. The construction of a small-size test chamber and the data readout system has been started. (orig.).

3340 (INIS-mf–12013, pp. 32-33) **SI ring counters for detection of evaporation residues.** Faschingbauer, U. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

An annular silicon strip detector (thickness 300 μm, inner diameter 4.6 cm, outer diameter 10 cm) designed to measure evaporation residues in the Heidelberg Crystal Ball was investigated with a Cf-252 source to examine energy resolution, cross-talk and a high counting rate with an economized electronic readout. A new feature is the detector's backsided readout. (orig.).

3341 (INIS-mf–12013, pp. 33-35) **Construction of a new 4π parallel plate detector for the Crystal Ball.** Klatt, C. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Schulz, E.; Habs, D.; Gerl, J.; Helmolt, U. v.; Korten, W.; Schwalm, D. In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The present status of the new data acquisition system for the Crystal Ball is discussed. (orig.).

3344 (INIS-mf–12013, pp. 79) **Investigation of monoenergetic pair conversion.** Kramp, J. (Heidelberg Univ. (Germany, F.R.). Physikalisches Inst.); Schwalm, D.; Backe, H.; Habs, D. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

An experiment to measure the monoenergetic pair-conversion decay of fully stripped $^{59}Co(3^-/2)$ is being prepared. The solenoid transport system for positron detection was built up at the postaccelerator facility and optimized according to numerical simulations. (orig.).

3345 (INIS-mf–12013, pp. 104-107) **Collision-radiation recombination.** Baumann, W. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Habs, D.; Welti, K.; Zwickler, S.; Berger, J.; Krause, P.; Neumann, R.; Schwalm, D.; Schuch, R.; Liesen, D. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The possibilities of investigating the electron-ion-recombination in the cooler-section of the TSR are discussed. The relevance of three-body collisional-radiative processes is pointed out. The proposed techniques to detect the charge changed ions and the X-rays from the radiative capture are described. (orig.).

3346 (INIS-mf–12013, pp. 122-124) **Development of an electron spectrometer for the HELIOS heavy ion experiment at CERN.** Breskin, A.; Chechik, R.; Drees, A.; Fischer, P.; Fraenkel, Z.; Glaessel, P.; Lamade, G.; Ries, H.; Sauvage, D.; Schoen, A. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

For the readout of proportional chambers two new readout schemes have been developed, an optical readout and a pad readout. Both methods were tested at the UV detector of a RICH prototype detector in the electron beam of the CERN PS. High efficiency, good spatial resolution, and reliable operation of both schemes were found. (orig.).

3347 (INIS-mf–12013, pp. 134-138) **Gallium solar neutrino experiment (project 'GALLEX').** Burkert, E.; Breitenbach, M.; Doerflinger, D.; Hampel, W.; Heusser, G.; Kaether, D.; Kiko, J.; Kirsten, T.; Lenzing, A.; Moegel, P. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The GALLEX-Project for solar neutrino detection proceeds as planned. Particular milestones achieved in 1987 are: The construction of the 3-storey Process-Building. The construction of the 2-storey Counting-Building. The completion of the hall A-environemnt, all in the Gran Sasso Underground Laboratory in Assergi, Italy. The near completion of the galliumchloride production plant in Gramercy, Louisiana. The completion of the germanium-extraction pilot plant in KFK Karlsruhe. The optimalization of low level proportional counters. The verification of particularly low background rates in the preliminary Gran Sasso counting station. The realization of ^{50}Cr enrichment for use in the ^{51}Cr-source experiment performance test. (orig.).

3348 (INIS-mf–12013, pp. 142) **CoMA, an instrument for the detailed in-situ analysis of collected cometary particulates.** Kissel, J.; Fechtig, H.; Jessberger, E.K.; Krueger, F.R.; Niemczyk, N.; Schaefer, G.; Zscheeg, H. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The proposal for CoMA, a pulsed time-of-flight SIMS instrument to be flown onboard CRAF to rendezvous with a comet, had been accepted by NASA in October 1986. After several attempts it seems that funding by BMFT for the instrument pre-development phase can be obtained. Apart from that we made first essential progress in producing the primary ion pulses from an indium liquid metal ion source. Those pulses are needed to operate CoMA. (orig.).

3349 (INIS-mf–12013, pp. 142-143) **Analysis of surface composition of a Martian moon with the instrument LIMA-D onboard the Mars mission PHOBOS.** Kissel, J.; Jessberger, E.K.; Krueger, F.R.; Niemczyk, N.; Schaefer, G.; Vollmer, E. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

First results obtained with the MPI supported laboratory setup of a long distance time-of-flight mass-spectrometer confirm the applicability of the method to use laser-ionisation for remote analysis of small celestial bodies. After ratification of the treaty on Soviet-German cooperation in science, a grant by the BMFT enables us to participate in the LIMA-D flight instrument. We have now improved the operating system for the instrument and the data collection algorithm. In the laboratory we set up a unit to check the response of a multiplier system to complex input currents as they occur e.g. in the case of a mass spectrum. As laser-ionisation is a highly nonlinear process, where ion yields depend on a lot of parameters, an extensive laboratory study, in which we cooperate with colleagues from IKI in Moscow, FMI in Helsinki, and the University of Kaiserslautern, shall give actual ion yields and ion energies for the range of laser and focus conditions used in the PHOBOS flyby configuration. These data shall be available when the flyby takes place in December 1989. (orig.).

3350 (INIS-mf–12013, pp. 156-158) **Technical and methodical developments.** Arnold, F.; Fabian, R.; Helleis, F.; Hoffmann, J.; Knop, G.; Krieger, A.; Moehler, O.; Mueckler, P.; Pfeilsticker, K.; Preissler, B. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The laboratory studies focus on technical improvements of the new balloon-borne ACIMS (active chemical ionization mass spectrometry) -probe and basic investigations on the ACIMS method. In addition, the construction of a triple quadrupole mass spectrometer for ion fragmentation studies was started. (orig.).

3351 (INIS-mf–12013, pp. 158-159) **Energy calibration and quantitative analysis with ESCA.** Bednar, F.; Jessberger, E.K. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

The installation of an ESCA (Electron Spectroscopy for Chemical Analysis) apparatus for studies complimentary to our SIMS analyses was continued. The energy-calibration of the ESCA-spectrometer disclosed problems in the stability of the analyzer sweep voltage which were solved by connecting the digital-analog-converter to the same ground potential as the ESCA-electronics. Afterwards calibration was performed using a copper and a gold target. The analysis of two more complex samples confirmed the accuracy of the calibration. The precision of the energy-scale is better than +-0.2 eV. (orig.).

3352 (INIS-mf-12013, pp. 159) **Calculations on a third order energy focusing time-of-flight mass spectrometer.** Vollmer, E.; Kissel, J. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

In time-of-flight mass spectrometry the mass resolution can be improved by the use of energy focusing electric fields. Calculations on the design of a third order energy focusing instrument have been performed. (orig.).

3353 (LA–11702-MS) **A computer study of source-detector geometries proposed for the induced-emission tomography of transuranic elements.** Estep, R.J. Los Alamos National Lab., NM (USA). Nov 1989. 24p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE90002830. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We describe two unusual source-detector geometries that are proposed for the tomographic imaging of transuranic elements using beam interrogation. Both geometries demonstrate a high inherent imaging power. A proposed bremsstrahlung beam imaging method proves to be feasible for imaging the important uranium isotopes. Open geometry imaging methods, which use uncollimated detectors, require high-quality data to produce faithful images. 15 refs., 14 figs., 5 tabs.

3354 (LBL–27813) **Improved charge collection of the buried p-i-n a-Si:H radiation detectors.** Fujieda, I.; Cho, G.; Conti, M.; Drewery, J.; Kaplan, S.N.; Perez-Mendez, V.; Qureshi, S.; Street, R.A. Lawrence Berkeley Lab., CA (USA). Sep 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-891087–10: IEEE nuclear science symposium and exhibits, San Francisco, CA (USA), 25-27 Oct 1989). Order Number DE90002669. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Charge collection in hydrogenated amorphous silicon (a-Si:H) radiation detectors is improved for high LET particle detection by adding thin intrinsic layers to the usual p-i-n structure. This buried p-i-n structure enables us to apply higher bias and the electric field is enhanced. When irradiated by 5.8 MeV α particles, the 5.7 μm thick buried p-i-n detector with bias 300V gives a signal size of 60,000 electrons, compared to about 20,000 electrons with the simple p-i-n detectors. The improved charge collection in the new structure is discussed. The capability of tailoring the field profile by doping a-Si:H opens a way to some interesting device structures. 17 refs., 7 figs.

3355 (N–89-18288, pp. 182-183) **In situ XRF and gamma ray spectrometer for Mars sample return mission.** Lo, I.Y. (Cornell Univ., Ithaca, NY (USA)); Trombka, J.I.; Evans, L.G.; Squyres, S.W. Lunar and Planetary Inst., Houston, TX (USA). 1988. (NASA-CR–183337;NAS–1.26:183337;LPI-TR–88-07;CONF-8711303–: Workshop on Mars sample return science, Houston, TX (USA), 16 Nov 1987). In *Workshop on Mars Sample Return Science.* Available from NTIS, PC A09/MF A01.

A combined in situ X-ray fluorescence (XRF) and passive gamma ray spectrometer instrument is proposed for the chemical elemental analysis of various Martian surfaces and samples. The combined instrument can be carried on board a rover. The passive gamma ray or the neutron excited gamma ray system would be used to determine the elemental composition of the Martian surface while the rover is in motion. The XRF system would be used to perform analysis either on the Martian surface or on collected samples when the rover is stationary. The latter function is important both in cataloging the collected samples and in the selection of samples to be returned to earth. For both systems, data accumulation time would be on the order of 30 minutes. No sample preparation would be necessary.

3356 (RCNP-P–105, pp. 103-109) **Measurement of (n,p) reactions using the spectrograph DUMAS and an apparatus for high resolution (n,p) experiments at intermediate energy.** Matsuoka, N. (Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics). Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. Jul 1989. (In Japanese). In *Proceedings of the workshop on neutron scattering and neutron reactions.* Order Number DE90705941. Available from NTIS (US Sales Only), PC A06/MF A01.

A test experiment of (n,p) reactions was carried out at En$\simeq$63 MeV using the spectrograph DUMAS at RCNP. The experimental method and preliminary results are described. Examinations were made on the apparatus for high resolution (n,p) experiments at intermediate energy using the magnetic spectrograph. A possible method to produce a high resolution neutron beam is described mainly. (author).

3357 (SLAC-PUB–5066) **The digital data acquisition chain and the cosmic ray trigger system for the SLD Warm Iron Calorimeter.** Benvenuti, A.; Piemontese, L.; Calcaterra, A.; De Sangro, R.; De Simone, P.; Burrows, P.N.; Cartwright, S.L.; Gonzales, S.; Lath, A.; Schneekloth, U.; Williams, D.C.; Yamartino, J.M.; Bacchetta, N.; Bisello, D.; Castro, A.; Galvagni, S.; Loreti, M.; PescarStanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 8p. Sponsored by U.S. DOE Energy Research; National Institute for Nuclear Physics, Italy (Istituto Nazionale di Fisica Nucleare - INFN). DOE Contract AC03-76SF00515;AC02-76ER03069;AC02-76ER00881. (CONF-8905194–6: 4. Pisa meeting on advanced detectors: frontier detectors from frontier physics, La Biodola (Italy), 21-26 May 1989). Order Number DE90000943. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The entire data-acquisition chain, from the custom-made front-end electronics to the Fastbus readout and data-reduction module, for the digital readout of the SLD limited streamer tube Warm Iron Calorimeter and Muon Identifier is described. Also described is a Fastbus Cosmic Logic Unit being developed to achieve the capability of reading cosmic ray events, also during the inter-crossing time, for apparatus monitoring and calibration purposes. 9 refs., 9 figs.

3358 **Electronically focused time-of-flight powder diffractometers at the Intense Pulsed Neutron Source.** Jorgensen, J.D. (Argonne National Lab., IL (USA)); Faber, J. Jr.; Carpenter, J.M.; Crawford, R.K.; Haumann, J.R.; Hitterman, R.L.; Kleb, R.; Ostrowski, G.E.; Rotella, F.J.; Worlton, T.G. *Journal of Applied Crystallography (Denmark),* 22(4): 321-333 (1 Aug 1989). DOE Contract W-31-109-ENG-38.

Two time-of-flight powder diffractometers have operated at the Intense Pulsed Neutron Source (IPNS) since August 1981. These instruments use dedicated microcomputers to focus time-of-flight events so that data from different detectors can be summed into a single histogram. Thus, large multidetector arrays can be employed at any scattering angle from 12 to 157^0. This design permits data to be collected over a uniquely wide range of d spacings, while maintaining high resolution and count rates. The performance of the two instruments is evaluated by analyzing data from a standard Al_2O_3 sample by the Rietveld method. These instruments provide the capability for moderate- to high-resolution measurements with the duration of a typical run being a few hours. (orig.).

3359 **Neutron range spectrometer.** Manglos, S.H. To Dept. of Energy, Washington, DC. USA Patent 4,837,442. 6 Jun 1989. Filed date 10 Mar 1988. USA Patent Application 7,166,581. Int. Cl. G01T 3/00. 6p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

In this patent a neutron range spectrometer and method for determining the neutron energy spectrum of a neutron emitting source are disclosed. Neutrons from the source are collimated along a collimation axis and a position sensitive neutron counter is disposed in the path of the collimated neutron beam. The counter determines positions along the collimation axis of interactions between the neutrons in the neutron beam and a neutron-absorbing material in the counter. From the interaction positions, a computer analyzes the data and determines the neutron energy spectrum of the neutron beam.

(MODFETs): Threshold voltage. Technical report. Krantz, R.J.; Bloss, W.L.; O'Loughlin, M.J. Aerospace Corp., El Segundo, CA (USA). Electronics Research Lab. 15 Jun 1989. 40p. (TR–0089(4925-07)-3). Available from NTIS, PC A03/MF A01.

The effects of high-energy neutrons of fluences approaching 1 x 10^{15} power per sq cm on MODFETs were studied. Neutron-induced threshold voltage shifts are described by application of a finite-temperature strong-inversion, depletion-layer, charge-control model. The results of this model show that the neutron-induced threshold voltage is a consequence of electron trapping the GaAs layer near the AlGaAs/GaAs interface. This allows a convenient parameterization of the neutron degradation by accounting for these trapped electrons as effective acceptors', defining an effective accetor introduction rate, and applying the charge control model to describe the threshold voltage. Our analysis shows that neutron degradation in these AlGaAs/GaAs heterostructures is dominated by the change in the depletion-layer charge and the shift in the Fermi level with neutron fluence. The dominant mechanisms are shown to depend on GaAs material parameters, only. The contribution due the AlGaAs layer carrier removal is <3% of the total threshold voltage shift.

3361 (N–89-28454) **Interplanetary particle environment. Proceedings of a conference.** Feynman, J.; Gabriel, S. Jet Propulsion Lab., Pasadena, CA (USA). Apr 1988. 165p. (NASA-CR–185461;JPL-PUBL–88-28;NAS–1.26:185461;CONF-8703326–: Conference on interplanetary particle environment, Pasadena, CA (USA), 16-17 Mar 1987). Available from NTIS, PC A08/MF A01.

A workshop entitled the Interplanetary Charged Particle Environment was held at the Jet Propulsion Laboratory (JPL) on March 16 and 17, 1987. The purpose of the Workshop was to define the environment that will be seen by spacecraft operating in the 1990s. It focused on those particles that are involved in single event upset, latch-up, total dose and displacement damage in spacecraft microelectronic parts. Several problems specific to Magellan were also discussed because of the sensitivity of some electronic parts to single-event phenomena. Scientists and engineers representing over a dozen institutions took part in the meeting. The workshop consisted of two major activities, reviews of the current state of knowledge and the formation of working groups and the drafting of their reports.

3362 (N–89-28454, pp. 35-47) **The effects of high energy particles on planetary missions.** Robinson, P.A. Jr. Jet Propulsion Lab., Pasadena, CA (USA). Apr 1988. (NASA-CR–185461;JPL-PUBL–88-28;NAS–1.26:185461;CONF-8703326–: Conference on interplanetary particle environment, Pasadena, CA (USA), 16-17 Mar 1987). In *Interplanetary particle environment. Proceedings of a conference.* Available from NTIS, PC A08/MF A01.

Researchers review the background and motivation for the detailed study of the variability and uncertainty of the particle environment from a space systems planning perspective. The engineering concern raised by each environment is emphasized rather than the underlying physics of the magnetosphere or the sun. Missions now being planned span the short term range of one to three years to periods over ten years. Thus the engineering interest is beginning to stretch over periods of several solar cycles. Coincidentally, detailed measurements of the environment are now becoming available over that period of time. Both short term and long term environmental predictions are needed for proper mission planning. Short term predictions, perhaps based on solar indices, real time observations, or short term systematics, are very useful in near term planning – launches, EVAs (extravehicular activities), coordinated observations, and experiments which require the magnetosphere to be in a certain state. Long term predictions of both average and extreme conditions are essential to mission design. Engineering considerations are many times driven by the worst case environment. Knowledge of the average conditions and their variability allows trade-off studies to be made, implementation of designs which degrade gracefully under multi-stress environments.

Available from NTIS (US Sales Only), PC A03/MF A01.

This paper summarizes the results of a study on beam diagnostics, using carbon wire scanners and optical transition radiation (DTR) monitors. The main consideration consists in the material selection, taking their thermal properties and their effect on the beam into account.

3364 (CONF-8602126–) **UC accelerator mass spectrometry 1: Proceedings.** Ericson, J.E.; Taylor, R.E. (eds.). Lawrence Livermore National Lab., CA (USA). 25 Aug 1989. 76p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. From Mass spectrometry conference; Irvine, CA (USA); 15 Feb 1986. Order Number DE90002222. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This paper is meant to explore potential new applications of accelerator mass spectrometry (AMS). The proceedings of the Third International Symposium on Accelerator Mass Spectrometry illustrate the growing applications in earth science, archaeology, geophysics, astrophysics, oceanography and nuclear physics. The application of AMS promises to open up new lines of investigation in other disciplines as new problems and materials are examined. The overall detection and milligram size of AMS ^{14}C samples offer specific advantages over conventional proportional gas counting (PGC) and liquid scintillation counting (LSC), although there are inherent limitations imposed by accuracy, age limits and costs. There are a number of problems in various disciplines that can be addressed using AMS technology.

3365 (CONF-8907113–13) **The current status of two-dimensional electrophoresis in germ cell mutation research.** Giometti, C.S. Argonne National Lab., IL (USA). [1989]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 5. international conference on environmental mutagens; Cleveland, OH (USA); 10-15 Jul 1989. Order Number DE90002191. Available from NTIS, PC A02/MF A01 - OSTI.

Previous research demonstrated that isoelectric focusing followed by sodium dodecyl sulfate (SDS) polyacrylamide gel electrophoresis can be used to resolve hundreds of proteins from a single sample into a pattern of well-defined polypeptide spots. The possible application of this two-dimensional electrophoresis (2DE) technique to the detection of heritable mutations was recognized and demonstrated using mouse tissues. The studies demonstrated that actual implementation of 2DE for large genetic studies, however, required rigorous pattern reproducibility and methods of extracting numerical data from the patterns. The development of equipment for multiple parallel 2DE analyses and of computer software for the analysis of the resulting 2DE patterns during the 10 years since the first description of 2DE have provided the necessary tools for the application of 2DE to genetic studies. We are currently using inbred strains of mice to study the mutation detection capability of 2DE. The levels of sample and pattern reproducibility required for detection of significant changes in protein expression are being defined; the detection of mutations induced by different classes of mutagen (e.g., those causing large versus small alterations in DNA) is being assessed; and the population of proteins (and therefore genes) monitored by 2DE analysis is being characterized. 19 refs., 3 figs.

3366 (CONF-8910216–3) **Cavitation-controlled ultrasonic agitator.** Sheen, S.H.; Lawrence, W.P.; Raptis, A.C. Argonne National Lab., IL (USA). Oct 1989. 5p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. From Ultrasonics symposium; Montreal (Canada); 3 Oct 1989. Order Number DE90002773. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

High-intensity ultrasound generally produces nonlinear acoustic cavitation and streaming in liquids. The ultrasonic energy required to cause cavitation and streaming in a liquid depends on the physical properties of the liquid, e.g., surface tension, viscosity, and entrained gases. Both cavitation and streaming generate acoustic noise whose signatures may be used to distinguish the stage of agitation and thus allow the process to be controlled. An ultrasonic

agitator has been designed for application in a confined area with a high-temperature, high-pressure, and corrosive environment. Control of this agitator is based on the detection of noise levels and subharmonics produced during cavitation and streaming. Noise signatures of agitation in different liquids and in liquids with particles have been determined, and discussed. 6 refs., 6 figs.

3367 (N–89-17298, pp. 43-51) **Development of a high temperature thin film static strain gage.** Hulse, C.O. (Pratt and Whitney Aircraft, East Hartford, CT (USA)); Bailey, R.S.; Grant, H.P.; Przybyszewski, J.S. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objective is to develop a new thin film resistance strain gage system which will be suitable for use inside gas turbine engines on blades or vanes at temperatures up to 1250 K. These gages are to be capable of making strain measurements to plus or minus 2000 microstrain with total errors of no more than plus or minus 10 percent during a 50 hour period. In addition to survival and stability in this hostile environment, attaining a low temperature coefficient of resistance, of the order of 20 ppm/K or less, is an important goal. This requirement arises from the presently unavoidable uncertainties in the measurement of exact temperatures inside gas turbine engines for use in making corrections for apparent strain.

3368 (N–89-17298, pp. 53-75) **Elevated temperature strain gages.** Lei, J.F.; Shaarbaf, M.; Brittain, J.O. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The objective is to study the electrical resistance of materials that are potentially useful as resistance strain gages at 1000 C. A set of criteria were set and used to select strain gage candidate materials that are electrically stable and reproducible at all temperatures up to 1000 C. For the experimental phase of this research, the electrical resistance change with temperature of three groups of materials (solid solution alloys, transition metal carbides, and semiconductors) were studied with the intention of identifying materials with low temperature coefficient of resistance and low resistance drift rate at 1000 C. A preliminary study of the gage factor on one of the best candidate materials, B sub 4 C, was also undertaken. The results of these investigations are presented.

3369 (N–89-17298, pp. 77-79) **Progress on a PdCr wire strain gage.** Englund, D.R. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Oct 1987. (NASA-CP–2493;E–3745;NAS–1.55:2493;CONF-8710466–: Workshop on turbine engine hot section technology, Cleveland, OH (USA), 20-21 Oct 1987). In *Turbine Engine Hot Section Technology, 1987.* Available from NTIS, PC A20/MF A01.

The principal activity under the HOST effort to improve the state of the art in high temperature static strain measurement has been a contract under which a palladium-chromium (PdCr) alloy was developed. The contract effort is continuing with the goal of developing a thin film high temperature static strain gage system. In addition to this effort, researchers contracted with Battelle-Columbus Laboratories to draw the PdCr allow into wire while researchers at Lewis worked to gain experience with this alloy as a wire strain gage.

Report for January 1975-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 132p. Available from NTISPC N01/MF N01.

Supersedes PB–88-862651.

This bibliography contains citations concerning the utilization of semiconductor devices as gas detectors. Topics include performance and operating characteristics of specific devices, materials descriptions, design considerations, and applications in pollution detection. Fabrication techniques are also considered. (This updated bibliography contains 228 citations, 75 of which are new entries to the previous edition.)

3371 (PNL-SA–17257) **Combined capillary electrophoresis and electrospray ionization mass spectrometry.** Smith, R.D.; Loo, J.A.; Barinaga, C.J.; Edmonds, C.G.; Udseth, H.R. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 9p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-8909252–1: 14. annual Japanese Society for Biomedical Mass Speculation meeting, Nagoya (Japan), 28-30 Sep 1989). Order Number DE90001903. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The special capabilities of the capillary electrophoresis electrospray ionization-mass spectrometer interface for the analysis of peptides and proteins with molecular weights extending to in excess of 100 kilodalton are demonstrated. The dynamic combinations of both capillary zone electrophoresis and capillary isotachophoresis with electrospray ionization are illustrated for mixtures of peptides and proteins. The potential extension of these methods for determination of the primary structure (sequence) of proteins using tandem mass spectrometry is shown to be facilitated by the high charge state of ions produced by the electrospray interface. The relevance of these results for advances in analytical biochemistry is discussed. 24 refs., 4 figs.

3372 (UCRL–53935) **Optically based potassium sensor.** Roe, J.N. Lawrence Livermore National Lab., CA (USA). Jul 1989. 139p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90001793. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

A new colorimetric assay was developed for potassium ions in neutral aqueous solution. The method is based on the change in optical absorbance of the hydrophobic indicator 7-(n-decyl)-2-methyl-4-(3′, 5′-dichlorophen-4′-one)- indonaphthl-l-ol (MEDPIN). Formation of a ternary complex between a valinomycin-K^+ pair, and the anionic form of MEDPIN in a lipophilic phase resulted in the appearance of a strong blue absorption band. Potassium selectivity was achieved by use of the ion selective ionophore, valinomycin. The intensity of the blue absorption band (between 600 and 650 nm) was dependent on aqueous cation concentration. The spectroscopic properties of MEDPIN and the MEDPIN/valinomycin/K^+ interaction were measured in various solvents, at varying MEDPIN concentration, valinomycin concentration, and at different pH values in the aqueous phase. The assay was used to develop a potassium sensitive fiberoptic sensor that would allow the measurement of potassium ion concentrations in human blood in vivo. The operating characteristics of the sensor were determined. 110 refs., 18 figs., 7 tabs.

3373 **Fiber-optic wavelength-division multiplexing and demultiplexing using volume holographic gratings.** Moslehi, B. (Physical Optics Corporation, 2545 West 237th Street, Suite B, Torrance, California 90505 (US)); Harvey, P.; Ng, J.; Jannson, T. *Optics Letters (USA),* 14(19): 1088-1090 (1 Oct 1989).

We present theoretical and experimental results of a novel fiber-optic wavelength-division multiplexing (WDM) design employing a broadband (>150-nm) dichromated gelatin volume holographic grating operating in a reflective Littrow configuration with on-axis optics, a single lens, and one fiber array. This configuration can achieve better than −1.5-dB insertion loss and −40-dB cross talk for a 6-channel system and −2.5-dB insertion loss and −20-dB cross talk for a 12-channel system with 15-nm channel spacing. For an experimental 4-channel WDM unit we measured better than −1.5-dB insertion loss for all channels and less than −32-dB cross talk. This design can provide cost and performance benefits for local area network communication applications.

3374 **Computer control of the tunnel barrier width for the scanning tunneling microscope.** Piner, R. (Purdue University, Department of Physics, West Lafayette, Indiana 47907 (US)); Reifenberger, R. *Review of Scientific Instruments (USA),* 60(10): 3123-3127 (Oct 1989).

The design of a computer system which directly controls tunnel barrier width in a scanning tunneling microscope (STM) is described. This capability allows STM scans to be performed at a speed which is automatically determined by the roughness of the

surface under study. The computer system is inexpensive and designed with readily available components for the VME bus.

3375 **Double rotor for solid-state NMR.** Samoson, A. (Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, 1 Cyclotron Road, Berkeley, California 94720 and Chemistry Department, University of California, Berkeley, California 94720 (US)); Pines, A. *Review of Scientific Instruments (USA),* 60(10): 3239-3241 (Oct 1989). DOE Contract AC03-76SF00098.

An NMR double-rotation probe providing for reorientation of a sample around two axes is described, and the key design features for low-friction motion are discussed. By means of double rotation, second-order broadening is averaged away, thus enhancing the resolution of spectra for quadrupole nuclei in solid-state NMR.

3376 **A simple implementation of a power supply for constant phototube current in light modulation spectroscopy.** Jellison, G.E. Jr. (Solid State Division, Oak Ridge National Laboratory, P.O. Box 2008, Building 2000, MS 6056, Oak Ridge, Tennessee 37831-6056 (US)); Modine, F.A. *Review of Scientific Instruments (USA),* 60(10): 3345-3346 (Oct 1989). DOE Contract AC05-84OR21400.

A simple implementation of a commercially available high-voltage power supply is described whereby the power supply can be used for voltage biasing of a photomultiplier tube operating either in a constant dynode voltage or in a constant output current mode. In the constant current mode, low frequency fluctuations in the current are suppressed without attenuation of a high frequency signal. Both the phototube output current and the dynode voltage can be set by external voltages in the range from −10 to +10 V, making computer control easy with standard digital-to-analog converters.

3377 **Use of a charge-coupled device camera for broadband coherent anti-Stokes Raman scattering measurements.** Rakestraw, D.J. (Sandia National Laboratories Combustion Research Facility, Livermore, California 94551 (US)); Lucht, R.P.; Dreier, T. *Applied Optics (USA),* 28(19): 4116-4120 (1 Oct 1989).

The use of an unintensified charge-coupled device (CCD) camera for the acquisition of broadband CARS signals is demonstrated. The CCD camera offers significant advantages compared to intensified, linear photodiode array (PDA) detectors that are generally used for broadband CARS measurements. These advantages include higher spectral resolution and improved instrument function, larger dynamic range, and a 2-D format.

4404 Well Logging Instrumentation

3378 (LA-UR–89-3498) **MCNP [Monte Carlo Neutron Photon] capabilities for nuclear well logging calculations.** Forster, R.A.; Little, R.C.; Briesmeister, J.F. Los Alamos National Lab., NM (USA). [1989]. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891087–8: IEEE nuclear science symposium and exhibits, San Francisco, CA (USA), 25-27 Oct 1989). Order Number DE90002404. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Los Alamos Radiation Transport Code System (LARTCS) consists of state-of-the-art Monte Carlo and discrete ordinates transport codes and data libraries. The general-purpose continuous-energy Monte Carlo code MCNP (Monte Carlo Neutron Photon), part of the LARTCS, provides a computational predictive capability for many applications of interest to the nuclear well logging community. The generalized three-dimensional geometry of MCNP is well suited for borehole-tool models. SABRINA, another component of the LARTCS, is a graphics code that can be used to interactively create a complex MCNP geometry. Users can define many source and tally characteristics with standard MCNP features. The time-dependent capability of the code is essential when modeling pulsed sources. Problems with neutrons, photons, and electrons as either single particle or coupled particles can be calculated with MCNP. The physics of neutron and photon transport and interactions is modeled in detail using the latest available cross-section data. A rich collections of variance reduction features can greatly increase the efficiency of a calculation. MCNP is written in FORTRAN 77 and has been run on variety of computer systems from scientific workstations to supercomputers. The next production version of MCNP will include features such as continuous-energy electron transport and a multitasking option. Areas of ongoing research of interest to the well logging community include angle biasing, adaptive Monte Carlo, improved discrete ordinates capabilities, and discrete ordinates/Monte Carlo hybrid development. Los Alamos has requested approval by the Department of Energy to create a Radiation Transport Computational Facility under their User Facility Program to increase external interactions with industry, universities, and other government organizations. 21 refs.

3379 (AD-A–210499/0/XAB) **Tracking performance evaluation. Final report, 1 December 1987-31 August 1988.** Mori, S.; Chang, K.C.; Chong, C.Y.; Spain, S. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. 7 Dec 1988. 76p. Available from NTIS, PC A05/MF A01.

This final report documents the research conducted at Advanced Decision Systems, sponsored by Lincoln Laboratory, Massachusetts Institute of Technology, under a project entitled, Discrimination Architecture Engineering Support, from 1 December 1987 to 31 August 1988. In this research, simple analytic models were developed for predicting performance of tracking systems in terms of track purity under given tracking environments, in particular, multilayer ballistic missile defense environments concerning tracking surveillance and object discrimination. The main result is a simple analytic model which relates single-scan track-to-measurement association (correlation) performance to two key parameters, object density on sensors' focal planes, and average measurement prediction accuracy by tracks. Predicted track purity is then calculated, through this model, based on given object trajectories and sensor deployment patterns. Extended models were developed to account for false alarms and merged measurements (CSOs) due to limited sensor resolution. Small-scaled but fairly extensive Monte Carlo simulations support the analytic models for predicting track purity developed through this project.

3380 (MLM–3612(OP)) **Simultaneous thermal analysis techniques for characterization of energetic materials.** Whitaker, R.B.; Brown, C.R.; Chang, Cherng; McDaniel, J.A.; Tackett, J.R. EG and G Mound Applied Technologies, Miamisburg, OH (USA). [1989]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-8910157–3: American Defense Preparedness Association's (ADPA) international joint symposium on compatibility of plastics and other materials with explosives, propellants and pyrotechnics, and processing propellants, explosives, and ingredients, Vir Order Number DE90003028. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Simultaneous thermal analysis techniques for characterization of materials has become widespread, with increased availability of instrumentation for such analyses. EG&G Mound has the capability to do simultaneous thermogravimetry/differential scanning calorimetry (TG/DSC) to 825°C, simultaneous thermogravimetry/mass spectrometry (TG/MS) to 1000°C, and high temperature thermogravimetry/differential thermal analysis (TG/DTA) to 2400°C. Advantages of these simultaneous techniques include the exact correlation of TG weight loss data with observed enthalpic transitions and with evolved gas analysis. These thermal analysis techniques have proven to be very useful in the characterization and study of reactions of energetic materials. In this study, several secondary explosives have been examined by TG/DSC to determine weight losses during melting and decomposition, and by TG/MS to identify the decomposition products. Reactions of two pyrotechnic blends were studied by TG/DTA under varying analysis conditions. 5 refs., 3 figs., 3 tabs.

3381 (SAND–89-1437C) **Fast transit gas- and condensed-phase chemistry of energetic materials.** Skocypec, R.D.;

Erickson, K.L.; Renlund, A.M.; Trott, W.M. Sandia National Labs., Albuquerque, NM (USA). [1989]. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8910263–1: JANNAF Combustion Subcommittee meeting, Pasadena, CA (USA), 23-27 Oct 1989). Order Number DE90001656. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An experimental system is being developed to study the fast transient kinetics governing solid-phase decomposition and subsequent interaction with decomposition products. The first phase of this work addresses the decomposition step. The experimental system integrates a thin-film sample configuration with two chemical diagnostic techniques, time-of-flight mass spectrometry and time-resolved infrared spectral photography, and a pulsed-laser heat source. This system is designed to examine both condensed-phase mechanisms and concurrent gas-phase species evolution from samples at temperatures up to 1000°C with microsecond temporal resolution. Tests are underway to demonstrate and assess the use of thin-film samples with the experimental system. Results of these tests, the diagnostic capabilities of the experimental system, and the advantages, preparation and characterization of thin-film samples are presented. 19 refs., 4 figs.

3382 (UCRL–101879) **Burning rates of two cast nitramine explosives using a hybrid closed bomb-strand burner.** Tao, W.C.; Costantino, M.S.; Ornellas, D.L. Lawrence Livermore National Lab., CA (USA). Aug 1989. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890926–3: 9. international symposium on detonation, Portland, OR (USA), Sep 1989). Order Number DE90002785. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The burn rate of two HMX-based cast explosives, RX-08-EL and RX-40-AP, is measured to pressures above 650 MPa using a hybrid closed bomb-strand burner. The hybrid design allows the simultaneous measurement of pressure and regression rate, in each experiment, over a large range of pressures. RX-08-EL is a high performance extrusion cast explosive with low sensitivity, and RX-40-AP is a cast-cured explosive with a mono-modal HMX particle size distribution. Up to 650 MPa, both explosives exhibit a planar burning mechanism with the regression rate obeying the classical aP^n formalism. Upon cycling to 400 MPa, unloading, and re-pressurizing, the RX-08-EL explosive exhibited a significant increase (an order of magnitude) in its burn rate.

3383 (AD-A–207407/8/XAB) **Analysis of fallout prediction codes including the Fallout Assessment system (FAS). Master's thesis.** Gaudette, R.D. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Jan 1989. 107p. (AFIT/GEP/GNE–89M-2). Available from NTIS, PC A06/MF A01.

The purpose was to develop a method to analyze nuclear weapon fallout codes and apply the method to one code as an example. Codes may be evaluated by three methods: (1) comparison of code prediction with data from an actual burst, (2) comparison with an accepted benchmark code, (3) analysis of the degree of approximation of physical laws used in the code was used in this study. Some of the attributes upon which evaluation should be based are: initial cloud model, local fallout activity, activity distribution in cloud particles, source normalization constant k, and the arrival rate of activity on the ground g(t). Of these attributes, many cannot be obtained directly from code output, they must be determined from an analysis of the source code or by consulting the code's author. This thesis discusses the code attributes that must be evaluated, and describes methods for evaluation based on code output. Finally, the analysis techniques are applied to the Defense Nuclear Agency Fallout Assessment System (FAS). It was found that the physics approximations used by FAS are generally good. However the code has a tendency to over-predict the dose rate close to the detonation point by as much as a factor of 25.

3384 (AD-A–210657/3/XAB) **Analysis of forest-fire smoke using satellite imagery. Master's thesis.** De Vries, P.J. Naval Postgraduate School, Monterey, CA (USA). Mar 1989. 81p. Available from NTIS, PC A05/MF A01.

Original contains color plates: All DTIC and NTIS reproductions will be in black and white.

NOAA-9 AVHRR data from 17 and 18 September 1987 were used to perform forest-fire smoke analysis and tracking. The analysis included alignment, subtraction and division of image digital values to produce an Aerosol Particle Size Index (S12) after Frost (1988). S12 provides information about the slope of the aerosol particle size distribution curve and can be used to infer particle-size distribution changes over time. The results provide evidence that the smoke aging process may be successfully studied using satellite imagery, provided careful analysis and removal of background effects are performed.

3385 (AD-A–210663/1/XAB) **Modeling casualties in nuclear warfare. Final report.** Klopcic, J.T.; Watson, D.L. Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab. Jul 1989. 39p. (BRL-MR–3771). Available from NTIS, PC A03/MF A01.

In this report, the authors summarize the casualty criteria currently accepted for the estimation of casualties to the various nuclear environments. For the blast and thermal environments, comparisons are made with criteria currently used in the assessment of conventional weapon casualties. In the area of radiation effects, the report also includes a summary of performance degradation methodology developed in the DNA Intermediate Nuclear Dose Program and an indication of its relationship to the most recent radiation casualty criteria. Finally, the report concludes with a discussion of the application of these casualty criteria and models in nuclear warfare simulations.

3386 (AD-A–210737/3/XAB) **Engineering Assignment 5, E-4B surveillance methodology. Final report.** Wang. Boeing Military Airplane Co., Seattle, WA (USA). 29 Sep 1986. 146p. Available from NTIS, PC A07/MF A01.

The development of the E-4B aircraft included adding the protection required to ensure that the aircraft would survive the nucleal-attack environment defined in the system specification. This was accomplished in two major phases. The first, the 1b-2 Phase, included the primary hardening analysis, design, and verification efforts. This phase produced the first, nuclear-hardened E-4B aircraft, Aircraft no. 4 (75-00125). The second major phase, the 1C-1 Phase, converted the three existing E-4A aircraft, Aircrafts No. 1 (73-01676), No. 2 (73-01677), and No. 3 (74-00787) to the E-4B configuration. This included installing the same hardening designs on the these three aircraft. Additional analysis and design required by differences between these aircraft or by modifications to the aircraft subsequent to delivery of aircraft No. 4 were also performed during the 1C-1 phase.

3387 (AD-A–210903/1/XAB) **Battlefield nuclear weapons and tactical gridlock in Europe.** Cannon, M.W. Army Command and General Staff Coll., Fort Leavenworth, KS (USA). School of Advanced Military Studies. 17 Nov 1988. 60p. Available from NTIS, PC A04/MF A01.

This paper addresses the issue of whether the use of tactical nuclear weapons in a war in Europe will bring about a tactical stalemate or gridlock. The TRADOC Common Teaching Scenario is used for a guide as to the area, forces employed, general situation, and nuclear weapons available to commanders on both sides. With these considerations, two iterations of a war game were run and the areas contaminated and rough levels of casualties calculated. An analysis of how this may affect battlefield maneuver is made and other issues which may affect the use of battlefield nuclear weapons are presented. The paper concludes with a discussion of areas that require additional research to further develop the answer to the research question.

3388 (NVO–209-Rev.9) **Announced United States nuclear tests, July 1945–December 1988.** USDOE Nevada Operations Office, Las Vegas, NV (USA). Office of External Affairs. Sep 1989. 64p. Sponsored by U.S. DOE Defense Programs. Order Number DE90001812. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This document lists chronologically and alphabetically by event name all nuclear tests conducted and announced by the United States from July 1945 through December 1988, with the exception of the GMX experiments. The 24 GMX experiments, conducted at the Nevada Test Site (NTS) between December 1954 and February 1956, were "equation-of-state" physics studies that used small chemical explosives and small quantities of plutonium. Several tests conducted during Operation Dominic involved missile launches from Johnston Atoll. Several of these missile launches were aborted, resulting in the destruction of the missile and nuclear device either on the pad or in the air.

3389 (SAND–86-2189C) **Reverse Hopkinson bar testing.** Bell, W.K.; Davie, N.T. Sandia National Labs., Albuquerque, NM (USA). [1987]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-870566–3: Institute of Environmental Sciences annual meeting, San Jose, CA (USA), 4-8 May 1987). Order Number DE90002971. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A new test technique, Reverse Hopkinson Bar Testing, has been developed for mechanical shock simulation. A long cylindrical aluminium bar is used as a projectile to strike a test item. The strain wave in the bar is measured and from this, this input force to the test item can be calculated. This method generates a trapezoid shaped force-time history at the bar, test item interface. The test technique is described in detail, and it will be shown how the peak force pulse duration can be independently controlled. Reverse Hopkinson Bar testing of a Nuclear Depth Bomb will be described where the technique is used to simulate the water impact force the weapon experiences upon striking the ocean surface. Results of the simulation are compared with field test data. 4 refs., 9 figs.

3390 (UCRL–100794) **Environmental corrections for a neutron-induced gamma-ray spectroscopy logging system in an air-filled borehole.** Hearst, J.R.; Conaway, J.G.; Mathews, M.A.; Barber, J.W. Lawrence Livermore National Lab., CA (USA). Oct 1989. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-891057–3: 3. international symposium on borehole geophysics, Las Vegas, NV (USA), 2-5 Oct 1989). Order Number DE90002784. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

When a nuclear explosive is tested underground, rock in the immediate vicinity of the explosion is heated to very high temperatures. If any of that rock contains carbonates (dolomite or calcite), these are dissociated and the carbon may combine with oxygen to form carbon dioxide, increasing the hazard of a delayed leak. We are trying to adapt a commercial neutron-induced gamma-ray spectroscopy log to estimate carbonate content in emplacement (2- to 4-m diameter) boreholes at the Nevada Test Site. Such a log would test a much larger (and therefore presumably more representative) sample than the few grams currently used in sample analysis and would be continuous rather than discrete. 14 refs., 15 figs., 1 tab.

3391 **Defensive technologies for Europe.** Canavan, G.H. (Los Alamos National Lab. (US)). pp. 218 of Strategic defense and the Western alliance. Lakoff, S.; Willoughby, R. Lexington Books, D.C. Heath and Co., Lexington, MA (1987).

This discussion reviews the strategic defense technologies applicable to the European theater and assesses their expected performance there. It summarizes the more extensive discussions of defensive concepts and countermeasures found in Theater Applications of Strategic Defense Concepts, as well as the more detailed treatment of cost-effectiveness, survivability, and stability in Strategic Defense Concepts for Europe. Where possible, the basis for numerical estimates is given in the text.

3392 (Juel-Spez–493) **Documentation of the first measuring campaign of September 8-12, 1986 within the framework of the research project 'Dispersion of pollutants in complex terrain after short-term emissions'.** Zeuner, G.; Heinemann, K.; Mextorf, O.; Mueller, S. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Abt. Sicherheit und Strahlenschutz. Jan 1989. 115p. (In German). Order Number DE90721901. Available from NTIS (US Sales Only), PC A06/MF A01.

In the first part of this documentation the geographic conditions of the terrain are examined and the metereological measuring systems used are described. The second part deals with the data obtained while only a small part of the results is presented in figures due to the enormous amount of data material gathered. In particular results that show the influence of the hill on the flow conditions are presented. The macroclimate prevailing at the time of measurement favoured the formation of inversions in the night. The comparatively moderate wind forces and the changes in the wind direction at the hill which are connecteed with these inversions are clearly recognizable. In the last part the structure of the data stored on the magnetic tape is explained. The data were combined into standardized data records on data carriers to make further scientific evaluations easier. With the agreement of the Federal Ministry for the Environment the complete data material was made available for interested users. (orig./KW).

3393 (PB–89-218739/XAB) **Global tropospheric chemistry: Chemical fluxes in the global atmosphere.** Lenschow, D.H.; Hicks, B.B. National Center for Atmospheric Research, Boulder, CO (USA). May 1989. 112p. Available from NTIS, PC A06/MF A01.

See also PB–85-125524.

In October 1987, NSF, NASA, and NOAA jointly sponsored a workshop at Columbia University to assess the experimental tools and analysis procedures in use and under development to measure and understand gas and particle fluxes across this critical air-surface boundary. This report presents the results of that workshop. It is published to summarize the present understanding of the various measurement techniques that are available, identify promising new technological developments for improved measurements, and stimulate thinking about this important measurement challenge.

3394 **Ozone and other issues in global atmospheric chemistry.** Wuebbles, D.J.; Kinnison, D.E. 1p. American Institute of Chemical Engineers, New York, NY (1988). (CONF-881143–: American Institute of Chemical Engineers annual meeting, Washington, DC (USA), 27 Nov - 2 dec 1988).

Technical Paper 127E.

Atmospheric chemistry will likely play an important role in determining the future state of climate, and the rate of climate change. Many of the same gases of direct importance to climate changes as greenhouse gases, such as CO_2, CH_4 and several CFCs, also can have indirect effects on climate through their chemical interactions with other important atmospheric constituents. For example, within the troposphere, emissions of CH_4, CO, and NO_x may affect concentrations of ozone, itself a radiatively important gas, and hydroxyl, OH, which, while not radiatively important, has an important impact on atmospheric chemistry as a scavenger of other gases. In the stratosphere, dissociation of the CFCs, CH_4, and N_2O, can lead to significant changes in the ozone distribution. The two-dimensional chemical-radiative-transport model of the troposphere and stratosphere developed at Lawrence Livermore National Laboratory (LLNL) provides a useful tool to study the past effects and potential future changes that such emissions may have on the atmosphere. Using this model the authors describe some of the key current issues in global atmospheric chemistry that relate to climatic change.

3395 **Climate change and its effect on wet-removal processes.** Hales, J.M. 1p. American Institute of Chemical Engineers, New York, NY (1988). (CONF-881143–: American Institute of Chemical Engineers annual meeting, Washington, DC (USA), 27 Nov - 2 dec 1988).

Technical Paper 127C.

Because of the potential for simultaneous change of multiple meterological variables, it is difficult to predict with certainty the impact of future climate change on the wet removal of atmospheric pollutants. In view of this situation it is often expedient to perform modeling sensitivity analyses, wherein individual key variables are

allowed to vary while all others are held constant. This paper presents the results of one such analysis, wherein a warm-frontal storm model has been executed to compute scavenging of nitrogen and sulfur compounds. The temperature boundary conditions are varied from one simulation to the next, while those for other meterological and chemical fields (absolute humidity, winds, pollutants) are held fixed. Comparison of predicted wet-deposition rates from these simulations provides considerable insight on the potential impact of climatic temperature changes on the wet cleansing of the atmosphere.

3396 **A county-level approach to regional resource analysis based on climate simulation.** Schuhardt, S.L. (Biology Department, Northern Arizona University, Flagstaff, Arizona (US)); Cushman, R.M.; Boden, T.A. *Journal of Climate (USA),* 2(2): 113-120 (Feb 1989). DOE Contract AC05-84OR21400.

This paper describes the use of a county-level approximation of the grid cells of a general circulation model as an approach to using environmental and resource data in analyzing the effects of climate change. As a demonstration, the effects are estimated of a possible climate change due to a doubling of atmospheric CO_2 on the production of soybeans using two simple approaches based on grid cell averages of county-level yield data. With the first approach, we assume that the future yields will be determined by current climate-yield relationships. The actual 1978 climate (approximate growing-degree days and precipitation in the growing season) corresponding to 1978 yield levels is calculated. The climate characteristics of grid cells with major (grid cell-averaged yield of 56.9–299.3 kg/ha) and minor (1.6–11.6 kg/ha) soybean yield are estimated. Potential future major and minor yields are then estimated from a simulated changed climate. With the second approach, future yields are estimated using a multiple regression equation that relates yield to simulated June and August temperature and July, August, and September–June precipitation. These two simple analyses, which ignore many important factors such as soil fertility, technological advances, development of new soybean varieties, and the validity of the climate simulations, show that soybean yields might decline in the areas where the crop is now grown, but that soybeam agriculture could expand northwards and eastwards if other factors permit. These analyses confirm that it is possible to perform analyses of the effects of climate change using county-level data, although such analyses would have to consider additional factors before the results themselves would be credible.

3397 **The effect of urban warming on the Northern Hemisphere temperature average.** Jones, P.D. (Climatic Research Unit, School of Environmental Sciences, University of East Anglia, Norwich, United Kingdom (GB)); Kelly, P.M.; Goodess, C.M.; Karl, T. *Journal of Climate (USA),* 2(3): 285-290 (Mar 1989).

The significance of the urban warming effect on large-scale and hemispheric mean temperature series is assessed using estimates of the urbanization bias for stations in the United States produced by Karl *et al.* It is concluded that the Northern Hemisphere landmass average recently compiled by Jones *et al.* may contain a spurious warming trend which is, at the maximum, 0.1 °C over the first eight decades of the twentieth century. This is considerably less than the long-term warming trend observed over the same period.

3398 **Specifying monthly mean surface temperatures in Canada and Alaska from the 500 mb height field.** Klein, W.H. (Department of Meteorolgoy, Cooperative Institute for Climate Studies, University of Maryland, College Park, Maryland (US)); Shabbar, A.; Yang, R. *Journal of Climate (USA),* 2(6): 631-638 (Jun 1989).

Specification equations for monthly mean air temperature anomalies at 68 surface stations in Canada and Alaska are derived by applying a forward selection screening procedure to simultaneous monthly mean 500 mb height anomalies at 110 grid points in the Northern Hemisphere and the previous month's local temperature anomaly. For the annual average, these equations explain about 72% of the temperature variance (on dependent data) by means of only 4.3 variables, but with marked regional and seasonal differences.

3399 **Comparison of GCM and energy balance model simulations of seasonal temperature changes over the past 18 000 years.** Hyde, W.T. (Climate System Research Program, Department of Meteorology, Texas A&M University, College Station, Texas (US)); Crowley, T.J.; Kim, K.; North, G.R. *Journal of Climate (USA),* 2(8): 864-887 (Aug 1989).

The sensitivity of a linear two dimensional Energy Balance Model (EBM) to altered surface albedo and insolation over the last 18 000 years is compared to simulations made with the NCAR Community Climate Model (CCM). The two-dimensional EBM is a more general form of that described in North *et al.* and allows for regionally varying albedos of ice sheets and sea ice. It is shown that the EBM's hemispherically averaged land and sea seasonal temperature departures agree excellently with the CCM's in the Northern Hemisphere. In the Southern Hemisphere the seasonal comparisons are less favorable, although the annual-averaged oceanic temperature departures at glacial maximum agree to within 0.3 °C. Since the CCM used prescribed SSTs (from CLIMAP), whereas the EBMs are calculated, our results suggest that the hemispherically averaged glacial-interglacial SST change estimated by CLIMAP is consistent with the altered energy balance requirements of the earth-atmosphere system. Results also suggest that on the largest scales the seasonal temperature field at the earth's surface may be linearly dependent on changes in orbital forcing and surface albedo. We conclude that the EBM performs well enough to justify its use as an exploratory tool for investigating the effects of altered boundary conditions on the earth's annual temperature cycle.

3400 **Modeling bulk atmospheric drainage flow in a valley.** Dobosy, R.J. (Atmospheric Turbulence and Diffusion Division, NOAA/ARL, Oak Ridge, Tennessee (US)). *Journal of Applied Meteorology (USA),* 28(9): 936-947 (Sep 1989).

Most simulations of bulk valley-drainage flows depend heavily on parameterizations. The 1984 Atmospheric Studies in Complex Terrain (ASCOT) field experiment in Brush Creek Valley, Colorado, provided an unprecedented density of measurements in a natural valley of simple shape, allowing tests of assumptions and parameterizations developed from laboratory measurements and detailed numerical simulations. This paper uses the ASCOT data to test a model that computes total fluxes of mass (volume) and momentum—determining buoyant and pressure-gradient forces from measured temperature profiles, and parameterizing drag, entrainment, and sidewall and tributary drainage. Computed divergences of volume and momentum flux are within a factor of 2 of the Doppler lidar measurements in Brush Creek Valley. The relative importance of individual terms as parameterized in the model is discussed. A major problem for future work is the treatment of the interaction between valley drainage and ambient flow.

3401 (AD-A–211029/4/XAB) **Are ozone exceedance rates decreasing? Comment on extreme value analysis of environmental time-series: An application to trend detection in ground-level ozone. Technical report, 1 January-31 July 1989.** Raftery, A.E. Washington Univ., Seattle, WA (USA). Dept. of Statistics. Jul 1989. 14p. (TR–165). Available from NTIS, PC A03/MF A01.

R.L. Smith (1989) in his Statistical Science discussion paper, proposed new methods for analyzing extreme values based on the point process view of high-level exceedances, and illustrated them with a detailed analysis of ozone data from Houston, Texas. The methods are powerful and, in particular, the point process of cluster peaks over a high threshold provides a remarkable condensation of the massive data set that he analyzes. It involves little loss of relevant information and permits fairly simple analyses. Smith's conclusion is that there is no trend in the overall levels of the series, but that there is a marked downward trend in the extreme values. It seems hard to find physical explanations for this, and here the evidence is reassessed in terms of a comparison between competing models for the intensity of a Poisson process. This suggests that there is some evidence for a decreasing trend in exceedance rates but that it is rather weak. If there is a trend, it seems more likely to

consist of a fairly abrupt change than a gradual decrease. The possibility that such a change is due to an improvement in measurement technology is discussed. The possibility of long-memory dependence is also considered and the clustering, method used is discussed.

3402 (AD-A–211201/9/XAB) **Electrostatic precipitation of charged particles from a turbulent flow between coaxial cylinders.** Shapiro, M.; Oron, A.; Gutfinger, C. Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Chemical Engineering. Feb 1989. 17p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Colloid and Interface Science, Vol. 127, No. 2, 401-416(Feb 1989).

Transport and deposition of charged particles from a turbulent flow within a cylindrical precipitator are analyzed theoretically. Particle collection efficiency is calculated for different diffusivity models. The effect of particle inertial properties upon the collection rate is studied. It is shown that the Deutsch formula for particle efficiency is valid for moderate values of the applied electrostatic field. The performances of parallel plate and cylindrical precipitators are compared on the basis of the calculated collection efficiencies. The effect of the dielectrophoretic capture mechanism upon the particle-collection rate is evaluated.

3403 (AD-A–211242/3/XAB) **Compliance testing of the Eglin AFB (Air Force Base) asphalt-concrete Batch Plant, Eglin AFB, Florida. Final report, 5-11 March 1989.** Garrison, J.A. Air Force Occupational and Environmental Health Lab., Brooks AFB, TX (USA). Jun 1989. 85p. (AFOEHL–89-051EQ0058FEF). Available from NTIS, PC A05/MF A01.

At the request of HQ AFSC/SGPB, stationary source compliance testing for particulate emissions was conducted on the Eglin AFB Asphalt-Concrete Batch Plant, Bldg 572. Testing was requested to determine particulate emissions compliance status with regards to State of Florida Administrative Code, Rules 17-2 (Air Pollution) and 17-4 (Permits) and State of Florida Environmental Regulation Permit No. A046-122393. Testing involved using two types of aggregate, a red clay type material with high percentage of fines and a coarser white sand. Results indicate that emission rates for each type of aggregate were well below state emission limits imposed by Rule 17-2 and Permit no. A046-122393.

3404 (ANL/PPRNT–89-183) **A collaborative effort to model plant response to acidic rain.** Jacobson, J.; Irving, P.; Kuja, A.; Lee, J.; Shriner, D.; Troiano, J.; Perrigan, S.; Cullinan, V. Argonne National Lab., IL (USA). [1989]. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90003002. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Radish plants were exposed three times per week to simulated acidic rain at pH values of 2.6 to 5.4 over the course of four weeks in trials performed at Argonne, Illinois; Ithaca and Upton, New York; Corvallis, Oregon; Oak Ridge, Tennessee; and Toronto, Canada. Uniform genotype, soil media and planting techniques, treatment procedures, biological measurements, and experimental design were employed. Growth of plants differed among trials as a result of variation in greenhouse environmental conditions according to location and facilities. Larger plants underwent greater absolute but lower relative reductions in biomass after exposure to the higher levels of acidity. A generalized Mitscherlich function was used to model the effects of acidity of simulated rain on dry mass of hypocotyls using data from three laboratories that performed duplicate trials. The remaining data, from three other laboratories that performed only one trial each, were used to test the model. 14 refs., 2 figs., 7 tabs.

3405 (BNL–43127-Rev.) **FACE: A free-air facility for fumigation with gaseous air pollutants: Revision.** Lipfert, F.W.; Lewin, K.F.; Hendrey, G.R.; Daum, M.L. Brookhaven National Lab., Upton, NY (USA). Feb 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8906215–1-Rev.: 20. international ICT conference: environmental testing in the 90's, Karlsruhe (Germany, F.R.), Jun 1989). Order Number DE90002292. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A computer-controlled open air test facility is described which is capable of maintaining pollutant gas concentrations at preset levels while allowing natural fluctuations in solar radiation, precipitation, wind conditions, temperature, and relative humidity. The system has been used successfully in various configurations with SO_2, CO_2, and ozone. CO_2 fumigation has been used to evaluate the response of field-grown cotton, using a 22-m diameter fumigation ring. The system is modular and portable and has been tested at Brookhaven National Laboratory (BNL) and in Mississippi; a field of study is planned for 1989 in Arizona. 8 refs., 9 figs.

3406 (BNL–43361) **Vertical distribution of pollutants in the presence of convective storms.** Kleinman, L. Brookhaven National Lab., Upton, NY (USA). [1989]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8906154–2: 28. Liege international astrophysical colloquium on our changing atmosphere, Liege (Belgium), 26-30 Jun 1989). Order Number DE90002590. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

During the PRECP V field program vertical profiles of CO, NO_y, SO_2, O_3, H_2O_2, aerosol particles and water vapor were measured in the vicinity of convective storms or in air masses which had experienced convection in their recent past. Peak concentrations occur at the altitudes at which the various substances are emitted or formed in the atmosphere. For water vapor, SO_2, CO, NO_y and submicron aerosol particles this is the boundary layer. High concentrations of O_3 occur in the boundary layer where it is photochemically formed and in the upper troposphere as a result of downward transport from the stratosphere. The peak formation rate and the highest concentration of H_2O_2 occurs above the boundary layer. The insoluble pollutants CO and NO_y can be efficiently transported from the boundary layer to upper troposphere. Soluble species such as SO_2 and aerosol particles cannot be similarly transported from the boundary layer to upper troposphere. The observed proportionality between aerosol particles and water vapor is consistent with limits on the upward transport imposed by the sequence of cooling, cloud formation, and removal in precipitation. 6 refs., 3 figs.

3407 (CONF-890814–9) **Environmental quality and the shift to alternative fuels: Progress and interim findings of a Department of Energy study of transition in vehicular power systems.** Saricks, C.L.; Rajan, J.B.; Singh, M.K. Argonne National Lab., IL (USA). 22 Aug 1989. 32p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract W-31109-ENG-38. From American Institute of Chemical Engineer's summer national meeting; Philadelphia, PA (USA); 20-23 Aug 1989. Order Number DE90002178. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The goal of the last component, environmental consideration, is to identify potential environmental, health, and safety constraints and effects that could jeopardize a smooth transition or might render some aspects of transition inadvisable. These effects are not necessarily "better" or "worse," just different. Specific tasks include (a) developing a quantitative estimate of the relative air emissions due to domestic fuel production and vehicular operation of each fuel penetration "scenario" identified by the fuel distribution and vehicle supply component, (b) estimating air quality and waste disposal effects of these scenarios, and (c) defining public and occupational safety and health issues related to domestic fuel and power system production, fuel handling, and vehicular operation. No attempt to quantify or assign a value to net environmental benefits is undertaken as part of the DOE analysis. This report focuses on this third study component, discussing the environmental, health and safety (EH & S) transition issues that have been identified as of July 1, 1989 and describing methodologies to be applied in forthcoming quantitative analyses. As appropriate, findings to date from other components of the study will be cited. The following section, which presents EH & S concerns for each of the three prime candidate alternative fuels, is drawn largely from a forthcoming study progress report.

3408 (CONF-8906244–1) **US Energy use: New technologies and policies in response to global warming.** Streets, D.G.; Bloyd, C.N.; Kenski, D.M. Argonne National Lab., IL (USA). Jun 1989. 39p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Conference on responding to the threat of global warming: options for the Pacific and Asia; Honolulu, HI (USA); 21-27 Jun 1989. Order Number DE90002170. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Energy use and production accounts for by far the largest portion of emissions of greenhouse gases in the United States and the world. The US Environmental Protection Agency (EPA) has estimated that, worldwide, these activities were responsible for 57% of greenhouse warming in the 1980s. Other activities and their respective contributions as shown in Fig. 1 include agriculture, 14%; land use and modification, 9%; chlorofluorocarbon (CFC) use, 17%; and other (nonenergy) industry, 3%. Given this importance of energy activities, it is appropriate that efforts to forestall global warming have focused on these activities. Because the United States consumes the largest share of world energy and thus produces the largest share of greenhouse gas emissions, it is the target of many such efforts. A number of US government responses to global warming have been proposed or are now under way. For example, the 101st Congress has seen 11 bills dealing with global warming issues; a research program on climate change has been promised $190 million for 1990; and the United States has signed the Montreal Protocol to control CFCs. The paper that follows discusses US energy and related emissions of greenhouse gases. Energy use in each sector is briefly characterized and several new technologies for energy use in that sector are described. Finally, national and state policies that offer potential to reduce energy use are discussed. This discussion is limited by space considerations to only a sampling of the many technologies under development and policy options that have been proposed. 20 refs., 12 figs., 6 tabs.

3409 (DOE/ER–0425) **Carbon dioxide and climate: Summaries of research in FY 1989.** USDOE Office of Energy Research, Washington, DC (USA). Office of Health and Environmental Research. Oct 1989. 87p. Sponsored by U.S. DOE Energy Research. Order Number DE90001791. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Scientific and public interest in greenhouse gases, climate warming, and global change has virtually exploded in 1989. The Department's focused research on Co_2 contributed sound and timely scientific information to the myriad of questions produced by the groundswell of interest and concern. Research projects summarized in this document provided the data base that made timely responses possible, and the contributions from participating scientists are genuinely appreciated. The nation's interest has been well served. In the past year, the core CO_2 research has continued to improve the scientific knowledge needed to project future atmospheric CO_2 concentrations, to estimate climate sensitivity, and to assess the responses of vegetation to rising concentrations of CO_2 and climate change. The Carbon Dioxide Research Program's goal is to develop sound scientific information for policy formation and governmental action in response to changes of atmospheric CO_2. During this year, the Program was moved into the Office of Health and Environmental Research and was combined with other atmospheric research activities. The work is now administered by the Atmosphere and Climate Research Division (ACRD). In addition to supporting core CO_2 research and developing a program around the new initiatives, ACRD is responsible for atmospheric science and climate. Its scope includes atmospheric chemistry, numerical modeling, laboratory studies, and field experiments. This Program Summary describes projects funded by the Carbon Dioxide Research Program during FY 1989 and gives a brief overview of the objectives, organization, and accomplishments of that research.

3410 (DOE/ER/60294–T1) **Participation in the MAP3S precipitation chemistry network: Progress report, August 1, 1988–July 31, 1989.** Pennsylvania State Univ., University Park, PA (USA). [1989]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER60294. Order Number DE90002755. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Progress is reported on precipitation chemistry at the Penn State Atmospheric Research Site. Hydronium ion, sulfate, and nitrate variations are discussed. Work on cloud chemistry and air chemistry is also briefly discuss. 6 refs., 13 figs. (CBS)

3411 (DOE/ER/60313–4) **Sources of methane in China: A program to estimate the emissions from rice paddies, biogas pits and urban areas: Annual progress report.** Rasmussen, R.A.; Khalil, M.A.K. Oregon Graduate Center, Beaverton, OR (USA). Inst. of Atmospheric Sciences. Oct 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-85ER60313. Order Number DE90003351. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The main objectives of our program are (1) to determine the flux of methane from rice fields in China and estimate the global emissions of methane from rice fields, (2) to determine whether the estimated 7-10 million biogas generators in China are contributing to the global increase of methane, and (3) to conduct exploratory studies of emissions of other environmentally significant trace gases from rice fields and biogas generators. The last two objectives have been fulfilled. 3 refs.

3412 (DOE/ER/60549–3) **Lung cancer risk from inhalation of radon and other pollutants in rats: Comprehensive progress report, March 1, 1987–February 28, 1990.** Burns, F.J. New York Univ., NY (USA). Dept. of Environmental Medicine. [1989]. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER60549. (COO–60549-3). Order Number DE90002553. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The goal of these experiments is to establish a quantitative correlation between early DNA damage and cancer incidence that would be helpful for assessing the carcinogenic risk of radon inhaled alone or in combination with specific indoor pollutants. Rat tracheal epithelium will be exposed in vivo to ^{210}Po alpha particles from specially fabricated needles inserted intratracheally. To assess the effect of indoor pollutants the rats will be exposed by inhalation to NO_2 or cigarette smoke. DNA strand breaks, DNA synthesis suppression and basal cell proliferation in the respiratory epithelium will be determined and compared with the cancer incidence and the degree of histopathological damage. Several implant designs by 2 separate suppliers have been considered and tested. Design considerations included the shape of the implant, safety of handling the implant, stability of the implant in contact with body fluid, and stabilization of the implant in the center of the tracheal lumen. Many ideas were tried and rejected before we selected the current design. The implant is a 7.0 mm long hollow needle with an outside diameter of 1.0 mm fabricated of silver alloy. Threaded through the needle lengthwise are three strands of welded dental wire. The dental wire protrudes through both ends and flares outward to stabilize the needle in the center of the airway. The needle is electroplated with various amounts of ^{210}Po to provide tracheal dose rates from 2.0 Gy per minute down to about 2.0 Gy per week. 34 refs., 17 figs.

3413 (DOE/ER/60549–4) **Cancer risk for radon exposure in a polluted environment: Progress report, March 1, 1989–February 28, 1990.** Burns, F.J. New York Univ., NY (USA). Dept. of Environmental Medicine. [1989]. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER60549. (COO–60549-4). Order Number DE90002554. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Several implant designs by 2 separate suppliers have been considered and tested. Design considerations included the shape of the implant, safety of handling the implant, stability of the implant in contact with body fluid, and stabilization of the implant in the center of the tracheal lumen. Many ideas were tried and rejected before we selected the current design. The implant is a 7.0 mm long hollow needle with an outside diameter of 1.0 mm fabricated of silver alloy. Threaded through the lumen of the needle lengthwise are three strands of welded dental wire (Figure 1). The dental wire protrudes through both ends and flares outward to stabilize the needle in the center of the airway. The needle is electroplated with the various amounts of ^{210}Po to provide tracheal dose rates from 2.0 Gy per minute down to about 2.0 Gy per week.

3414 (DOE/ER/60655–2) **Regional aerosol deposition in human upper airways: Annual progress report, March 1, 1989–February 28, 1990.** Swift, D.L. Johns Hopkins Univ., Baltimore, MD (USA). 1 Nov 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER60655. Order Number DE90003314. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

During the report period significant progress on the quantitative understanding of regional upper airway deposition of airborne particle has been realized. Replicate models of the human upper airways obtained from post-mortem casting of the nasal, oral, pharyngeal, laryngeal and upper tracheal regions and in vivo magnetic resonance imaging (MRI) of the same regions of adults and children

have been employed to determine the overall and local deposition characteristics of aerosols in the ultrafine (1–100 μm diameter) and fine (0.8–12 μm diameter) region. Studies have been carried out for both nasal and oral breathing during inspiratory and expiratory flow at constant flow rates representative of rest and states of exercise. The results of these investigations indicate that particles in the size range of "unattached" radon progeny (1–3 nm) are deposited in both the nasal and oral passages with high efficiency (60–80%) for both inspiration and expiration, with the nasal deposition being somewhat greater (5–10%) than oral deposition. The effect of flow rate on upper airway deposition for both pathways is not great; data analysis indicates that the deposition for all flow rates from 4–50 liters/minute can be grouped by plotting deposition vs $Q^{-1/3}$, where Q is flow rate, a far weaker dependency than observed for inertial deposition. Diffusional transport is the primary mechanism of deposition, and size dependence can be accounted for by plotting, deposition percent vs D^n where D is particle diffusion coefficient and n ranges from 0.5–0.66. 2 refs.

3415 (DOE-tr–89-4) **Contribution to atmospheric pollution of the activities of CSI Italsider in Bagnoli.** (Contributo dell 'attivita' del CSI Italsider di Bagnoli all'inquinamento atmosferico). Palumbo, A. USDOE, Washington, DC (USA). 1989. 37p. Translation source information not available. Sponsored by U.S. DOE Management & Administration. Order Number DE90002739. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The quality of the air in the area of Bagnoli is the result of emissions coming from: industrial activity in the city of Naples; the large amount of automobile traffic which develops both in the metropolitan area as well as along the roads radiating away from the downtown area; from production plants located in the western section of the city; from the meteorological conditions in the mesoscale; and from the local microclimatic conditions connected with the orography of the site. In order to determine the pollution contribution of CSI Italsider in Bagnoli in the western section of the city of Naples, a model of the ATDL (Atmospheric Turbulence and Diffusion Laboratory, Appendix no. 1) steady state type was designed, adapted to the simulation of atmospheric pollution diffusion in urban areas, which was used successfully in other industrialized cities such as St. Louis. The model was then calibrated by means of a comparison between calculated values and those observed over numerous seasons of monitoring in Naples. The calculation program was run in initial time including the emissions coming from the CSI in Bagnoli among the inputs required by the model so as to obtain an overall map of the pollution of anthropical and natural origin coming from all sources in the Naples metropolitan area. It was then run with only the CSI emissions entered into the program.

3416 (KFK-PEF–51) **5th status colloquium of the PEF, March 7-9, 1989 in the Nuclear Research Center in Karlsruhe. Summarizing reviews of the program management.** Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftre. Apr 1989. 95p. (In German). Available from Available from Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF).

This report compiles the summarizing reviews of the program management in the final session of the 5th status colloquium. The full papers, to which the summaries refer, are published in KfK-PEF 50. (orig.).

3417 (N–89-17364) **Feasibility study of methods for stopping the depletion of ozone over Antarctica. Final report.** Texas Univ., Austin, TX (USA). May 1988. 74p. (NASA-CR–184583;NAS–1.26:184583). Available from NTIS, PC A04/MF A01.

Ways of stopping the ozone depletion in the ozone hole over Antarctica were studied. The basic objectives were: (1) to define and understand the phenomenon of the ozone hole; (2) to determine possible methods of stopping the ozone depletion; (3) to identify unknowns about the hole and possible solutions. Two basic ways of attacking the problem were identified. First is replenishment of ozone as it is being depleted. Second is elimination of ozone destroying agents from the atmosphere. The second method is a more permanent form of the solution. Elimination and replenishment methods are discussed in detail.

3418 (N–89-28118, pp. 197-198) **Tropospheric nitric oxide measurements.** Torres, A.L. National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center. 1988. (NASA-TM–101257;NAS–1.15:101257). In *Laboratory for Oceans.* Available from NTIS, PC A12/MF A01.

Nitric oxide (NO) plays a key role in tropospheric photo-chemistry. The photochemical oxidation of hydrocarbons, for example, can serve as either a source or a sink for ozone, depending on the local abundance of NO. Nitric oxide also helps govern atmospheric concentrations of the hydroxyl (OH) radical. The OH radical is the single most important player in photochemical transformations because it controls the atmospheric lifetimes of so many chemical species. Although NO serves as a very effective catalyst in many important chemical processes, its concentration is low enough to normally be expressed in units of parts per trillion by volume (pptv). Consequently, commercially available detectors for NO (with detection limits of about one part per billion) have proven to be unsuitable for use anywhere except in urban areas and near other local pollution sources. Under the sponsorship of NASA's Global Tropospheric Experiment (GTE), Wallops has developed an extremely sensitive detector with a detection limit of a few pptv. The system was specifically designed for aircraft use, with the objective of applying it in global aircraft studies of tropospheric chemistry. Studies with the detector are examined.

3419 (NEI-DK–211) **Hydrogen chloride bonding on dry limestone.** Energiministeriets Energiforskningsprogram. Miljoe og restprodukter. Dam-Johansen, K.; Ibaek Jensen, P.; Weinell, C.E.; Livbjerg, H.; Oestergaard, K. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Kemiteknik. Jul 1989. 18p. (In Danish). Order Number DE90718974. Available from NTIS (US Sales Only), PC A03/MF A01.

Energiministeriets Energiforskningsprogram. Miljoe og restprodukter.; EFP-88.

Resume of a pilot project concerning the chemical reactions involved during bonding of hydrochloric acid with dry limestone. Local acidification caused by HCl air pollution significantly contributes to damage of plants and materials. The incineration of municipal wastes currently produces the highest percentage of HCl pollution in Denmark. (AB).

3420 (NEI-DK–220) **Calculation of air pollution dispersion over a complex terrain with special emphasis on dimensioning of chimney stacks.** Energiministeriets Energiforskningsprogram. Miljoe og restprodukter. Berkowicz, R.; Olesen H.R.; H.R.; Gryning, S.E.; Larsen, S.E. Miljoestyrelsen, Roskilde (Denmark). Luftforureningslab.; Risoe National Lab., Roskilde (Denmark). Dec 1988. 207p. (In Danish). Order Number DE90719157. Available from NTIS (US Sales Only), PC A10/MF A01.

Energiministeriets Energiforskningsprogram. Miljoe og restprodukter.; EFP-84.

The project: "Dispersion of air pollution in complex terrain, with emphasis on coastal regions" was conducted during the years 1985-1987. The subjects investigated, and summarized in this report, were dispersion climatology in coastal regions, wind and temperature structure in coastal regions and over water, turbulence structure in coastal regions and the internal boundary layer, the Oeresund Project tracer experiments (an analysis) and the application of the OML-model for modelling dispersion in coastal regions. No new operational dispersion models have resulted from the project. Due to the complexity of the problem, it is unlikely that coastal dispersion can be simulated by a single code. An evaluation of the OML-model (an operational dispersion code) has shown that under certain conditions such a code can be applied to sources near a coast. The code can be used for estimation air pollution from sources inside the internal boundary layer. This condition will usually be satisfied when the distance to the nearest water body is a least a few kilometers. In a case of a more complicated terrain configuration, a model developed for homogeneous condition will not perform well. This is the situation for transport of pollution across the Oeresund. Analysis of data from this experiment has shown that there will be a uncertainty in model prediction even with use of a more sophisticated model. The growth of the internal boundary

layer was investigated and some simple models was suggested for future studies. A necessary condition for prediction of the growth of the internal boundary layer is the knowledge of the vertical thermal structure along the coastline. Measurements of the coastal temperature profiles are needed to clarify when and what models can be used in this area. (AB) 14 refs.

3421 (NILU/OR–78/88) **NO_X emissions from stationary sources in eastern Europe.** Pacyna, J.M. Norsk Inst. for Luftforskning, Lillestroem (Norway). Nov 1988. 36p. Order Number DE90719389. Available from NTIS (US Sales Only), PC A03/MF A01.

Emission estimates of NO_X from major stationary sources in Eastern Europe are presented together with the NO_X emission factors and the statistics of the production of industrial goods and the consumption of raw materials. The national totals are presented as well as estimate of NO_X emissions from individual sources. Finally, the spatial distribution of the NO_X emissions from stationary sources is given within the EMEP grid of 150 km x 150 km. 13 refs., 1 fig., 10 tabs.

3422 (ORNL/FTR–3424) **[Deposition of atmospheric nitrogen species to forests in North America and Europe]: Foreign trip report, September 24–October 11, 1989.** Lindberg, S.E. Oak Ridge National Lab., TN (USA). 22 Oct 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002067. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler was invited to (1) present an invited seminar at the Juelich Nuclear Center, (2) visit the Landesanstalt fuer Immissionschutz for the State of Nordhein-Westfalen, (3) visit the Institute for Bioclimatology at the University of Goettingen, (4) present an invited plenary lecture at the International Congress on Forest Decline, and (5) visit field sites operated by the University of Freiburg. At Juelich, the traveler presented a joint seminar to the Institutes of Atmospheric Chemistry and Radioagronomy on "Deposition of Atmospheric Nitrogen Species to Forests in North America and Europe." At LIS, he visited the Egge Mountains field sites for discussions of deposition measurements. At the University of Goettingen, where the traveler was on sabbatical assignment during 1987, the progress of joint research was discussed and manuscripts finalized. At the Congress on Forest Decline, he delivered an invited plenary lecture on "Rates of Wet, Dry, and Cloud Deposition to American Forests" and went on an excursion to the Hoeglwald Forest and Frauenhofer Institute research sites. At the University of Freiburg, he visited field sites in the Black Forest where deposition/nutrient cycling research is performed.

3423 (ORNL/FTR–3429) **[Growth and physiology of red spruce in relationship to acidic deposition in the Great Smoky Mountains National Park, USA]: Foreign trip report, September 30, 1989–October 14, 1989.** McLaughlin, S.B. Jr. Oak Ridge National Lab., TN (USA). 25 Oct 1989. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002512. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended the first day and a half of the International Conference on Forest Decline Research at Friedrichschafen, Federal Republic of Germany, where he presented a poster, "Growth and Physiology of Red Spruce in Relationship to Acidic Deposition in the Great Smoky Mountains National Park, USA," by S.B. McLaughlin, C.P. Andersen, N.T. Edwards, P.J. Hanson, M.J. Tjoelker, and W.K. Roy. This stopover was a preface to the principal trip to Russia as part of a joint US-USSR Environmental Protection Agreement designed to increase exchange between scientists involved in pollution-related research. The traveler was a guest of Dr. Sergei Semenov of the USSR State Committee for Hydrometeorology and Control of Natural Environment, USSR Academy of Sciences. With a colleague, Dr. Al Heagle of the Agricultural Research Service of the US Department of Agriculture (USDA), he visited four Soviet research installations, and a Biosphere Reserve field research site while traveling from Pushchino, 100 km south of Moscow, to Moscow, and on to Leningrad over a ten-day period.

3424 (ORNL/FTR–3434) **[The cause of the glacial to interglacial atmospheric CO_2 change]: Foreign trip report, October 14, 1989–October 24, 1989.** Peng, Tsung-Hung. Oak Ridge National Lab., TN (USA). 24 Oct 1989. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002829. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended the Third International CO_2 Conference at Hinterzarten, Federal Republic of Germany, and presented two papers, one entitled "The Cause of the Glacial to Interglacial Atmospheric CO_2 Change: A Polar Alkalinity Hypothesis," and the other entitled "Global Net CO_2 Flux Across the Sea-Air Interface Based on the Observed pCO_2 in Surface Water." Nine sessions on various special topics were held. These sessions, all of great interest to the Global Carbon Cycle Research Program at Oak Ridge National Laboratory, included (1) ice core CO_2 measurement, (2) causes of glacial-interglacial CO_2 variations, (3) atmospheric CO_2 observation, (4) isotopes in the carbon cycle, (5) exchange of carbon between atmosphere and land biota, (6) land biota and the carbon cycle, (7) marine biota and the carbon cycle, (8) oceanic pCO_2, and air-sea exchange, and (9) ocean modeling and oceanic processes. Sixty papers were presented orally, and 22 others were presented in poster sessions.

3425 (ORNL/FTR–3449) **[The role of oceans in determining atmospheric CO_2]: Foreign trip report, October 14, 1989–October 22, 1989.** Sarmiento, J.L. Oak Ridge National Lab., TN (USA). 27 Oct 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002653. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

J.L. Sarmiento presented two papers at the Third International Conference on Analysis of Atmospheric CO_2 Data Present and Past. The first paper, "On the Role of the Oceans in Determining Atmospheric CO_2," concerned primarily the work that is being carried out in collaboration with M.J.R. Fasham on the development of ecosystem models for predicting the possible role of changes in the biological cycling of carbon in affecting atmospheric CO_2 levels. The second paper, 3-D Ocean Models of Anthropogenic CO_2 Uptake," concerned the work being carried out in collaboration with U. Siegenthaler on simulating the uptake of anthropogenic CO_2 by the oceans in the absence of any changes in the biology. Sarmiento also met with Siegenthaler to plan a future series of oceanic anthropogenic CO_2 uptake experiments and listened to a series of presentations on recent work in this area, of which the atmospheric measurements and models were of considerable value. The International Geosphere-Biosphere Program Panel 5 meeting was held in order to work on the draft of a plan for modeling as part of this program.

3426 (ORNL/FTR–3452) **[Discussions of global environmental problems]: Foreign trip report, October 14, 1989–October 21, 1989.** Krahl-Urban, B. Oak Ridge National Lab., TN (USA). 2 Nov 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002747. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler visited the Oak Ridge National Laboratory (ORNL) at the request of the Environmental Sciences Division to provide programmatic interpretations and technical overviews of research topics addressing international environmental issues. Many of today's environmental problems can no longer be considered as regional-scale impacts. Global warming, acidification, ozone depletion, drought, deforestation, and air pollution effects are global-level processes that can only be effectively approached by international scientific cooperation. The traveler's recommendations for the final planning and coordination of international environmental issues emphasized focusing on international cooperation with research institutions in West Germany and in other countries of the European Community. Several key global environmental issues are addressed by the Juelich Nuclear Research Center (KFA Juelich), West Germany. Scientific cooperation with KFA Juelich should be promising in theoretical ecology, systems analysis, and toxicology. Scientific exchange between ORNL and KFA Juelich in environmental sciences has been initiated by the traveler.

3427 (ORNL/TM–11120) **Red spruce decline—Winter injury and air pollutants.** Roberts, T.M. Oak Ridge National Lab., TN

(USA). Oct 1989. 23p. Sponsored by Electric Power Research Institute. DOE Contract AC05-84OR21400. TVA 1610-1610-A1. Order Number DE90002632. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

There has been a widespread decline in growth of red spruce (Picea rubens Sarg.) since 1960 in the eastern United States. There is evidence that this decline is at least partly attributable to age- and density-related growth patterns, particularly at lower elevations. Mortality has been severe at high elevation sites where similar episodes have occasionally occurred in the last 100 years. At these sites, periods of low growth preceding 1960 were related to periods with warm late summers and cold early winters. Since 1960, this relationship no longer holds, although there is an association with unusual deviations from mean temperatures. There are field reports that one of the main causes of reduced growth and mortality is apical dieback induced by severe winter conditions. Preliminary observations suggest that high elevation red spruce may not be sufficiently hardened to tolerate low autumn temperatures. However, appearance of injury in the spring, association of injury with wind exposure and correlation of provenance susceptibility with cuticular transpiration rates, including the importance of desiccation injury. Sensitivity to both types of winter injury may be increased by air pollutants (particularly ozone and less probably, acid mist or excess nitrogen deposition). Nutrient deficiency (particularly magnesium and to a lesser extent potassium) may also increase cold sensitivity. The nature and extent of these interactions are being actively researched for red spruce. 48 refs.

3428 (PB–89-215669/XAB) **Early detection of health hazards due to asbestos exposure. Final report.** Valic, F. Andrija Stampar School of Public Health, Zagreb (Yugoslavia). Dept. of Occupational Health. 1989. 49p. Available from NTIS, PC A03/MF A01.

See also PB–83-244434.

The prevalence of nonspecific respiratory symptoms in workers exposed to asbestos during asbestos mining and processing were examined. An assessment was made of lung function and radiological changes in these workers. Emphasis was placed on establishing a relationship between the concentration of airborne dust, the length of exposure, and the total exposure with the pulmonary impairment the worker suffered. The study was conducted at two mines, two factories producing asbestos cement products, and one factory manufacturing asbestos textiles and friction materials. Examinations were made of 1,242 asbestos workers and a comparison group of 1,950 workers. Each respiratory symptom analyzed was more common in males than in females and in smokers than in nonsmokers. In 41 of the 897 men, asbestos bodies were recorded. The presence of asbestos bodies was not related to age, duration of exposure, or to the total exposure level. All the symptoms found were much less related to asbestos-fiber years than to total particle years of exposure. Radiological findings indicated that only the prevalences of small opacities increased more or less consistently with the duration of exposure to asbestos, asbestos-fiber years and total-particle years. Some evidence was found of a harmful effect of simultaneous smoking and exposure.

3429 (PB–89-216097/XAB) **Ozone depletion, greenhouse gases, and climate change.** National Academy of Sciences, Washington, DC (USA). Commission on Physical Sciences, Mathematics, and Resources. 1989. 137p. Available from NTIS, PC A07/MF A01.

Library of Congress catalog no. 88-31544.

Ozone depletion in the stratosphere and increases in greenhouse gases in the troposphere are both subjects of growing concern - even alarm - among scientists, policy makers, and the public. At the same time, recent data show that these atmospheric developments are interconnected and in turn profoundly affect climatic conditions. To arrive at a better understanding of this complex relationship, major institutions in the field of atmospheric study convened a symposium of noted researchers. In the volume, they present the results of their most recent research, with the most up-to-date data and theories available on ozone depletion, greenhouse gases, and climatic change.

3430 (PB–89-217814/XAB) **Information on substances for review as toxic air contaminants. Summary report, January 1984-February 1989 (Final).** Jones, M. California State Air Resources Board, Sacramento, CA (USA). Stationary Source Div. Feb 1989. 158p. (ARB/SSD–89-01). Available from NTIS, PC A08/MF A01.

This report summarizes information on the health effects, uses, emissions, ambient concentrations, and atmospheric persistence of substances in two categories. The categories have been established by the California Air Resources Board in consultation with the California Department of Health Services. Both categories are concerned with the review of substances as possible toxic air contaminants. One category consists of substances that have been nominated but not scheduled for review. The second category consists of substances for which more-conclusive health information is needed before the substances can be scheduled for review. Because the report presents information necessary for the selection of substances to enter the journal-review process, the report does not deal with substances already identified as toxic air contaminants or substances now in the review process.

3431 (PB–89-218788/XAB) **Comparison of 0600-0900 AM hydrocarbon compositions obtained from 29 cities.** Lonneman, W.A. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. 1989. 16p. (EPA–600/D-89/010). Available from NTIS, PC A03/MF A01.

This report describes and compares 0600-0900 AM nonmethane organic carbon compound data from 29 cities collected during summer periods of 1984 and 1985. Considerable differences are observed in those areas that are anticipated to have different volatile organic compound emissions. Range of benzene and toluene concentrations are presented for the 29 urban areas. It appears that variation in the observed concentration range is more evident for toluene than benzene. This observation suggests that there may be more discrete sources for toluene than benzene.

3432 (PB–89-220024/XAB) **Effects of acid deposition on painted wood substrates.** Balik, C.M.; Fornes, R.E.; Gilbert, R.D.; Williams, R.S. North Carolina State Univ., Raleigh, NC (USA). Jul 1989. 48p. Available from NTIS, PC A03/MF A01.

This research program identifies early failure processes associated with acidic deposition on painted-wood-substrate systems. Effects observed during short-term accelerated exposure studies are as follows: FTIR, NMR, and Sol-gel analysis indicate that SO_2 attacks the base terpolymer of latex polymeric coating in the presence of UV radiation. The polymer is stable upon exposure to SO_2 alone, either gaseous or aqueous as sulfurous acid. Sulfurous acid diffuses through both oil-alkyd and latex coatings and can degrade lignin of the wood substrate. Field and laboratory studies indicate that $CaCO_3$ and ZnO are removed from latex paints during exposures. The removal rate decreases with increasing pH. Discoloration or yellowing of $CaCO_3$ containing paints on wood substrates was observed after three months field exposure. Based on the findings, it is recommended that research be continued to develop dose-response relationships for the effects of acid deposition on coated-wood-substrate systems.

3433 (PB–89-221030/XAB) **In-depth industrial-hygiene survey report on styrene exposure at Fiberform, Spokane, Washington, January 16-18, 1979.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Industrial Hygiene Section. Nov 1979. 41p. (IWS–078.23). Available from NTIS, PC A03/MF A01.

Portions of this document are not fully legible.

An industrial-hygiene survey was conducted at Fiberfoam in Spokane, Washington on January 16 to 18, 1979 to document worker exposure to styrene. The facility manufactured fiberglass reinforced plastic boats and employed 388 production workers. The manufacturing potential and past exposures, controls, and medical, industrial hygiene, and safety programs were reviewed. Tube sampling for styrene and acetone indicated concentrations ranging from 18.2 to 179 parts per million (ppm) and 9.77 to 235 ppm, respectively. Styrene exposures were highest for workers in the laminating areas. In many instances, styrene concentrations exceeded the OSHA standard of 100 ppm. The ventilation system in the laminating areas needed maintenance and could be replaced with portable circular fans. Protective work practices could be improved. Review of the ventilation maintenance program, institution of an instructional program of the use and maintenance of protective equipment, and

reorganization of the laminating and chopping operations are recommended.

3434 (PB–89-221055/XAB) **In-depth industrial-hygiene survey report on styrene exposure at Larson Industries, Incorporated Boat Plant, Little Falls, Minnesota, February 27-March 1, 1979.** Crandall, M.S. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Industrial Hygiene Section. Sep 1989. 39p. (IWS–078.28). Available from NTIS, PC A03/MF A01.

Worker exposure to styrene was surveyed at Larson Industries Incorporated, Minnesota from February through March 1979. The company manufactures fiberglass reinforced plastic boats. There are 150 workers at the facility, 100 of these are in the production area, and 35% of the production workers are women. Workplace conditions, job types, production processes, past exposures, and medical and industrial surveillance programs were reviewed. A total of 67 charcoal-tube samples were collected and analyzed for styrene and acetone. Concentrations averaged 82.4 parts per million (ppm) and 64.4 ppm, respectively. Many of the styrene samples exceeded the OSHA standard of 100 ppm. The ventilation system failed to control styrene concentrations during winter months. Proper work practices were followed, but exposures were related to the type of job being performed. Charcoal-tube sampling was an effective and reliable technique. It is recommended that the general lamination areas be targeted for new engineering design to reduce styrene exposures and that a program that includes proper fitting and maintenance procedures for respirators be instituted.

3435 (PB–89-221113/XAB) **Maintain and operate California Air Resources Board field fumigation facility for experimental use. Final report, 17 December 1987-30 June 1989.** Olszyk, D.M. California Univ., Riverside, CA (USA). Statewide Air Pollution Research Center. Jun 1989. 29p. Available from NTIS, PC A03/MF A01.

The Statewide Air Pollution Research Center (SAPRC) has had a continuing mission to investigate the effects of air pollutants on both agricultural crops and native vegetation. To further this mission, SAPRC personnel have maintained the California Air Resources Board (ARB) field-exposure facilities at the Experiment Station at the University of California, Riverside for over seven years. The chamber facilities have been used for a wide variety of experiments. Over the past year, a total of five studies were completely or partially carried out in these facilities. ARB-funded studies included: a determination of the effects of ambient ozone on Valencia oranges, and an evaluation of hydrocarbon emissions from vegetation. Studies funded from other sources included an investigation on the effects of ozone and sulfur dioxide on quaking aspen and perennial ryegrass, investigation of the effects of ozone and sulfur dioxide on alfalfa, and a pilot investigation of the long-term injury effects of ozone on conifer seedlings.

3436 (PB–89-221220/XAB) **New chemical alternatives to chlorofluorocarbons and halons. Report for August 1988-February 1989.** Bare, J.C.; Smith, N.D.; Adcock, J.L. Tennessee Univ., Knoxville, TN (USA). Dept. of Chemistry. Feb 1989. 10p. Available from NTIS, PC A02/MF A01.

This paper describes a determination of the basic properties of laboratory quantities of potential alternative compounds which may be used to replace chlorofluorocarbons (CFCs) and halons listed in the Montreal Protocol for Substances that Deplete the Ozone Layer. The property testing currently posed for investigation was designed to assist in the determination of applicability for replacements for CFCs and halons as refrigerants, fire extinguishants, solvents, or foam-blowing agents. The compounds chosen are currently being synthesized by aerosol fluorination, a process which is described in the paper. The actual chemical equations and experimental yields are included.

3437 (PB–89-221246/XAB) **Asbestos-fiber reentrainment during vacuuming and wet cleaning of carpet at a captive research site.** Kominsky, J.R.; Freybery, R.W.; Cain, W.C.; Wilmoth, R.C.; Powers, T.J. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. 31 Mar 1989. 22p. (EPA–600/D-89/055). Available from NTIS, PC A03/MF A01.

A study was conducted to compare the effectiveness of alternative carpet-cleaning techniques and to evaluate the potential for asbestos-fiber reentrainment during cleaning of carpet contaminated with asbestos. The equipment was evaluated at two carpet contamination levels. Airborne asbestos concentrations were determined before and during carpet cleaning. Overall, airborne asbestos concentrations were two to four times greater during the carpet-cleaning activity. The level of asbestos contamination and the type of cleaning method had no statistically significant effect on the relative increase of airborne asbestos concentrations during carpet cleaning.

3438 (PB–89-221253/XAB) **Statistical evaluation of airborne asbestos measured before, during, and after abatement.** Kominsky, J.R.; Freyberg, R.W.; Powers, T.J.; Wilmoth, R.C. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. 31 Mar 1989. 15p. (EPA–600/D-89/054). Available from NTIS, PC A03/MF A01.

A statistical evaluation was made of airborne asbestos concentrations measured before, during, and after removal of asbestos-containing fireproofing at three university buildings. Of the three sites studied, all passed the AHERA z-test when the work-area asbestos levels were compared to perimeter levels (outside the abatement area but inside the building). Two sites also passed the z-test when work area and outdoor air levels were compared. At one site, contamination of the perimeter area occurred at some point during the abatement project. Had this area been used in the z-test clearance comparison, a contaminated site would have been falsely released.

3439 (PB–89-221261/XAB) **Destruction of volatile organic compounds using catalytic oxidation. Report for April 1987-December 1988.** Kosusko, M.; Nunez, C.M. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. Dec 1988. 19p. (EPA–600/D-89/079). Available from NTIS, PC A03/MF A01.

This paper discusses the application of catalytic oxidation to four types of air-emission sources: ground-water stripping operations, graphic-arts facilities, flexographic printing plants, and latex-monomer production. Characteristics of each of these emissions are discussed, along with the catalytic technology used to control them. In addition to key emission-stream characteristics, the paper discusses hazardous air-pollutant characteristics that affect the applicability of catalytic oxidation.

3440 (PB–89-221279/XAB) **Use of bioassay methods to evaluate incinerator emissions.** Watts, R.R.; DeMarini, D.M.; Linak, W.P.; Lemieux, P.M.; McSorley, J.A. Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab. 1989. 14p. (EPA–600/D-89/068). Available from NTIS, PC A03/MF A01.

The organic components in combustion emissions are composed of thousands of chemicals. Analyzing such a complex mixture for the presence of even a few selected chemicals is difficult and provides information on only a fraction of the chemicals present. Reliance on such limited chemical analysis for determining possible health effects may ignore the contribution of many other chemical components of the effluent. Because combustion emissions are complex mixtures, they have been evaluated as such, rather than by studying a few selected chemicals that might be present. The Salmonella (Ames) assay was used to determine the mutagenicity associated with particles from the effluent of municipal-waste combustors, from ambient air collected near a municipal-waste combustor, and from the effluent of a pilot-sized rotary kiln in which polyethylene was combusted. Filter samples were extracted with dichloromethane, and concentrated extracts were solvent exchanged into dimethyl sulfoxide for bioassay.

3441 (PB–89-221287/XAB) **Mobile air-conditioner refrigerant evaluation. Report for April 1988-March 1989.** Harmon, D.L.; Rhodes, W.J.; Weitzman, L. Acurex Corp., Research Triangle Park, NC (USA). Mar 1989. 17p. Available from NTIS, PC A03/MF A01.

This paper discusses an evaluation of refrigerant from mobile air conditioners. The data gathered indicate that CFC-12 refrigerant does not degrade significantly with use. Furthermore, while small amounts of contaminant are removed with the refrigerant during servicing, most of the contaminants remain with the compressor oil. Current servicing practices do not require that the compressor oil be

changed unless the compressor is replaced. The presence of HCFC-22 in concentrations above the specification for new CFC-12 (0.5%) is rare; it occurred in less than 1% of the 227 cars tested. HCFC-22 contaminant quickly leaks out of the automotive air conditioner through hoses and does not appear to cause operational problems while in the system.

3442 (PB–89-221337/XAB) **US and Canadian emissions inventory, 1985. Report for March-September 1988.** Tax, W.; Pahl, D.; Vena, F. Alliance Technologies Corp., Chapel Hill, NC (USA). 1988. 22p. Available from NTIS, PC A03/MF A01.

This paper discusses efforts by the U.S. and Canada to develop an accurate and highly detailed 1985 emissions inventory which focuses on three pollutants (SO_2, NOx, and VOCs) believed to play a critical role in the formation of acid deposition, and also includes information on species such as HCl, HF, NH3, and alkaline particulate matter. The 1985 emissions inventory is also designed to meet a number of research objectives for the U.S. National Acid Precipitation Assessment Program. The U.S. and Canadian data-collection methodologies exhibited differences in data formats, classifications of point and area sources, emission factors, source classification codes, units of measurement, key data elements, and quality-control checks. U.S. and Canadian modeling inventories differ in their respective grid sizes, allocation factors, and species classes for VOCs and total suspended particulates. The inventory methodologies used by each country were adapted and standardized to ensure consistent processing of data.

3443 (PB–89-221345/XAB) **Calcination of calcium hydroxide sorbent in the presence of SO_2 and its effect on reactivity. Report for October 1988-March 1989.** Jozewicz, W.; Kirchgessner, D.A. Acurex Corp., Research Triangle Park, NC (USA). 6 Apr 1989. 31p. Available from NTIS, PC A03/MF A01.

The paper discusses the calcination of $Ca(OH)_2$ sorbent in the presence of SO_2 and its effect on reactivity. When $Ca(OH)_2$ is calcined in an isothermal flow reactor with 300 ppm or less SO_2, the structure of the sorbent is characterized by retention of higher pore volumes and surface areas than when calcined in the absence of SO_2. When reinjected into the isothermal flow reactor (1000 C, 3000 ppm, 0.8 s), a higher level of reactivity with SO_2 is observed for the SO_2-modified calcine than for the unmodified sorbent. Structural evidence suggests that a slower initial rate of sintering in the modified calcine accounts for its enhanced reactivity. It is postulated that deposition of small amounts of CaSO4 on pore faces and along crystal boundaries retards the solid state diffusion process responsible for sintering. The effects on sintering and reactivity of various combinations of residence time (0.6 - 2.0 s) and SO_2 concentration (10 - 50 ppm) during precalcination have been tested.

3444 (PB–89-221352/XAB) **Bench-scale evaluation of calcium sorbents for acid-gas emission control. Report for October 1988-March 1989.** Jozewicz, W.; Chang, J.C.S.; Sedman, C.B. Acurex Corp., Research Triangle Park, NC (USA). Apr 1989. 29p. Available from NTIS, PC A03/MF A01.

This paper gives results of an evaluation of calcium sorbents for acid gas emission control for effectiveness in removing SO_2/HCl and SO_2/NOx from simulated incinerator and boiler flue gases which is used in municipal solid waste disposal. All tests were conducted in a bench-scale fixed-bed reactor simulating fabric filter conditions in an acid gas removal process. Reagent grade $Ca(OH)_2$ was used to establish baseline sorbent performance. Several additives were subsequently tested to determine optimum sorbent combinations for SO_2/NO control. As with SO_2/HCl, calcium silicate has been shown to be superior for SO_2/NO capture. Some implications for larger-scale process configurations and sorbent selection for HCl/SO_2/NO control are discussed.

3445 (PB–89-222665/XAB) **Effects of air pollutants on photosynthesis, vegetative growth, and development of grapevines in the San Joaquin Valley of California. Final report, February 1987-February 1989.** Williams, L.E.; Roper, T.R.; Brewer, R.F. California Univ., Davis, CA (USA). 25 Feb 1988. 44p. Available from NTIS, PC A03/MF A01.

Mature Thompson Seedless grapevines were exposed to charcoal-filtered air or ambient ozone in open-top field chambers near Fresno, CA. Chronic exposure to ambient ozone reduced net carbon dioxide assimilation rates an average of 9% through the season when compared to the filtered-air treatment. The initial slope of a carboxylation efficiency curve was less for the ambient ozone treatment compared to the filtered-air treatment. Individual leaves were exposed to ozone concentrations of 200, 400, or 600 ppb for 5 to 10 hours. No visual ozone damage was found. Exposure of leaves to 200 ppb ozone for 5 hours had no effect on photosynthesis. Photosynthesis was reduced approximately 50 to 80% respectively after 5 hours of exposure to 400 and 600 ppb ozone compared to the controls. There were no significant differences in vine-growth parameters, bud fruitfulness or yield between vines exposed to either filtered or ambient air. Net carbon dioxide assimilation rates for five of six potted grape cultivars exposed to 1.5 times ambient ozone concentrations were substantially less than for those grown in the charcoal-filtered air. The cultivar 'Barbera' had greater rates of photosynthesis at the higher ozone concentration.

3446 (PB–89-222715/XAB) **Effects of acid fog and ozone on conifers. Final report.** Bytnerowicz, A.; Olszyk, D.M.; Takemoto, B.K.; McCool, P.M.; Musselman, R.C. California Univ., Riverside, CA (USA). Statewide Air Pollution Research Center. May 1989. 162p. Available from NTIS, PC A08/MF A01.

This study evaluated the effects of acidic fog (pH 2.0, 3.0, or 4.0) on the physiological, biochemical, and growth responses of two coniferous tree species (Pinus ponderosa and Abies concolor), and determined if exposure to acidic fog predisposed the tree seedlings to the phytotoxic effects of ozone (O_3). Results provide evidence that the growth and metabolic responses of two coniferous tree species could be altered by multiple applications of acidic fog, and by exposure to ambient O_3. In general, the alterations were slight to modest, which may be attributed to the low degree of stress severity, and the slow rate of tree growth. The findings indicate that exposure to acidic fog followed by O_3 does not cause detectable changes in conifer seedling growth within a single-growing season. Nevertheless, it is clear that acidic fog and O_3 cause temporal alterations in seedling physiology and biochemistry.

3447 (PB–89-222723/XAB) **Pilot investigation of indoor-outdoor and personal PM10 (thoracic) and associated ionic compounds and mutagenic activity. Final report, February 1987-April 1989.** Colome, S.D.; Kado, N.Y.; Kleinman, M.; Jaques, P. California Univ., Irvine, CA (USA). Public Policy Research Organization. 27 Apr 1989. 126p. Available from NTIS, PC A07/MF A01.

A major objective of the pilot study was to evaluate methods of measuring indoor and personal exposures to PM10. Other objectives were to examine the feasibility of measuring particle characteristics (other than mass) that may be useful in relating exposures to PM10 to health effects. The investigators tested several types of particle-sampling devices in the homes of eight asthmatic subjects who resided in Orange County. The investigators measured particle mass for levels of sulfate/nitrate ions and the mutagenicity of particle extracts. The pilot study demonstrated successfully the use of certain portable sampling devices to measure PM10 exposure and showed that it is feasible to measure levels of ionic species and mutagenic activity in particle samples obtained with these devices. The results of the study can be applied in the design of larger studies of similar nature.

3448 (PB–89-223341/XAB) **Indoor air quality: Selected references.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). May 1989. 61p. Available from NTIS, PC A04/MF A01.

Also available from Supt. of Docs.

This document was compiled in response to an increasing number of requests for information about indoor air quality, including sick-building syndrome. Included in the publication are the NIOSH Congressional testimony presented before the Subcommittee on Energy Development and Applications; two articles describing the results of NIOSH research and findings on indoor air-quality problems; NIOSH guidance on conducting indoor-air-quality investigations; and a description of the NIOSH health-hazard evaluation program, which can provide NIOSH assistance in evaluating indoor-air-quality problems.

3449 (PB–89-223721/XAB) **Integration of fluid modeling with complex-terrain field studies and model-development efforts.** Snyder, W.H. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. 22 Feb 1988. 6p. (EPA–600/D-89/036). Available from NTIS, PC A02/MF A01.

EPA's Complex Terrain Model Development Program (CTMDP) was designed to develop reliable atmospheric dispersion models applicable to large pollutant sources located in complex terrain. The primary emphasis was on plume impaction on nearby hills during nighttime stable conditions. EPA's Fluid Modeling Facility (FMF) interacted closely with the model developers participating in the CTMDP and provided support in various ways through the conduct of a wide range of laboratory studies. Work at the FMF prior to the inception of the program provided the basic framework for the model, the dividing-streamline concept, and the focal point around which the field program was designed. At the beginning of the program, the FMF provided direct support as an aid to planning the details and strategies of the field experiments and testing the limits of applicability of the dividing-streamline concept. Later work included exercises of filling in the gaps in the field data, furthering the understanding of the physical mechanisms important to plume impaction in complex terrain and in stably stratified flows in general, testing various modeling assumptions, providing data for calibration of various modeling parameters, and testing the ability of the laboratory models to simulate full-scale conditions.

3450 (PB–89-223960/XAB) **Air toxics control situation room. Report for July 1988-March 1989.** Ponder, W.H.; Nunez, C.M. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1989. 22p. (EPA–600/D-89/088). Available from NTIS, PC A03/MF A01.

This paper describes one component of the Environmental Protection Agency's (EPA's) efforts to assist state and local environmental agencies and its own regional offices in response to their increased responsibilities for planning, evaluating, and approving control approaches for reducing emissions of volatile organic compounds (VOCs) and hazardous air pollutants (HAPs). This component is EPA's air toxics control 'situation room'. This is a complex and difficult job, and EPA's guidance and assistance are often sought. Hundreds of sources emit thousands of ozone-producing and toxic pollutants in the U.S. A major concern is the possibility that some of these compounds may cause cancer. In addition, these toxic air pollutants damage materials and cause crop/forest losses. Thus, state and local environmental officials must also assume responsibility for protecting people and the environment from the effects of these pollutants.

3451 (PB–89-224463/XAB) **Evaluation of airborne-asbestos concentrations before and during an O and M (operations and maintenance) activity: A case study.** Kominsky, J.; Freyburg, R. PEI Associates, Inc., Cincinnati, OH (USA). Aug 1989. 34p. Available from NTIS, PC A03/MF A01.

The current lack of information regarding the impact of O&M activities on the potential for asbestos exposure to building staff and occupants prompted this study. This report presents a statistical evaluation of airborne-asbestos data collected before and during an O&M activity involving removal of thermal surface insulation from a feedwater preheater tank in a boiler room. It also presents a comparison of transmission electron microscopy (TEM) analysis on 0.4 micrometer-pore-size polycarbonate and TEM analysis on 0.8 micrometer-pore-size mixed cellulose ester membrane filters. Containment barriers should be designed and maintained for effective prevention of significant increases in airborne asbestos concentrations in the areas adjacent to an O&M activity.

3452 (PB–89-224471/XAB) **Source characterization and control technology assessment of methylene chloride emissions from Eastman Kodak Company, Rochester, NY. Final report, July 1988-April 1989.** Walata, S.A.; Rehm, R.M. Alliance Technologies Corp., Chapel Hill, NC (USA). Jul 1989. 104p. Available from NTIS, PC A06/MF A01.

This report gives results of an assessment of potential control technologies for methylene chloride (also known as dichloromethane or DCM) emission sources at Eastman Kodak Company's Kodak Park facility in Rochester, NY. DCM is a solvent used by Kodak in the manufacture of cellulose triacetate film support. Work has involved: a plant visit where major DCM emission sources were inspected, and evaluation of current and potential control technologies for the DCM emission sources. The report contains information gathered during the plant visit to the Kodak Park facility. Included are emission estimates determined by Kodak of all emission points greater than 8000 lb (3600 kg)/yr DCM, as well as a description of each point observed during the visit. Also included are results of an evaluation of control technologies that might be applied to the major emission sources. A cost analysis of different add-on control devices is provided for four of the uncontrolled emission points.

3453 (PB–89-224943/XAB) **Sensitivity of a regional oxidant model to variations in climate parameters. Volume 1 and 2. Final report.** Morris, R.E.; Gery, M.W.; Liu, M.K.; Moore, G.E.; Daley, C. Systems Applications, Inc., San Rafael, CA (USA). Jul 1989. 149p. Available from NTIS, PC A07/MF A01.

In order to investigate the sensitivity of ozone concentrations to future climate variations, a regional oxidant model was applied for future climate scenarios to two regions: one covering central California (San Joaquin Valley, Sierra Nevada mountains and the San Francisco Bay Area) and the other covering the midwestern and southeastern United States. Based on model calculations, the effects of increased temperature on ambient ozone concentrations results in an increase of the area of exceedances of the ozone air-quality standard, a movement of the peak ozone concentration closer to the urban areas, and the resultant increase in the exposure of people to harmful levels of ozone concentrations. The calculations for California indicate that the maximum daily ozone concentrations may increase from 2 to 20% and the number of people exposed to hourly ozone concentrations in excess of the air-quality standard may triple as a result of a temperature increase. Similar, although less-dramatic, results were seen for the midwestern and southeastern applications.

3454 (PB–89-225601/XAB) **Use of micrometeorological parameters in the establishment of a VOC (volatile organic compounds) monitoring network. Technical report (Final).** Thomas, M. Kansas State Biological Survey, Lawrence, KS (USA). 1988. 25p. Available from NTIS, PC A03/MF A01.

Portions of this document are not fully legible.

As part of an ongoing volatile organic compounds (VOC) ambient air sampling network study using whole-air samplers, this report evaluates the uses of meteorological data in a VOC ambient-air-sampling activity. The report determines the minimum requirements, type of, and usage procedures for meteorological instruments and the ways in which synoptic and on-site meteorological data can be integrated into an overall VOC sampling study. The report would be of interest to those persons interested in the procedures necessary to integrate meteorological data into a VOC ambient-air-emission study. Conclusions based on the study indicate that a detailed understanding of synoptic and on-site meteorology is a critical factor in selecting days for a successful VOC ambient-air-sampling test. Several minimum meteorological instrumentation requirements are needed, one of which is a tripod-based, portable station with a self-contained power source. Real-time viewing and electronic-data logging of the wind speed and direction, as well as temperature and relative humidity, will allow the definition and verification of the sampling-network centerline.

3455 (PB–89-226856/XAB) **Physical characteristics of study plots. Across-a-Lake States acidic-deposition gradient. Forest Service resource bulletin.** Ohmann, L.F.; Grigal, D.F.; Brovold, S. Forest Service, St. Paul, MN (USA). North Central Forest Experiment Station. 1989. 53p. (FSRB-NC–110). Available from NTIS, PC A04/MF A01.

Some people in the United States are concerned that atmospheric pollutants may be affecting the health of the Nation's forests (Barnard 1986). In response to that concern, the authors began research on the relations between forest conditions and atmospheric deposition across the Great Lakes region in 1985. The research consisted of a series of studies to describe: (1) the relations between sulfate (SO_4) deposition in precipitation and soil and tree woody-tissue chemistry; and (2) the interaction among wet deposition, soil, tree woody-tissue chemistry, climate, and tree and plot growth (Ohmann et al. 1987, 1988; Holdaway 1988).

3456 (PB–89-227847/XAB) **Sentinel Event Notification System for Occupational Risks (SENSOR): Recommendations for control of silica exposure at Woodbridge Sanitary Pottery Corporation, Woodbridge, New Jersey.** Caplan, P.E.; Valiante, D.; Cooper, T.C.; Crouch, K.G.; Gideon, J.A. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jun 1989. 81p. (ECTB–171-11B). Available from NTIS, PC A05/MF A01.

An in-depth survey of exposure to silica dust at the Woodbridge Sanitary Pottery Corporation, Woodbridge, New Jersey was conducted as a part of the Sentinel Event Notification System for Occupational Risks (SENSOR) cooperative effort. The facility manufactured vitreous china products, including toilet bowls and lavatories. Personal and area atmospheric sampling showed that personal exposure to respirable crystalline silica dust ranged from 0.12 to 0.18 mg/m^3 with at least half the samples exceeding the NIOSH recommended exposure limit of 0.05 mg/m^3 for crystalline silica. The workers in the Slip House suffered the highest exposures, where area concentrations averaged 0.38 mg/m^3. Of the other three areas, casting, glaze spraying, and glaze preparation, the highest personal exposures were in the glaze-spraying areas where 67% of the personal samples exceeded the OSHA permissible exposure limits for respirable dust. Ergonomic evaluations were conducted to determine lifting hazards at several workstations. The authors conclude that there were excessive exposures to respirable silica dust and respirable dust. There was also a high risk of lost time in injuries from manual handling of heavy loads. Improvements should be made in the design and maintenance of ventilation control systems, work stations, and work practices.

3457 (PB–89-228720/XAB) **Health-hazard evaluation report HETA-88-244-1951, Orrville Bronze and Aluminum Company, Orrville, Ohio.** Montopoli, M.; Seligman, P.; O'Brien, D.; Zaebst, D. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Mar 1989. 26p. (HETA–88-224-1951). Available from NTIS, PC A03/MF A01.

An investigation was made of possible hazardous working conditions at the Orrville Bronze and Aluminum Company, Orrville, Ohio. Medical screening at the site had recently discovered a worker with a blood lead level in excess of 100 micrograms/deciliter (microg/dl) and seven workers with blood lead levels in excess of 40 microg/dl. The facility was a nonferrous foundry specializing in small- to medium-sized bronze, brass, and copper castings. Lead concentrations in six personal breathing-zone samples ranged from 38 to 520 micrograms/cubic meter (microg/m^3). Airborne copper levels ranged from 26 to 2601 microg/m^3. Airborne zinc concentrations ranged from 291 to 3165 microg/m^3. Three of 18 workers had blood lead levels in excess of 60 microg/m^3, the OSHA level which requires immediate medical removal protection. The report concludes that lead and copper exposures represented a serious health hazard to workers. Measures to reduce exposures, including engineering controls, work practices, and housekeeping are recommended.

3458 (PB–89-230247/XAB) **Health-hazard evaluation report HETA 87-109-1950, North Riverside Fire Department, North Riverside, Illinois.** Zey, J.N.; Richardson, F. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Mar 1989. 24p. (HETA–87-109-1950). Available from NTIS, PC A03/MF A01.

An assessment was made of the toxicity of smoke clouds produced by a zinc chloride smoke-generating device used in training exercises at the Fire Training Facility of the North Riverside Fire Department, North Riverside, Illinois. Analysis indicated that the smoke contained hydrochloric acid, zinc compounds, and several chlorinated hydrocarbons. Evaluations were made during two separate training exercises. Hydrochloric-acid concentrations ranged from trace amounts to 44 mg/m^3, exceeding the OSHA recommended ceiling level criteria of 7 mg/m^3. Zinc-chloride concentrations ranged from 63 to 172 mg/m^3; the limit was 2 mg/m^3. Zinc-chloride concentrations ranged from up to 62 mg/m^3. The amount of smoke generated for the exercise significantly surpassed that recommended by the manufacturer. Five and six participants in the two exercises experienced symptoms including breathing difficulty, joint pain, fever and chills, and general fatigue. These individuals were not wearing a respirator or had removed it as a part of the drill. The report concludes that the dense clouds created by the smoke-generating devices should be considered hazardous to individuals without respiratory protection and recommends the use of a self-contained breathing apparatus during training exercises.

3459 (PB–89-230254/XAB) **Health-hazard evaluation report HETA 88-372-1953, Barbados Ministry of Health, Bridgetown, Barbados.** Crandall, M.S.; Fleeger, A.K. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Mar 1989. 39p. (HETA–88-372-1953). Available from NTIS, PC A03/MF A01.

In response to a request from the Pan American Health Organization to investigate the potential for exposure to asbestos among workers and the general public on Barbados, NIOSH investigators visited five sites preselected for evaluation. These included the Treasury Building, Queen Elizabeth Hospital, St. Leonard's Secondary School, a sugar factory and a vehicle repair shop. At all sites, except the vehicle maintenance shop, asbestos containing materials were identified by bulk sample analysis. Both amosite and chrysotile asbestos fibers were found. All but one of the settled dust samples were negative, suggesting good housekeeping procedures were in place. General air concentrations of fibers were low at the time of the visits. The authors conclude that asbestos constituted a hazard since it was widely used and highly accessible to workers and the general public in Barbados. Specific measures to control asbestos are recommended.

3460 (PB–89-233464/XAB) **Re-examination of interim estimates of annual sulfur dry deposition across the eastern United States. Final report, 1988-1989.** Clark, T.L.; Dennis, R.L.; Seilkop, S.K. Analytical Sciences, Inc., Research Triangle Park, NC (USA). Jun 1989. 42p. Available from NTIS, PC A03/MF A01.

During the summer of 1987, annual amounts of sulfur dry deposition were first estimated for more than 7,000 lakes in the northeastern United States. These estimates, heretofore termed interim estimates since they were expected to be superseded in the near future, were derived from predictions of the Regional Acid Deposition Model (RADM) adjusted using the empirical data from two monitoring networks. In this report the authors compare the dry-deposition predictions from the three models (RADM, RELMAP and ASTRAP) to the available empirically-derived estimates to ascertain which of these models most accurately represents the spatial pattern of sulfur dry deposition. Using one of these models in conjunction with the available data, they then recommend systematic revisions to the interim estimates. The uncertainty and bias in these revised estimates are characterized relative to interannual variability in the empirically-estimated amounts of sulfur dry deposition, and distance of sites from the emission-source regions.

3461 (PB–89-863856/XAB) **Asbestos and silicate pollution in the work place. January 1978-July 1989 (Citations from Pollution Abstracts). Report for January 1978-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 64p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning occupational exposure to asbestos and silicate fibers in the work place. Correlations are cited between occupational exposure, carcinogenesis, and mortality. Included are surveys of occupational exposure of shipyard and dockyard workers; mechanics; miners; insulation workers; sheet metal workers; millers; and workers in pottery mills, foundries, chemical industry and power stations. Surveys and health examinations are reported for workers and family members whose exposure results from the worker. Asbestos and silicate pollution exposure standards, and hazard control technology are cited. References to nonoccupational asbestos and silicate pollution are excluded and can be found in other published bibliographies. (Contains 132 citations fully indexed and including a title list.)

3462 (PNL–7163) **International aspects of restrictions of ozone-depleting substances.** McDonald, S.C. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 54p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. Order Number DE90001813. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report summarizes international efforts to protect stratospheric ozone. Also included in this report is a discussion of activities in other countries to meet restrictions in the production

and use of ozone-depleting substances. Finally, there is a brief presentation of trade and international competitiveness issues relating to the transition to alternatives for the regulated chlorofluorocarbons (CFCs) and halons. The stratosphere knows no international borders. Just as the impact of reduced stratospheric ozone will be felt internationally, so protection of the ozone layer is properly an international effort. Unilateral action, even by a country that produces and used large quantities of ozone-depleting substances, will not remedy the problem of ozone depletion if other countries do not follow suit. 32 refs., 7 tabs.

3463 (PNL–7166) **Evaluate and characterize mechanisms controlling transport, fate, and effects of army smokes in the aerosol wind tunnel: Transport, transformations, fate, and terrestrial ecological effects of hexachloroethane obscurant smokes: Final report.** Cataldo, D.A.; Ligotke, M.W.; Bolton, H. Jr.; Fellows, R.J.; Van Voris, P.; McVeety, B.D.; Li, Shu-mei W.; McFadden, K.M. Pacific Northwest Lab., Richland, WA (USA). 1 Sep 1989. 195p. Sponsored by U.S. Department of Defense; U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE90002923. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The terrestrial transport, chemical fate, and ecological effects of hexachloroethane (HC) smoke were evaluated under controlled wind tunnel conditions. The primary objectives of this research program are to characterize and assess the impacts of smoke and obscurants on: (1) natural vegetation characteristic of US Army training sites in the United States; (2) physical and chemical properties of soils representative of these training sites; and (3) soil microbiological and invertebrate communities. Impacts and dose/responses were evaluated based on exposure scenarios, including exposure duration, exposure rate, and sequential cumulative dosing. Key to understanding the environmental impacts of HC smoke/obscurants is establishing the importance of environmental parameters such as relative humidity and wind speed on airborne aerosol characteristics and deposition to receptor surfaces. Direct and indirect biotic effects were evaluated using five plant species and two soil types. HC aerosols were generated in a controlled atmosphere wind tunnel by combustion of hexachloroethane mixtures prepared to simulate normal pot burn rates and conditions. The aerosol was characterized and used to expose plant, soil, and other test systems. Particle sizes of airborne HC ranged from 1.3 to 2.1 μm mass median aerodynamic diameter (MMAD), and particle size was affected by relative humidity over a range of 20% to 85%. Air concentrations employed ranged from 130 to 680 mg/m^3, depending on exposure scenario. Chlorocarbon concentrations within smokes, deposition rates for plant and soil surfaces, and persistence were determined. The fate of principal inorganic species (Zn, Al, and Cl) in a range of soils was assessed.

3464 (PNL-SA–17385) **Air quality monitoring at toxic waste sites: A Hanford perspective.** Laws, G.L.; Glantz, C.S. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 10p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891053–11: 28. Hanford life sciences symposium on environmental monitoring, restoration and assessment: what have we learned?, Richland, WA (USA), 16-19 Oct 1989). Order Number DE90002727. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Air quality monitoring is being conducted as part of remedial investigation activities at waste sites in the 1100-EM-1 Operating Unit at the US Department of Energy's Hanford Site. Sampling is being conducted for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs) (including pesticides and PCBs), metals, and asbestos. The monitoring program is being conducted in three phases: before, during, and after intrusive remedial investigation activities. At each waste site, battery-powered monitoring equipment is positioned at one location upwind of the site (to measure background concentrations of pollutants) and typically at two locations downwind of the site. Control samples are used to identify sample contamination that may occur during handling or analysis. All samples are analyzed using methods approved by the US Environmental Protection Agency. The results from the first phase of sampling have been assessed and are being used to upgrade sampling and laboratory analysis procedures. 5 refs.

3465 (RFP–4376) **Development of a hazardous materials dispersion modeling capability with application to ambient air monitoring network design: Project plan.** Hodgin, C.R. Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant. 7 Jul 1989. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP03533. Order Number DE90002286. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Rocky Flats Plant is applying the Terrain Responsive Atmospheric Code (TRAC) for developing a monitoring network design for airborne hazardous materials around the Rocky Flats site. This project is being implemented in response to a recent agreement between the State of Colorado and the Department of Energy. The Hazardous Materials version of TRAC (and resulting monitor siting plan) will be developed in a series of 63 tasks which will involve modification of the TRAC model to account for continuous emissions, source configuration and hazardous material. After testing these modifications, a long-term archival meteorological data base will be implemented and used to produce the monitoring design. 2 figs.

3466 (STEV-FBT–89-25) **Emission of nitrogen oxide from a circulating fluidized bed boiler - the influence of design parameters.** Aamand, L.E.; Leckner, B. Statens Energiverk, Stockholm (Sweden). 1989. 9p. (CONF-880302–1: 2. International conference on circulating fluidized bed boilers, Compiegne (France), 14-18 Mar 1988). Order Number DE90719435. Available from NTIS (US Sales Only), PC A02/MF A01.

In a circulating bed with limestone addition, the oxidation of nitrogen containing volatiles causes an increased emission of nitrogen oxide. This effect can be mitigated by avoiding excess addition of limestone in relation to the sulphur content of the fuel or by arranging the air supply in a suitable way, thus decreasing the oxidation of ammonia.

3467 (SVF–336) **Experiences of DOAS technique for flue gas measurements.** Vessely, V.; Nyquist, G.; Jansson, C. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden); National Swedish Environmental Protection Board, Solna (Sweden). May 1989. 82p. (In Swedish). (SNV–3609). Order Number DE90719408. Available from NTIS (US Sales Only), PC A05/MF A01.

The DOAS (Differential Optical Absorption Spectroscopy) technique is an optical in situ method for determination of certain gaseous pollutants. Field tests of such a system for emission measurements were performed at three different combustion plants (fuel: pulverized coal, oil and, refuse). The measured flue gas pollutants were SO_2, NO, NO_2 and Hg. Simultaneously, continuous measurements of SO_2, NO and NO_x with a stack gas diluting system were carried out.

3468 (UCID–21682) **Beryllium dispersion near explosive firing tables: A comparison of computed and observed results.** Shinn, J.H.; Cederwall, R.T.; Lamson, K.C.; Mitchell, C.S. Lawrence Livermore National Lab., CA (USA). Jul 1989. 57p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90002635. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

We have demonstrated that evaluation of vertical atmospheric Be profiles, extensive deposition samples, a few strategically located air concentration measuring devices, and ambient meteorological conditions can be used to characterize the high-explosives tests at Site 300. Our application of modeling simulation using the detailed description of Be particle-size and air concentrations in the stem and cap cloud formed during a detonation has resulted in a high level of physical realism and objectivity in the assessment of downwind Be deposition and short-term elevated air concentrations. 46 refs., 18 figs., 3 tabs.

3469 (UCRL–101996) **In situ optical measurements of hydrofluoric acid aerosols.** Holve, D.J.; Harvill, T.L.; Schatz, K.W.; Koopman, R.P. Lawrence Livermore National Lab., CA (USA). Sep 1989. 36p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8908168–2: AIChE meeting on controls of accidental releases of hazardous gases, Philadelphia, PA (USA), Aug 1989). Order Number DE90002108. Available from NTIS, PC A03/MF A01 - OSTI.

HF aerosol measurements were obtained in a specially developed flow chamber with a cross-section of 8 x 16 feet, and approximately 140 feet long. The primary objective was to determine the extent of HF aerosol mist formation in a potential accidental release of HF. A newly developed in situ optical instrument (PCSV-P) was used to obtain on-line measurements of the aerosol. A total of 86 usable aerosol data sets were obtained during the test period. As many as 10 data sets were acquired for an 11 minute duration HF release. Briefly summarizing the results, the PCSV-P measured predominately submicron aerosols at the exit of the sharp-edged orifice. The aerosol then grew to larger particles at the outlet of the flow chamber. This result points to the formation of an aerosol through vaporization-condensation as opposed to a conventional shear spray. Temperature, humidity, release pressure, radial position in the plume, and type of acid did not appear to have an significant effect in the measured size distributions for the range of conditions investigated. 7 refs., 23 figs., 2 tabs.

3470 **National report for the Netherlands. The IEA energy technology systems analysis project (ETSAP)/Annex 3.** Kram, T.; Okken, P.A. 49p. Netherlands Energy Research Foundation ECN, Petten (NL) (Oct 1989).

During the current phase of ETSAP, several national energy/environment and technology assessment studies have been carried out, using the MARKAL model as the main tool for integral analysis. The work was sponsored by the Ministry of Economic Affairs and by NOVEM, the Netherlands Agency for Energy and Environmental R, D and D Management. An overview is given of the main results of these studies, which were also presented at earlier ETSAP workshops and joint meetings with other international projects. More detail can be found in the publications (1-7) in the list of references. The studies initially concentrated upon the emission of acidifying agents from the energy system (SO_2 and NO_x) and ways to reduce these emissions. From 1988 the emphasis shifted towards the greenhouse effect, in particular the emission of CO_2 from burning fuels. 24 figs., 13 refs., 6 tabs., 2 apps.

3471 **Seasonal climatic changes induced by doubled CO_2 as simulated by the OSU atmospheric GCM/mixed-layer ocean model.** Schlesinger, M.E. (Department of Atmospheric Sciences and Climatic Research Institute, Oregon State University, Corvallis, Oregon (US)); Zhao Zong-ci. *Journal of Climate (USA)*, 2(5): 459-495 (May 1989).

The OSU global atmospheric general circulation model (AGCM) has been coupled to a 60-m deep mixed-layer ocean model to simulate the equilibrium seasonal climatic changes induced by a doubling of the CO_2 concentration. Simulations with CO_2 concentrations of 326 ppmv ($1\times CO_2$) and 652 ppmv ($2\times CO_2$) were performed using an accelerated integration procedure for 45 solar cycles followed by the normal unaccelerated integration procedure for 24 and 16 solar cycles (years), respectively. Averages were then obtained over the last 10 yr of each simulation and were analyzed in terms of the annual-mean climate and the annual cycle of climate, the latter defined as the departure of the monthly or seasonal mean from the corresponding annual mean.

3472 **An acid rain study in the Washington, D.C. area.** Patrinos, A.A.N. (Atmospheric Sciences Division, Brookhaven National Laboratory, Upton, New York (US)); Leach, M.J.; Brown, R.M.; Tanner, R.L.; Binkowski, F.S. *Journal of Applied Meteorology (USA)*, 28(9): 948-968 (Sep 1989). DOE Contract AC02-76CH00016.

A field study in the Washington, D.C. area explored the impact of urban emissions and mesoscale meteorology on precipitation chemistry. The study was a follow-up to an earlier, considerably more industrialized, study in the Philadelphia area; emissions along the Delaware Valley were found to affect the deposition of nitrate and sulfate on the urban mesoscale. The Washington studies were designed to complement and enhance the earlier study with an expanded sampling domain, sequential precipitation sampling and airborne measurements. Four storms were sampled successfully between October 1986 and April 1987. Results appear to confirm the conclusions of the Philadelphia study, although the upwind–downwind contrast in nitrate and sulfate deposition is not as pronounced. This difference is attributed to the area's widely distributed emission patterns and to the prevailing theories regarding the production of nitric acid and sulfric acid on the relevant time and space scales. The importance of mesoscale meteorology and hydrogen peroxide availability is highlighted in at least two of the sampled storms.

3473 **Concentration profiles from lidar measurements in the presence of multiple scattering: the two-stream approximation.** Ayoubi, I.S. (Texas A&M University, Departments of Mathematics, and Nuclear Engineering, College Station, Texas 77843-3133 (US)); Nelson, P. *Applied Optics (USA)*, 28(19): 4133-4140 (1 Oct 1989).

We consider the problem of obtaining, from monostatic lidar measurements, the concentration profile for a medium of known scattering properties. Invariant imbedding methods are applied to the two-stream approximation to the radiative transfer equation in one dimension, to obtain a nonlinear integrodifferential equation that takes account of multiple scattering events, and whose solution yields the desired profile. A discretization scheme for this equation is presented, along with results from using it to solve two sample problems. The stability of this inversion scheme in the face of noisy signals is also explored.

3474 (AD-A–210518/7/XAB) **Assessment of global atmospheric effects of a major nuclear conflict. Final report, 1 February 1984-31 May 1987.** Muench, H.S.; Banta, R.M.; Brenner, S.; Chisholm, D.A. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 10 May 1988. 90p. (AFGL-TR–88-0217). Available from NTIS, PC A05/MF A01.

In 1983, evidence started emerging that a major nuclear conflict could result in substantial weather changes over vast regions of the globe, including severe surface cooling over the continents. Refined projections of the density and horizontal extent of persistent layers of smoke (soot) led to revised estimates of the magnitude of the postulated surface cooling. The impact to the post-attack environment (even given the range of uncertainty due to the assumptions made) implied heretofore unrecognized consequences to the quality of life in vast regions and to effective national defense planning and execution. Subsequent studies sought to reduce the uncertainties in the calculations, by clarifying some assumptions and replacing others with more complete and newer scientific data. They have resulted today in assessments which, while indicating smaller surface-temperature effects than previous studies for a given amount of soot, do document with increased scientific certainty that secondary consequences of a nuclear exchange would complicate the quality of life of survivors for extended periods and over areas well removed from the geographic region directly involved in the exchange. The resulting period of abnormal optical path lengths due to smoke (soot) would also complicate national defense contingencies.

3475 (CNEN-NE–1.22) **Programs of meteorology in support of nuclear power plants.** Coutinho, M. de F.F.; Miyamoto, A.; Nicoli, D. Comissao Nacional de Energia Nuclear, Rio de Janeiro, RJ (Brazil). Dept. de Normas e Especificacoes. Jul 1989. 31p. (In Portuguese). (DNE–41). Available from Centro de Informacoes Nucleares of the Comissao Nacional de Energia Nuclear, RJ, Brazil.

The objective of this norm is to establish minimum requirements for that the programs of meteorology in support of nuclear power plants, can be adequate to the obtention and application of feasibility information and data for emergency situations.

3476 (IPPJ-DT–146) **Measurements of environmental radiations and radioactivities in Toki, 5.** Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. 113p. (In Japanese). Order Number DE90719715. Available from NTIS (US Sales Only), PC A06/MF A01.

The booklet carries six reports. The first report, titled 'Measurements of Environmental Radiation in 1986 and 1987', consists of two parts: 'A report of TLD Measurement of Environmental Radiations in the Toki Area' and 'Measurement of Environmental Radiations at the Higashiyama and Toki Sites'. Measurements of environmental radiations made at various points throughout the area are presented. The second report, titled 'Environmental Tritium

Measurements in Toki Area', presents measurements of environmental tritium made at various points in the Toki area. The third study addresses the 'Radioactivity in Rain Associated with Chernobyl Nuclear Reactor Accident'. Rain is collected on the roof of the Institute of Plasma Physics, and gamma ray measurements are made with a germanium detector. The concentrations of radioactive fallout substances are analyzed. Then, the relations of the concentrations with the spatial dose rate is investigated. The fourth work deals with the 'Concept and Mutual Relation of Radiation-Related Quantities'. The fifth report outlines a 'System for Radiation Monitoring around Accelerator'. The sixth report describes some features of the National Lab. for High Energy Physics (KEK). (N.K.).

3477 (IPPJ-DT–147) **Measurements of environmental radiations and radioactivities in Toki, 6.** Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. 51p. (In Japanese). Order Number DE90719714. Available from NTIS (US Sales Only), PC A04/MF A01.

The booklet carries five reports. The first one, titled 'A Study on Nuclear Fusion Environmental Safety in the Nagoya University, Institute of plasma physics', deals with the design and development of a radiation monitoring system and a tritium monitoring system. The second work, titled 'Measurement of Environmental Radiations', consists of two parts: 'A report on TLD Measurement of Environmental Radiations in the Toki Area' and 'TLD Measurement in Toki Area (1982-1988)'. Measurements of environmental radiations made at various points throughout the area are presented. The third study addresses 'Radioactivity in Rain Associated with Chernobyl Nuclear Reactor Accident'. Rain is collected on the roof of the Institute of Plasma Physics, and gamma ray measurements are made with a germanium detector. The concentrations of radioactive fallout substances are analyzed. Then, the relations of the concentrations with the spatial dose rate is investigated. The fourth report, titled 'Measurements of Environmental Tritium Concentration in the Toki Area', deals with measurements made at various points throughout the area are listed. The fifth and last report briefly outlines some features of the Kyoto University Plasma Physics Laboratory and the Osaka University Institute of Laser Engineering. (N.K.).

3478 (IVL-B–912) **Monitoring of air pollution in the southern counties.** Westling, O.; Loevblad, G. Swedish Environmental Research Inst., Stockholm (Sweden). Nov 1988. 37p. (In Swedish). Order Number DE90719421. Available from NTIS (US Sales Only), PC A03/MF A01.

The amount of atmospheric deposition and its influence on forest land are monitored in Southern Sweden. Deposition, soil water, soil chemistry and content of heavy metals in mosses are regularly controlled since 1984. Results from this survey indicate that load of sulphur varies from 9 to 35 kg per hectare and year. This is to be compared with 5 kg, regarded as critical load for sulphur. Nitrogen deposition does not exceed the critical load. Soil acidification and leakage of aluminium occurs in all counties. Large amount of nitrogen in soil waters are observed in coastal areas. (authors).

3479 (JAERI-M–89-082) **Verification study of a three-dimensional local scale atmospheric model PHYSIC at seacoast region.** Yamazawa, Hiromi. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1989. 48p. Order Number DE90719560. Available from NTIS (US Sales Only), PC A03/MF A01.

The performance of a three-dimensional numerical atmospheric model (PHYSIC) was examined over a seacoast region with the data observed during the field tracer experiment at the Tokai site. The main frame of PHYSIC is made up of the momentum equations with the hydrostatic and Boussinesq approximation, the second-order turbulence closure model level 2.5 by Yamada and other basic equations of physical processes in the atmosphere. A terrain following Z_* coordinate system is used. The present model successfully predicts the temporal change of wind field within twenty hours from the evening to the next noon. The occurrence and structure of sea breeze are simulated satisfactorily. The model performance concerning the eddy diffusivities is thought to be reasonable, although the direct comparison between the calculation and observation is restricted to the wind and temperature profiles by the limited observation data. This was supported by an additional calculation with a diagnostic model of turbulence quantities. (author).

3480 (JET-R–89-06) **Model for calculating room air and surface tritium concentrations.** Brereton, S.J.; Gordon, C.W. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. May 1988. 23p. Order Number DE90608185. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A mathematical model and the resultant analytical solutions for calculation of transient tritium concentrations in room air and in solid surfaces are presented. Although more elaborate models exist for describing the behaviour of tritium released into enclosures, a simpler approach was considered adequate for a preliminary assessment of situations arising at JET. A comparison to experimental data and several cases of interest are also presented. These preliminary checks have confirmed that the basic approach is sound. Further checks and refinement may be required to cover the full range of practical situations. (author).

3481 (KFK–4447) **Uncertainty analyses for the atmospheric dispersion submodule of UFOMOD with emphasis on parameter correlations.** Fischer, F.; Paesler-Sauer, J.; Raicevic, J. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projektgruppe LWR-Sicherheit (PRS). Aug 1989. 131p. Contract CEC BI6/F/128/D. Order Number DE90722280. Available from NTIS (US Sales Only), PC A07/MF A01.

Special emphasis is put on some helpful theoretical investigations concerning: 1. different types of correlation between uncertain model parameters; 2. test procedures to find out the most sensitive uncertain model parameters; 3. the percentage contribution of parameter variations to changes in consequence values. For the mentioned submodule of the new program system UFOMOD version NE 87/1, the most important parameters are stable in their rankings regardless of the underlying distributions (predefined by experts or all uniformly distributed, respectively). For the less important parameters the values of the sensitivity measures (PRCC values) vary for predefined or uniform distributions, respectively. But even then in most cases the ranking is the same. Increasing sample sizes (n = 80, 100) lead to more precision in sensitivity calculations, i.e. lead to a decrease of the critical 'white noise level' (garbage level) of absolute PRCC values. R^2-values (coefficients of determination) in conjunction with the corresponding PRCC values visualize the percentage contribution of each uncertain model parameter (or groups of uncertain parameters) to uncertainty in consequences. This is important, because a large absolute PRCC value is not in every case an indication for a considerable amount of responsibility for uncertainty in consequences. The restriction to pure model parameters and revised parameter variations in the atmospheric dispersion and deposition submodule of the new UFOMOD code system lead to significantly smaller uncertainty bands than for the old UFOMOD/B3 code. Variations in deposition velocities and the mixing height parameters play the most important role for uncertainties in the activity concentration values. (orig./HP).

3482 (LA-UR–89-3431) **The continuing saga of alpha CAM [continuous air monitor] development at Los Alamos.** Nelson, D.C.; Wolf, M.A.; McAtee, J.L. III. Los Alamos National Lab., NM (USA). [1989]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891087–9: IEEE nuclear science symposium and exhibits, San Francisco, CA (USA), 25-27 Oct 1989). Order Number DE90002382. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Monitoring requirements for airborne plutonium are becoming increasingly stringent as regulations require progressively lower limits of detection. The current requirement of 8 DAC-hours reflects the limitations of today's technology for workplace monitoring. Simultaneously, closed-ventilation systems and massive concrete buildings are concentrating radon and its daughter products. The daughter products produce a spectrum that degrades the ability of a continuous air monitor (CAM) to make accurate low-level determinations of plutonium. Los Alamos has been working on improved methods for detecting airborne alpha emitters in the presence of radon daughter products for the last 2 years. These efforts were recently coordinated into a program to examine all facets of CAM operation including aerosol collection, detection, signal processing, computation, alarming, communications, and finally, instrument cost. 4 refs., 2 figs.

3483 (ORNL/TM–11329) **ISIS: An Interactive System for Instruction and Sampling.** Buckley, B.B.; Fields, D.E. Oak Ridge National Lab., TN (USA). Nov 1989. 31p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90002507. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This computer interactive system for instruction and sampling is designed to introduce sampling of a contaminated site or field sampling to persons new to the activity. Through a series of questions, the program determines the extent of field sampling experience the novice has previously obtained. Based on answers given to these questions, the program provides the novice information about what should be done to prepare for and initiate correct field sampling procedures. Information on the types of radioactive emissions (alpha, beta, and gamma) for which the novice will be searching is also available. Detailed instructions are presented by the program for the detection and measurements of alpha, beta, and gamma radiation. Procedures for operating the alpha counter, Geiger-Mueller counter, and scintillation counter are presented in clear and precise steps so that very few errors, if any, are expected. 4 refs.

3484 (PB–89-205975/XAB) **Application of radon reduction methods (revised).** Mosley, R.B.; Henschel, D.B. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. Apr 1989. 111p. (EPA–625/5-88/024). Available from NTIS, PC A06/MF A01.

Also available from Supt. of Docs. See also PB–89-122162.

The purpose of the manual is to provide guidance in diagnosing radon problems in houses as well as in selecting, designing, and installing radon reduction systems. The organization of the manual is designed to guide the user through decision making by stages to the point of operating and maintaining a successful radon reduction system. Note that advice is provided on choosing a professional mitigator to recommend and/or install a mitigation system. The present document focuses on actions that can be taken to reduce the risks associated with indoor radon exposure once a problem has been recognized.

3485 (PB–89-219984/XAB) **Testing of indoor radon-reduction techniques in central Ohio houses: Phase 1 (Winter 1987-1988). Report for October 1987-August 1988 (Final).** Findlay, W.O.; Robertson, A.; Scott, A.G. Acres International Corp., Amherst, NY (USA). Jul 1989. 316p. Available from NTIS, PC A14/MF A01.

See also PB–87-188124.

The U.S. Environmental Protection Agency (EPA) has a program to demonstrate practical, cost-effective methods to reduce indoor radon concentrations in housing to 150 Bq/cu m (4 pCi/L) or less. The complete program will evaluate the full range of radon-reduction methods, i.e., house ventilation, sealing of entry routes, soil ventilation, radon removal from water, and air cleaning in the full range of housing substructure types and building styles, and geological conditions across the continental United States. The program described in the report demonstrated certain radon-reduction methods in housing and geology typical of southern Ohio in particular, and the central Great Plains States in general. The testing of radon-mitigation systems in Ohio houses is envisioned as taking place in two phases. The report describes Phase 1, which was carried out in 16 existing houses in the Dayton area during the 1987-1988 heating season.

3486 (PB–89-224000/XAB) **Environmental Radiation Data: Report 56, October-December 1988. Quarterly report.** Office of Radiation Programs, Washington, DC (USA). Jun 1989. 42p. (EPA–520/5-89/013). Available from NTIS, PC A03/MF A01.

See also PB–89-135958.

Environmental Radiation Data (ERD) contains data from the Environmental Radiation Ambients Monitoring System (ERAMS). Data from similar networks operated by contributing States, Canada, Mexico, and the Pan American Health Organization are reported in the ERD when available. The ERAMS is comprised of nationwide sampling stations that provide air, surface and drinking water and milk samples from which environmental radiation levels are derived. Sampling locations are selected to provide optimal population coverage while functioning to monitor fallout from nuclear devices and other forms of radioactive contamination of the environment. The radiation analyses performed on these samples include gross alpha and gross beta levels, gamma analyses for fission products, and specific analyses for uranium, plutonium, stronium, iodine, radium, krypton, and tritium.

3487 (PB–89-224273/XAB) **Indoor radon and radon-decay product measurement protocols.** Office of Radiation Programs, Washington, DC (USA). Mar 1989. 105p. (EPA–520/1-89/009). Available from NTIS, PC A06/MF A01.

See also PB–89-224265.

The publication updates the Interim EPA Radon Measurement Protocols by providing guidance for using a total of 11 measurement techniques. EPA has extensive laboratory and field experience with seven of the methods: continuous working level and radon monitors, alpha-track detectors, charcoal canisters, RPISUs, and grab techniques. The remaining four methods are interim; EPA has evaluated these techniques in the laboratory and found them to be satisfactory. The protocols provide instrument-specific technological guidance that can be used as the basis for standard operating procedures.

3488 (PNL-SA–17367) **Meteorological monitoring for environmental/dose assessment and emergency response modeling: How much is enough?.** Glantz, C.S. Pacific Northwest Lab., Richland, WA (USA). 1989. 10p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891053–9: 28. Hanford life sciences symposium on environmental monitoring, restoration and assessment: what have we learned?, Richland, WA (USA), 16-19 Oct 1989). Order Number DE90002726. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

In evaluation the effectiveness and appropriateness of meteorological monitoring programs, managers responsible for planning and operating emergency response or environmental/dose assessment systems must routinely question whether enough meteorological data are being obtained to adequately support system applications. There is no simple answer or cookbook procedure that can be followed in generating an appropriate answer to this question. The answer must be developed through detailed consideration of the intended applications for the data, the capabilities of the models that would use the data, pollutant release characteristics, terrain in the modeling region, the size of the modeling domain, and the distribution of human population in the modeling domain. It is recommended that manager consult meteorologists when assessing these factors; the meteorologist's detailed knowledge of, and experience in, studying atmospheric transport and diffusion should assist the manager in determining the appropriate level of meteorological monitoring. 1 ref.

3489 (UCRL–21212) **Impact of a simulated nuclear winter environment on growth development and productivity of potatoes, winter wheat, pines and soybeans.** Palta, J.P. Lawrence Livermore National Lab., CA (USA). [1988]. 52p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90001145. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Several recent studies predict strong land surface cooling and reduction in solar irradiance following nuclear explosions (Turco et al., 1983; Covey et al., 1984; Thompson et al., 1984). Although there is disagreement among scientists on the extent and the duration of temperature and irradiation decrease, there is a general agreement on the "nuclear winter" hypothesis following nuclear war (Covey, 1985). Agreements between the timing of excessive frost events and volcanic eruptions supports such nuclear winter scenarios (La Marche Jr. and Hirschboek, 1984). More recently Robock (1988) recorded a drop in surface temperatures following the entrapment of smoke from a forest fire in northern California. These measurements also support the nuclear winter hypothesis. The present study was conducted to investigate the impact of a simulated nuclear winter environment on productivity of four plant species. 20 refs., 21 figs., 10 tabs.

3490 **Atmospheric depositional characteristics of Beryllium 7 and Lead 210 along Southeastern Virginia coast.** Todd, J.F. (Department of Oceanography, Old Dominion University, Norfolk,

Virginia (US)); Wong, G.T.F.; Olsen, C.R.; Larsen, I.L. *Journal of Geophysical Research (USA)*, 94(D8): 11106-11116 (20 Aug 1989).

Atmospheric depositional fluxes of ^{7}Be and ^{210}Pb were measured simultaneously in wet-only and bulk deposition over a 29-month period (October 1982 through February 1985) in Norfolk, Virginia (36°53′N, 76°18′W). Total precipitation accumulation during 1983 and 1984 was 134 and 129 cm, respectively, slightly above the normal yearly accumulation. The volume-weighted average concentrations of ^{7}Be in bulk deposition for 1983 and 1984 were 90 and 100 dpm/L, while those for ^{210}Pb were 5.9 and 6.6 dpm/L, respectively. The annual depositional fluxes of ^{7}Be and ^{210}Pb in bulk deposition in 1983 and 1984 were 12.0 and 12.9 dpm/cm^2 (for ^{7}Be) and 0.79 and 0.85 dpm/cm^2 (for ^{210}Pb), respectively. There was a high degree of correlation between ^{7}Be and ^{210}Pb concentrations in wet-only deposition. This was not aniticipated, considering that the sources of these two radionuclides are different. These results suggest that ^{7}Be and ^{210}Pb cannot be used as two independent tracers for materials originating in the stratosphere versus those from the troposphere. Dry depositional fluxes for both radionuclides, estimated from differences in the wet-only and bulk fluxes, were calculated to be a maximum of 12 and 11% of the bulk ^{7}Be and ^{210}Pb fluxes, respectively. On an annual average the washout ratio for ^{7}Be in bulk deposition was 370, while that for ^{210}Pb was 215. The annual average total deposition velocities for ^{7}Be and ^{210}Pb were estimated to be 1.3 and 0.7 cm/s, respectively.

3491 (PB–89-225411/XAB) **BACT/LAER (Best Available Control Technology/Lowest Achievable Emission Rate) Clearinghouse: A compilation of control-technology determinations. Fourth supplement to 1985 edition. Summary tables and appendices A-H.** PEI Associates, Inc., Cincinnati, OH (USA). Jun 1989. 568p. Available from NTIS, PC A24/MF A01.

See also report dated Jul 88, PB–89-109060.

The Clean Air Act as amended in 1977 prescribes several technology-based limitations affecting new or modified air-pollution sources: (1) new source performances standards (NSPS); (2) best available control technology (BACT); and (3) lowest achievable emission rate (LAER). The basic purposes of the BACT/LAER Clearinghouse are to: (1) provide State and local air-pollution-control agencies with current information on case-by-case control technology determinations that are made nationwide and (2) promote communication, cooperation, and sharing of control-technology information among the permitting agencies. The information presented in the compilation was abstracted from preconstruction permits and submitted voluntarily by the State and local air-pollution-control agencies.

3492 (DOE/SR/14069–2) **Establishment of a viable population of red-cockaded woodpeckers at the Savannah River Site: Progress report, FY 1989.** Allen, D.H. Forest Service, Aiken, SC (USA). Southeastern Forest Experiment Station. 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AI09-85SR14069. Order Number DE90001936. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In 1985 the Southeastern Forest Experiment Station in cooperation with the Department of Energy (DOE), the Savannah River Forest Station (SRFS) and the Savannah River Ecology Laboratory (SREL) initiated a research/management program to restore a viable population of red-cockaded woodpeckers (RCW) to the Savannah River Site (SRS). The program has progresses in two phases. The first phase (1985-1987) focused on stabilizing the declining RCW population at SRS. The second phase (1988-present) has focused on facilitating population expansion. In 1989 we have focused our efforts on development of techniques for excavating new RCW cavities, identification of old-growth stands with the potential of providing new nesting habitat to support population expansion, continued flying squirrel control, continued translocations of RCW's as needed, and monitoring clan composition and reproduction.

3493 (INIS-mf–12013, pp. 162-163) **Geological interpretation of lead isotope ratios in ores from the Aegaean.** Chalkias, S. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Vavelidis, M.; Schmitt-Strecker, S.; Begemann, F. Max-Planck-Institut fuer Kernphsik, Heidelberg (Germany, F.R.). 1988. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1987.* Order Number DE90722124. Available from NTIS (US Sales Only), PC A10/MF A01.

Lead isotope analyses from ore deposits of the Aegaean region were carried out under archaeometallurgical aspects. They are of geological interest as well. The lead isotopes point to the crust as the source region of the ore forming solutions. The model ages scatter very largely from Precambrain to negative values, but they concentrate in the alpidic orogenetic period. (orig.).

3494 (CONF-8906242–1) **The Hazardous Materials Information Exchange: An electronic bulletin board for the emergency response community.** Seymour, D. Argonne National Lab., IL (USA). [1989]. 3p. Sponsored by U.S. Department of Transportation; U.S. Federal Emergency Management Agency. DOE Contract W-31109-ENG-38. From HAZMAT '89 international conference; Atlantic City, NJ (USA); 13-15 Jun 1989. Order Number DE90002844. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Hazardous Materials Information Exchange (HMIX) is an electronic bulletin board sponsored jointly by the Federal Emergency Management Agency (FEMA) and the Research and Special Programs Administration (RSPA) of the US Department of Transportation (DOT). Its purpose is to serve as an exchange system or "clearinghouse" to provide federal, state, local, and private-sector individuals with a means of sharing timely and valuable information on topics relating to hazardous materials emergencies. The HMIX offers emergency management personnel information on training, private-sector initiatives, conferences, literature, other databases, legislation, regulations, and field contacts experienced in planning, enforcement, response, and mitigation of hazardous materials incidents.

3495 (CONF-8906243–1) **Uncontrolled hazardous waste site cleanup programs in the US: An overview.** Chiu, Shen-yann; Tsai, S.Y. Argonne National Lab., IL (USA). [1989]. 15p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract W-31109-ENG-38. From Conference on industry and pollution prevention; Taipei (Taiwan); 15-16 Jun 1989. Order Number DE90002215. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Problems concerning environmental contamination resulting from releases of hazardous substances at uncontrolled hazardous waste sites have received widespread attention in the US since the early 1980s. Today, the Superfund program established under CERCLA and SARA is one of the most ambitious and expensive environmental efforts ever attempted in this nation. The US Environmental Protection Agency (US EPA) has already spent over $4 billion on the program, and is committed to spending an additional $6 billion over the next three years. It is estimated that the cost for cleaning up the contaminated sites in the US will be over $150 billion. The purpose of this paper is to present a general overview of the uncontrolled hazardous waste site remediation programs presently being conducted in the US. Remedial actions to be discussed involve assessment, characterization, and cleanup of contaminated sites. Remediation may involve efforts to clean up the soil, surface water,

groundwater, or some combination of those; techniques include stabilization, removal, treatment, and disposal of bulk wastes. Present regulatory frameworks, methods for prioritization of contaminated sites, procedures for remedial investigations, and decisions processes for selection of remedial technologies are outlined. Also presented are lessons learned and suggestions for applying US experience in Taiwan. 12 refs., 3 tabs.

3496 (CONF-8907103–12) **The Pacific Basin Consortium: A new device for problems without borders.** Drucker, H. Argonne National Lab., IL (USA). 1989. 3p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract W-31109-ENG-38. From Technology-based confidence building: energy and environment; Santa Fe, NM (USA); 9-14 Jul 1989. Order Number DE90002167. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Environmentally malignant chemicals have a way of crossing borders. Produced either as products (PCBs) or contaminants of industrially important chemicals (dioxin) or as the consequence of industrial activity (SO_x, NO_x), these agents travel as items of commerce, as hazardous wastes shipped from one nation to another, in the waters of international rivers, and in the atmosphere. The world invents some 1000 new chemicals every year, adding to the 60,000-70,000 agents currently in use, perhaps half of which either have not been examined relative to potential toxicity or are known to possess an environmental/health hazard. However, with these apparent risks come obvious benefits. Industrialization and the use of chemicals appear to be parallel functions. Agricultural efficiency seems to correlate with use of agricultural chemicals (fertilizers, herbicides, pesticides). The production, use, and transmission of cheap, efficient energy appears to depend upon the chemistries of combustible materials, insulators, conductors, light-weight plastics and alloys, all either producing or involving chemicals of environmental concern.

3497 (CONF-8911106–1) **The generation and control of hazardous waste in the Pacific Basin.** Cirillo, R.R. Argonne National Lab., IL (USA). [1989]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 3. national conference on the management of hazardous wastes; Melborune (Australia); 19-21 Nov 1989. Order Number DE90002273. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Areas in the basin and on the rim of the Pacific Ocean are experiencing a growing concern with the management of chemical hazardous waste. About 41% of the world's population lives in the Pacific basin. By very rough estimates, almost 272 million metric tons of hazardous waste are being generated every year in this region. The problem is not confined to the large industrialized economies of the region. All areas of the Pacific Basin, from the large industrial giants to the small Pacific islands have already experienced the effects of improper treatment and disposal of hazardous wastes. This paper presents the results of a review of the scope of the hazardous waste problem in the Pacific Basin, identifies issues common to the region, and describes research needs. A survey of hazardous waste generation, treatment and disposal practices, and regulations controlling hazardous waste is presented. The paper also describes the Pacific Basin Consortium for Hazardous Waste Research, an organization of research institutes from around the region that have chosen to work together to address the technical questions involved in hazardous waste management. 2 refs., 3 figs., 1 tab.

3498 (LBL–27226) **Soil water and vegetation management for cleanup of selenium contaminated soils: Progress report.** Lawrence Berkeley Lab., CA (USA). May 1989. 74p. Sponsored by U.S. Department of the Interior. DOE Contract AC03-76SF00098. Order Number DE90002602. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Over the past year scientists have initiatived a new effort aimed at developing a soil water and vegetation management plan for Kesterson Reservoir. The plan is intended to result in a gradual depletion of the inventory of soluble selenium at the Reservoir through a combination agriculturally oriented practices that enhance dissipation of selenium from near surface soils. Agriculturally oriented processes that will contribute to depletion include microbial volatilization from the soils, direct volatilization by living plants, decomposition and volatilization of selenium-bearing vegetation, harvest and removal of seleniferous vegetation, and leaching. The benefits of using this integrated approach are that (1) no single mechanism needs to be relied upon to detoxify the soils, (2) a stable plant community can be established during this period so that impacts to wildlife can be more easily evaluated and controlled, (3) cleanup and management of the site can be carried out in a cost-effective manner. The management plan is also intended to facilitate control over wildlife exposure to selenium contaminated biota by creating a well managed environment. The majority of research associated with this new effort is being carried out at a 200 m by 50 m test plot in Pond 7. A two-line irrigation system , providing local groundwater as an irrigation supply, has been installed. Through an intensive program of soil water sampling, soil gas sampling, vegetation sampling, groundwater monitoring, and soil moisture monitoring, the mass balance for selenium under irrigated conditions is being evaluated. These studies, in conjunction with supplementary laboratory experiments will provide the information needed to develop an optimal management plan for the site. 23 refs., 38 figs., 10 tabs.

3499 (ORNL/FTR–3455) **[Ecosystem research on Walker Branch watershed]: Foreign trip report, October 22–28, 1989.** Elwood, J.W. Oak Ridge National Lab., TN (USA). 8 Nov 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002965. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The symposium and workshop on "Concepts in Ecosystem Research" was organized to bring together scientists and representatives from government ministries involved in funding environmental research in the FRG to discuss concepts in ecosystem research and to hear about a major ecosystem research project in the Bornhoved Lake District located near Kiel. The traveler presented a paper entitled "Ecosystem Research on Walker Branch Watershed," which is funded by the US Department of Energy's Office of Health and Environmental Research. The traveler also visited the Bornhoved Lake District, which is the site of a major new ecosystem research study involving forest, agricultural, and lake ecosystems. In addition, the traveler discussed approaches to organizing and managing a large interdisciplinary ecosystem research project with members of the steering committee for the Bornhoved Lake District project.

3500 (PB–89-229538/XAB) **Superfund Record of Decision (EPA Region 7): Findett, MO. (First Remedial Action), December 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 28 Dec 1988. 43p. (EPA/ROD/R–07-89/023). Available from NTIS, PC A03/MF A01.

Portions of this document are not fully legible.

The Findett/Hayford Bridge Road Ground Water site is located just north of the City of St. Charles, in St. Charles County, east-central Missouri. Land use in the site vicinity is primarily agricultural, but also includes a small industrial park containing Findett Corporation, Cadmus Corporation, and several other commercial and light industrial establishments. Until 1980, Findett Corporation reclaimed heat-transfer fluids or oils, some of which contained PCBs, and received waste solvents for reclamation or recycling. Subsequently, Findett has custom blended or manufactured organic chemicals for other companies. There is PCB-contaminated soil at the Findett facility as well as the adjacent Cadmus Corporation facility. The Elm Point Well Field is also at risk of contamination by releases from the site. The primary contaminants of concern affecting the soil and ground water are VOCs, and other organics including PCBs. The selected remedial action for the site includes onsite ground-water pumping and treatment using air stripping with discharge to the publicly owned treatment works; and excavation of contaminated soil with either offsite disposal or treatment.

3501 (PNL-SA–16809) **Regulatory requirements for groundwater monitoring networks at hazardous waste sites.** Keller, J.F. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 10p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891053–10: 28. Hanford life sciences symposium on environmental monitoring, restoration and assessment: what have we learned?, Richland, WA (USA), 16-19 Oct 1989). Order Number DE90002728. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In the absence of an explicit national mandate to protect groundwater quality, operators of active and inactive hazardous waste sites must use a number of statutes and regulations as guidance for

detecting, correcting, and preventing groundwater contamination. The objective of this paper is to provide a framework of the technical and regulatory considerations that are important to the development of groundwater monitoring programs at hazardous waste sites. The technical site-specific needs and regulatory considerations, including existing groundwater standards and classifications, will be presented. 14 refs., 2 tabs.

5103 Radioactive Materials Monitoring and Transport

Refer also to citation(s) 2183, 2193, 2229, 2232, 2241, 2688, 3483, 3486, 3568, 3751

3502 (BMU–1988-196) **Ingestion of radiocesium and strontium-90 by self-suppliers and non-self-suppliers in the first year following the Chernobyl reactor accident. Data taken as a basis for derivation of secondary intervention reference levels.** Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten. Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene. 1988. 99p. (In German). Contract BMU St.Sch. 01038. Available from Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

In Southeast Bavaria, the region of Germany with the highest cesium (Cs) deposition, 20 self and non-self-suppliers were selected for observation of the ingestion and incorporation of radiocesium by means of check measurements of radioactivity in prepared diet duplicates and in the whole body. The results are comparatively analyzed. Surveys conducted in February/March 1987 show that both populations differ significantly in Cs incorporation. Children and adults among the self-suppliers revealed a Cs incorporation 3.5 times higher than that of the non-self-suppliers. An average Cs concentration of 8900 Bq was measured among the adult self-suppliers. By comparison, the average Cs concentration among the adult non-self-suppliers was only 2310 Bq. In the same period, a supply rate of 110 Bq/d (45-216 Bq/d) was measured among the adult self-suppliers, and a supply rate of 17 Bq/d (10-27 Bq/d) among the adult non-self-suppliers. The amount of activity incorporated per day was 77 Bq/d (64-96 Bq/d) among the younger children of the self-suppliers, and 32 Bq/d (24-40 Bq/d) among the older children of the non-self-suppliers. The specific activity of strontium 90 in dairy, meat and vegetable products mainly from the self-sufficiency areas was also analyzed. The average concentration of the activity of strontium 90 in raw milk was 0.4 Bq/l in February/March 1987, and the average specific activity for the other food products was 0.25-3 Bq/kg. The average values for the ingestion of strontium 90 over all the food products lie approximately between 0.3-0.5 Bq per person and day, and are comparable with the value of 0.3 Bq in the period before the reactor accident in Chernobyl. Starting from these values, the relative contamination of food as well as the effective dose equivalent of both groups of suppliers for the first year after the reactor accident in Chernobyl was measured. (orig./MG).

3503 (HW–33128) **Radiological Sciences Department annual report, research and development, fiscal year 1954.** Hanford Works, Richland, WA (USA). 15 Sep 1954. 29p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE90002518. Available from NTIS, PC A03/MF A01 - OSTI.

The following material is a progress report of work performed in Radiological Sciences Research and Development during FY 1954. The report, primarily non-technical in nature, presents a summary of accomplishments achieved over the twelve-month period for each of the three programs: Biology, Biophysics and Radiological Engineering. A tabulation of manpower and costs associated with these activities is included.

3504 (HW–39558) **Radiological Sciences Department Annual report: Research and development, Fiscal year 1955.** Mickelson, M.L.; Kornberg, H.A.; Pearce, D.W.; Smith, J.M. General Electric Co., Richland, WA (USA). Hanford Atomic Products Operation. 23 Sep 1955. 35p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE90002521. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Declassified 15 May 1973.

The following material comprises a summary of work performed in Radiological Sciences Research and Development during FY 1955. The report, primarily non-technical in nature, presents accomplishments achieved over the twelve-month period in each of the three sections conducting research and development work: Biology, Biophysics, and Radiological Engineering. A tabulation of manpower and costs associated with these activities is included. 2 tabs.

3505 (INIS-mf–11557) **U, Th and K distributions inferred from regional geology and the terrestrial radiation profiles in India.** Sankaran, A.V.; Jayaswal, B.; Nambi, K.S.V.; Sunta, C.M. Bhabha Atomic Research Centre, Bombay (India). 1986. 104p. Order Number DE90608113. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

The natural background radiation or natural radioactivity in environment in any region is mainly due to gamma radiation emanating from uranium, thorium and potassium contents of the ground matter of that region. Instead of carrying out accurate but tedious radiometric surveys at site, a fair estimate of the radiation value of any place can be calculated by knowing different types of rocks exposed at that place and the geochemical distribution of radioelements in those exposed rocks. The geochemical distribution in the exposed rocks can be computed by using worldwide average values of U, Th and K for various kinds of crystal rocks. These average values are obtained from the published geochemical data for different rock types from all over the world. Using this method, the geochemical distributions of U, Th and K are inferred for different states of India and the terrestrial radiation profiles in India are prepared. For this work, the geologic information data contained in the maps and publications of the Geological Survey of India were used. Annual radiation levels are expressed in microgray per year (μGy/y) using conversion factors recommended by UNSCEAR (1982). These represent the absorbed dose levels in air at 1 meter above the earth's surface and take into account the skyshine effect from the earth as an infinite radioactive source. Contributions from cosmic rays are not included in these estimates. Multicolour and monotone (black) maps depicting the fluctuating profile of radiation across the individual States of India and the country as a whole are given. Also the details of the radiation contribution of different stratigraphic horizon of each State in the country have been tabulated. It is observed that 1 per cent of the sub-continent shows radiation levels greater than 2000 μGy/y. (M.G.B.). 91 refs., 25 tabs., 35 fi gs.

3506 (Juel–2250) **Investigation of the transfer of ^{90}Sr, ^{137}Cs, ^{60}Co, and ^{54}Mn from soil to plant, and of the main soil parameters that have influence on the transfer process. Final report.** Steffens, W.; Fuehr, F.; Mittelstaedt, W.; Klaes, J.; Foerstel, H. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Radioagronomie; Bundesministerium des Innern, Bonn (Germany, F.R.). Dec 1988. 123p. (In German). Contract BMI St.Sch. 702a. Order Number DE90721871. Available from NTIS (US Sales Only), PC A06/MF A01.

In lysimetric field experiments with 2 soil types most common in the Federal Republic of Germany the effects of a continuous contamination as well as of a temporary contamination of the soil caused by a possible accident were simulated to allow forecastings on the resorption of radionuclides by farm plants. Parallel pot experiments (8 kg of soil) in greenhouses and in the field and small pot experiments under reproducible climatic chamber conditions were to examine wether or not transfer data from laboratory and pot experiments can be applied to field conditions. In addition to this, soil types representative according to soil mapping were taken from the locations of the nuclear power plants Biblis and Stade, and their properties were determined. In large-scale comparative pot experiments the relative transfer factors were determined. (orig./DG).

3507 (NIR–1/88) **HTO deposition through gas exchange between soil and atmosphere.** Feinhals, J. Niedersaechsisches Inst. fuer Radiooekologie (Germany, F.R.); Hannover Univ. (Germany, F.R.). Fachbereich Physik. Jun 1988. 137p. (In German). Order Number DE90721890. Available from NTIS (US Sales Only), PC A07/MF A01.

Theoretical considerations show that the ratio of HTO/H_2O molecules, i.e. the specific activity, is not the same in atmospheric humidity and moisture absorption but differs by the so-called specific activity coefficient k. On this basis a computer model (ATHOS) was developed which allowed the calculation of both the surface contamination of the soil due to the gas exchange with a contaminated atmosphere and the depth-specific distribution of the soil acitvity. On the one hand the equations base on a modified Philip-de Vries theory, and on the other hand on a large number of soil column experiments which served the examination of the influence of parameters of microclimate and soil physics on the absorption and diffusion of tritiated water vapour under simulated conditions Above all the individual capability of each soil type to absorb moisture must be taken into consideration in connection with the HTO transfer. In this context theoretical and experimental examinations were carried out indicating a practice-related possibility to determine the soil-specific absorption capability. (orig./DG).

3508 (ORNL/RASA–87/36) **Results of the radiological survey at 9 Hancock Street, Lodi, New Jersey (LJ028).** Cottrell, W.D.; Floyd, L.M.; Francis, M.W.; Mynatt, J.O. Oak Ridge National Lab., TN (USA). Sep 1989. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90002919. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New Jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1916 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. Area residents used the sandlike waste from this thorium extraction process mixed with tea and cocoa leaves as mulch in their yards. Some of these contaminated wastes were also eroded from the site into Lodi Brook. At the request of the US Department of Energy (DOE), a group from Oak Ridge National Laboratory conducts investigative radiological surveys of properties in the vicinity of MCW to determine whether a property is contaminated with radioactive residues, principally ^{232}Th, derived from the MCW site. The survey typically includes direct measurement of gamma radiation levels and soil sampling for radionuclide analyses. The survey of this site, 9 Hancock Street, Lodi, New Jersey (LJ028), was conducted during 1985 and 1986. Some radionuclide measurements were greater than typical background levels in the northern New Jersey area. However, results of the survey demonstrated no radionuclide concentrations in excess of the DOE Formerly Utilized Sites Remedial Action Program criteria. 5 refs., 6 figs., 3 tabs.

3509 (ORNL/RASA–88/18) **Results of the radiological survey at 72 Sidney Stret, Lodi, New Jersey (LJ067).** Foley, R.D.; Carrier, R.F.; Floyd, L.M.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Sep 1989. 24p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90001279. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1916 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. Area residues used the sandlike waste from this thorium extraction process mixed with tea and cocoa leaves as mulch in their yards. Some of these contaminated wastes were also eroded from the site into Lodi Brook. At the request of the US Department of Energy (DOE), a group from Oak Ridge National Laboratory conducts investigative radiological surveys of properties in the vicinity of MCW to determine whether a property is contaminated with radioactive residues, principally ^{232}Th, derived from the MCW site. The survey typically includes direct measurement of gamma radiation levels and soil sampling for radionuclide analyses. The survey of this site, 72 Sidney Street, Lodi, New Jersey (LJ067), was conducted during 1987. Results indicated concentrations of ^{232}Th slightly in excess of the DOE remedial action criterion for subsurface soil. This finding, coupled with the fact that adjacent properties have been designated by DOE for remedial action, and that the old Lodi Brook streambed is apparently beneath the property, suggests that it be considered for inclusion in the DOE remedial action program. 4 refs., 5 figs., 3 tabs.

3510 (ORNL/RASA–88/30) **Results of the radiological survey at 133 Maywood Avenue, Maywood, New Jersey (MJ025).** Foley, R.D.; Carrier, R.F.; Floyd, L.M.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Oct 1989. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90001278. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New Jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1916 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. The survey typically includes direct measurement of gamma radiation levels and soil sampling for radionuclide analyses. The survey of this site, 133 Maywood Avenue, Maywood, New Jersey (MJ025), was conducted during 1987. The survey results demonstrate that all radionuclide concentrations and measurements conform to DOE remedial action criteria. All values are at or below typical background values found in northern New Jersey. 5 refs., 2 figs., 3 tabs.

3511 (ORNL/RASA–89/5) **Results of the independent verification of radiological remedial action at 381 East 3rd South Street, Monticello, Utah (MS00140).** Crutcher, J.W.; Smuin, M.W. Oak Ridge National Lab., TN (USA). Oct 1989. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90003279. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In 1980 the site of a vanadium and uranium mill at Monticello, Utah, was accepted into the US Department of Energy (DOE's) Surplus Facilities Management Program, with the objectives of restoring the government-owned mill site to safe levels of radioactivity, disposing of or containing the tailings in an environmentally safe manner, and performing remedial actions on off-site (vicinity) properties that had been contaminated by radioactive material resulting from mill operations. During 1986, UNC Geotech, the remedial action contractor designated by DOE, performed remedial action on the vicinity at 381 East 3rd South Street, Monticello, Utah. The Pollutant Assessments group (PAG) of Oak Ridge National Laboratory was assigned the responsibility of verifying the data supporting the adequacy of remedial action and confirming the site's compliance with DOE guidelines. The PAG found that the site successfully meets the DOE remedial action objectives. Procedures used by PAG are described. 3 refs., 2 tabs.

3512 (ORNL/RASA–89/7) **Results of the independent verification of radiological remedial action at 98 East 5th South Street, Monticello, Utah (MS00076).** Crutcher, J.W.; Smuin, M.W. Oak Ridge National Lab., TN (USA). Oct 1989. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90003278. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In 1980 the site of a vanadium and uranium mill at Monticello, Utah, was accepted into the US Department of Energy's (DOE's) Surplus Facilities Management program with the objectives of restoring the government-owned mill site to safe levels of radioactivity, disposing of or containing the tailings in an environmentally safe manner, and performing remedial actions on off-site (vicinity) properties that had been contaminated by radioactive material resulting from mill operations. During 1984, UNC Geotech, the remedial action contractor designated by DOE, performed remedial action on the vicinity property at 98 East 5th South Street, Monticello, Utah. The Pollutant Assessments Group (PAG) of Oak Ridge National

Laboratory was assigned the responsibility of verifying the data supporting the adequacy of remedial action and confirming the site's compliance with DOE guidelines. The PAG found that the site successfully meets the DOE remedial action objectives. Procedures used by PAG are described. 3 refs., 2 tabs.

3513 (ORNL/RASA–89/8) **Results of the independent verification of radiological remedial action at 196 East 3rd South Street, Monticello, Utah (MS00083).** Crutcher, J.W.; Smuin, M.W. Oak Ridge National Lab., TN (USA). Oct 1989. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90003281. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

3515 (PNL-SA–16766) **Strontium-90 in Canada goose eggshells: Non-fatal monitoring for contamination in wildlife.** Rickard, W.H.; Eberhardt, L.E. Pacific Northwest Lab., Richland, WA (USA). Aug 1989. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-891053–3: 28. Hanford life sciences symposium on environmental monitoring, restoration and assessment: what have we learned?, Richland, WA (USA), 16-19 Oct 1989). Order Number DE90001893. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Strontium-90 as measured in eggshells taken form newly hatched eggs in 42 Canada goose nests. Higher-than-background levels were present in eggshells from only a few nests. The origin of the enhanced strontium-90 levels appears to be Hanford Site facilities. However, the amounts measured are too low to expect to see any deleterious health or reproductive effects on the goose population. Eggshells provide an efficient way to obtain biological samples for environmental monitoring without inducing goose mortality. 10 refs., 2 figs.

3516 (UCRL–100936) **More about breathing on the Mesa.** Woodward, E.C. Lawrence Livermore National Lab., CA (USA). Sep 1989. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8909163–6: 5. symposium on containment of underground nuclear detonations, Santa Barbara, CA (USA), 19-21 Sep 1989). Order Number DE90002973. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Atmospheric pressure cycling ("breathing") has assisted diffusion in enabling gaseous radioactive fission debris to reach the surface, as detected by noble gas samplers, after a number of Pahute Mesa events. More and updated information on the geology and location of the "breathing" phenomenon may better define its likelihood of occurrence. 1 fig., 1 tab.

3517 (PNL–6982) **Summary of commercial conservation programs environmental issues and program consistency.** Beachler, M.C. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 93p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC06-76RL01830. Order Number DE90002737. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Pacific Northwest Laboratory (PNL) conducted this study for the Office of Energy Resources of the Bonneville Power Administration. The purpose of the report is to compare and contrast the environmental requirements and issues involving Bonneville's residential conservation programs. In addition to environmental issues that Bonneville has addressed in environmental documents, this report also briefly examines new issues that may affect residential conservation programs. The key environmental concern confronting each of the programs with measures aimed at reducing air leakage in houses (both new and existing) is indoor air quality. There are inconsistencies in how the Weatherization Program and the New Homes programs approach indoor air quality. However, these differences make sense, given the character and constraints affecting how each program operates. Newer issues that have arisen include global warming, potential health effects of mineral and glass fibers, and possible fire hazards associated with plastic foam and cellulose insulation. Bonneville staff are aware of these issues as they relate to conservation programs. No action appears necessary at this time.

3521 (PB–89-224950/XAB) **Bench-scale fixation of soils from the Tacoma Tar Pits Superfund Site. Final report.** Rupp, G. Nevada Univ., Las Vegas, NV (USA). Environmental Research Center. Jul 1989. 106p. Available from NTIS, PC A06/MF A01.

This report documents the result of a bench-scale soil-fixation study conducted with materials from the Tacoma Tar Pits Superfund Site. Chemical fixation (also called stabilization/solidification) is a relatively new technique for remediating contaminated soils. It entails both immobilization of contaminants via sorption or chemical reaction and physical transformation of the soil into a firm, impervious 'monolith.' Fixation has been used for years to immobilize metals in low-level radioactive wastes and specialized industrial wastes, such as baghouse dusts. It has not been commonly used at sites with organic contamination, however. The study utilized materials contaminated with metals and several types of organic contaminants including benzene, toluene, xylene, polycyclic aromatic hydrocarbons, and polychlorinated biphenyls. Samples of heavily contaminated soils and wastes from the site were chemically fixed using a proprietary product, and the resulting monoliths were subjected to various physical, chemical, and leaching tests. The purpose was to assess the efficacy of fixation for a complicated matrix, i.e., one that was physically heterogeneous and contained several classes of contaminants.

3522 (PB–89-225494/XAB) **Superfund Record of Decision (EPA Region 5): Belvidere Landfill, IL. (First Remedial Action), June 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Jun 1988. 70p. (EPA/ROD/R–05-88/069). Available from NTIS, PC A04/MF A01.

The Belvidere Landfill, is located just outside the City of Belvidere, County of Boone, Illinois. The City of Belvidere owned the landfill from 1939 to 1973, operating first as a municipal landfill until 1965 and then as an industrial landfill until 1973. The primary contaminants of concern affecting the soil and ground water include: organics, PCBs, PAHs, metals, and lead. The selected remedial action for the site includes: RCRA Subtitle C capping over the 19.3-acre landfill; treatment or containment of soil from the drum-disposal area following resampling to determine the magnitude of PCB contamination; ground water pump and treatment possibly using air stripping with discharge to either the Kishwaukee River or the city treatment plant; ground-water monitoring; pond- and river-fish monitoring; installation of an upgraded fence; deed restrictions to control unacceptable onsite activities and construction; and flood control measures to prevent erosion of the cap and landfill contents.

3523 (PB–89-225510/XAB) **Superfund Record of Decision (EPA Region 5): Poer Farm, IN. (First Remedial Action), September 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1988. 29p. (EPA/ROD/R–05-88/079). Available from NTIS, PC A03/MF A01.

The 4.5-acre Poer Farm site is located about 4 miles north of Charlottesville, in Hancock County, Indiana. The site is an abandoned tract of land with a collapsed house and barn and an old, inactive well that lies southeast of the house. The surrounding area is open farmland. The nearest house is about 0.25 mile from the site and the nearby residents rely on private wells for their water supply. There are about 270 homes with a population of about 2,400 within 3 miles of the site. In 1973, approximately 260 drums of offgrade solvents and paint resins were stockpiled on the Poer property. In 1981 and 1983, the drums and an onsite well were tested and found to contain elevated levels of arsenic, cadmium, lead, and mercury. Emergency cleanup activities were conducted in the summer of 1983. All wastes were removed from the site and six to eight inches of soil were removed from the drum storage areas. Subsequent sampling showed significantly decreased levels of the heavy metals. The site was fenced and warning signs were posted. An investigation in 1988 indicated that contaminant levels were below Federal and State Health Standards and that there was no threat to human health or the environment.

3524 (PB–89-225528/XAB) **Superfund Record of Decision (EPA Region 6): South Valley/Edmunds Street, NM. (Second Remedial Action), June 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 28 Jun 1988. 47p. (EPA/ROD/R–06-88/037). Available from NTIS, PC A03/MF A01.

Portions of this document are not fully legible.

The South Valley/Edmunds Street site is a large area in Albuquerque, New Mexico, surrounding the municipal water well known as San Jose 6. Within this large area are a number of industrial properties owned and operated by different groups and individuals. Analyses of the area have shown significant levels of industrial solvents in the soil, and a plume of contaminated ground water starting at the drainage pit area and extending to the east. The contaminated ground water currently poses a direct threat to Albuqerque's water supply by moving toward the city's well fields. The primary contaminants of concern affecting the ground water include VOCs such as PCE and TCE. The selected remedial action for the site includes: ground water pump and treatment using air stripping (packed-tower aeration) with reinjection of the treated water into the aquifer through infiltration galleries; and ground water and air monitoring.

3525 (PB–89-225536/XAB) **Superfund Record of Decision (EPA Region 3): Tyson's Dump Site, PA. (Second Remedial Action), September 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Sep 1988. 81p. (EPA/ROD/R–03-88/068). Available from NTIS, PC A05/MF A01.

See also PB–85-213858. Portions of this document are not fully legible.

The Tyson's Dump site is an abandoned septic and chemical waste-disposal facility on a four-acre plot bordered on the east and west by unnamed tributaries of the Schuylkill River. During its period of operation from 1962 to 1970, several formerly unlined lagoons were used to dispose of various industrial, municipal and chemical wastes. Spills and overflows reportedly occurred, dispensing contaminants throughout the site. Surface-water runoff and seeps contributed to offsite migration of wastes toward the Schuylkill River. In 1973 the State ordered the original onsite disposal facility closed. The primary contaminants of concern affecting the ground water are VOCs including 1,2,3-trichloropropane, total xylenes, toluene, and other organics. The selected remedial action for the site includes pumping and treatment of contaminated ground water with discharge of treated water to the river; offsite incineration of organic-phase condensate produced from steam regeneration of vapor-phase carbon beds; and ground-water monitoring.

3526 (PB–89-225544/XAB) **Superfund Record of Decision (EPA Region 10): Commencement Bay/Near Shore, WA. (First Remedial Action), December 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Dec 1987. 107p. (EPA/ROD/R–10-88/011). Available from NTIS, PC A06/MF A01.

Portions on this report are not fully legible. See also PB–85-214179.

The Tacoma Tar Pits site covers approximately 30 acres within the Commencement Bay-Nearshore/Tideflats site in Tacoma, Pierce County, Washington. Currently, there is concern for the site's impact on surface-water quality; many local industries use ground water from onsite wells. The primary contaminants of concern affecting

surface water and soil include: benzene, PAHs, PCBs, and lead. The selected remedial action for the site includes: excavation of all contaminated soils exceeding 1% total PAHs and all surface soils exceeding a 10^{-6} lifetime cancer risk level with stabilization of all excavated soils in a polymer/cement mixture; capping of the stabilized matrix with asphalt; channeling and managing of surface waters; ground-water monitoring; and removal and treatment of ponded water.

3527 (PB–89-225577/XAB) **Superfund Record of Decision (EPA Region 1): Cannon Engineering, MA. (First Remedial Action), March 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 31 Mar 1988. 228p. (EPA/ROD/R–01-88/031). Available from NTIS, PC A11/MF A01.

Portions of this document are not fully legible.

The Cannon Engineering Corporation (CEC) facility is located in a small industrial park in the western part of the Town of Bridgewater, Plymouth County, Massachusetts. CEC, which has owned the property since 1974, handled, stored, and incinerated chemical waste onsite from 1974 to 1980. EPA conducted site investigations between 1980 and 1982, and in October 1982, Massachusetts contracted for the removal of sludge and liquid waste from onsite tanks and drums. In January 1988, EPA provided for the removal and disposal of numerous hazardous materials abandoned at the site. This remedial action addresses three discrete areas of soil and sediment contamination. The primary contaminants of concern affecting the ground water, soil, and debris are VOCs including benzene, TCE, and vinyl chloride, and other organics including PCBs and PAHs. The selected remedial action includes: excavation and onsite treatment of VOC-contaminated soil by thermal aeration, and excavation and offsite treatment of PCB-contaminated soil by incineration; decontamination, removal, and disposal of contaminated buildings, tanks, and structures; additional soil sampling; ground water monitoring.

3528 (PB–89-225908/XAB) **Superfund Record of Decision (EPA Region 5): Summit National Site, Deerfield, OH. June 1988. First Remedial Action. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. Jun 1988. 157p. (EPA/ROD/R–05-88/068). Available from NTIS, PC A08/MF A01.

Portions of this document are not fully legible.

The 11.5-acre Summit National site is a former coal strip mine approximately 45 miles southeast of Cleveland. Summit National Liquid Services operated a solvent-recycling and waste-disposal facility on the site from 1973 to 1978. Solvents, paint sludges, phenols, cyanide, arsenic, and other liquid wastes were stored, incinerated, and buried or dumped during site operations. All onsite media are contaminated with a variety of organic and inorganic compounds, and investigations indicate that offsite areas also are affected. The primary contaminants of concern affecting soil, sediments, ground water, and surface water are VOCs including benzene, toluene, TCE and xylenes, other organics including phenols, PAHs and PCBs, and metals including arsenic and chromium. The selected remedial action for the site includes: excavation and onsite incineration of contaminated soil and sediments and the contents of approximately 1,600 buried drums and 4 tanks, with disposal of incinerator residuals in an onsite RCRA landfill; groundwater pump and treatment and onsite surface-water treatment and discharge of treated water to downgradient surface water; dismantling and onsite disposal of all onsite structures; ground-water and surface water monitoring; and residence relocation.

3529 (PB–89-229504/XAB) **Superfund Record of Decision (EPA Region 8): Libby Ground Water Contamination, MT. (Second Remedial Action), December 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Dec 1988. 132p. (EPA/ROD/R–08-89/022). Available from NTIS, PC A07/MF A01.

See also PB–87-189874. Portions of this document are not fully legible.

The Libby Ground Water Contamination site (also known as the Champion Mill site or the Libby Pesticide site) is located on the Champion International Corporation lumber and plywood mill in the City of Libby, Lincoln County, Montana. The contaminated soil/source area is within the confines of the facility; however, groundwater contamination extends well into the City of Libby. Wood-treating fluids and their constituents, including creosote and PCP, are the contaminants of concern at the site. They are found in soil and sediments at several different locations, including former waste pits, tank storage areas, and butt dip and treatment sites. The contamination is the result of spent fluids, overflow of treatment tanks, and spills. In addition to creosote and PCP, certain carrier fuels or oils were used at the site and contributed VOC contaminants. The site has been divided into three operable units; however, they require concurrent remediation. The primary contaminants of concern affecting the soil, sediments, and ground water at the site are VOCs including benzene; other organics including dioxin, PAHs (creosote constituents), and PCP; metals including arsenic; and oil.

3530 (PB–89-229546/XAB) **Superfund Record of Decision (EPA Region 2): Ciba-Geigy, NJ. (First Remedial Action), April 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 24 Apr 1989. 123p. (EPA/ROD/R–02-89/076). Available from NTIS, PC A06/MF A01.

Portions of this document are not fully legible.

The Ciba-Geigy Chemical Corporation site is located in Dover Township, Ocean County, New Jersey. From 1952 to 1988, a variety of synthetic organic pigments, organic dyestuffs and intermediates, and epoxy resins were manufactured at the site. The company disposed of chemical wastes onsite in several locations. The drum-disposal area and lime-sludge-disposal area were closed and capped in 1978. About this time, the filtercake disposal area was also closed and covered with soil. Ground-water contamination is migrating from these inactive disposal sites easterly towards the Toms River. Contaminants are present in leaking drums, waste sludges, soils, and ground water. The primary contaminants of concern affecting the ground water are VOCs including benzene, PCE, TCE, and toluene; and metals including arsenic and chromium. The selected remedial action for the site includes sealing contaminated residential irrigation wells; on- and off-site ground-water pumping with onsite treatment followed by temporarily retaining the ground water in basins for monitoring and subsequent discharge to the Toms River; and implementation of a river- and ground-water monitoring program.

3531 (PB–89-229553/XAB) **Superfund Record of Decision (EPA Region 7): Todtz, Lawrence Farm, IA. (First Remedial Action), November 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 4 Nov 1988. 59p. (EPA/ROD/R–07-89/022). Available from NTIS, PC A04/MF A01.

Portions of this document are not fully legible.

The 2.7-acre Dupont Impoundment of the Todtz Farm site is located on a 120-acre farm 1.25 miles west of Camanche, Iowa. Originally a sand and gravel mine, the landfill received municipal waste from 1969 to 1975. Dupont disposed of an estimated 4,300 tons of wet end cellophane process wastes from 1971 until its closure in 1975. Impoundment wastes are periodically in direct contact with the ground water beneath the site, which flows southeasterly toward the Mississippi River. Domestic wells and the municipal water-supply wells for Camanche located downgradient of the site may be affected by contamination from the site. In addition, several ponds and lakes in the vicinity are potential receptors for contaminated runoff and recharge. The primary contaminants of concern affecting the ground water are VOCs including toluene and benzene, and metals including arsenic, lead, and chromium. The selected remedial action for the site includes installation of a soil cover over the Dupont Impoundment; implementation of institutional controls including deed and land-use restrictions; provision of an alternate water supply for an affected residence by relocating an existing well; and ground-water monitoring.

3532 (PB–89-229561/XAB) **Superfund Record of Decision (EPA Region 6): Pesses Chemical, TX. (First Remedial Action), December 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 22 Dec 1988. 47p. (EPA/ROD/R–06-89/047). Available from NTIS, PC A03/MF A01.

The 4.2-acre Pesses Chemical Company site is located in Tarrant County, Ft. Worth, Texas. The site is in a light industrial and commercial area with an estimated 19,500 people residing or working within a one-mile radius. In June 1979, the Pesses Company began operations to reclaim cadmium and nickel from dry-cell batteries and metal sludges. In January 1981, site operations were discontinued. Heavy metals contamination from airborne dust and surface-water runoff are the main potential threats at the site. The primary contaminants of concern affecting the soil, buildings and equipment, and debris are metals including cadmium, lead, and nickel. The selected remedial action for the site includes excavation of contaminated offsite soil and wastes, and consolidation with onsite contaminated soil, followed by in-situ stablization; decontamination of the metal warehouse and equipment with resultant solid wastes combined with the soil remediation, and waters treated and discharged into the sewer system; offsite disposal of drums and debris, as well as equipment that cannot be adequately cleaned, and offsite deep-well injection of waste water above POTW discharge requirements; and cleaning and sealing the sumps.

3533 (PB–89-229579/XAB) **Superfund Record of Decision (EPA Region 4): American Creosote Works, TN. (First Remedial Action), December 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 5 Jan 1989. 38p. (EPA/ROD/R–04-89/043). Available from NTIS, PC A03/MF A01.

Portions of this document are not fully legible.

The American Creosote Works (ACW) site is located immediately southwest of Jackson, in central Madison County, Tennessee. ACW conducted wood-preserving operations using both creosote and PCP from the early 1930s until December 1981. Untreated process waste water and potential contaminated storm water runoff were discharged directly into Central Creek until 1973, at which time a levee was constructed to retain surface water runoff. The soil borrow pits used for the levee construction became sludge storage lagoons. A waste water treatment system was installed onsite during 1974 and 1975 and operated until 1981. The selected remedial action for the site includes consolidation and incineration of sludges in the vicinity of the buildings and tanks; on- or offsite incineration of the oils and sludges from the tanks; treatment of tanked process liquids onsite using a sand filter, filter press, and carbon adsorption unit, followed by discharge to a surface stream; decontamination and offsite disposal of site structures; construction of a flood-protection dike; deed restrictions and site fencing; and site stabilization including monitoring onsite water levels behind the dikes and pumping, treating (as needed), and discharging impounded water pending a final remedy.

3534 (PB–89-229587/XAB) **Superfund Record of Decision (EPA Region 3): M. W. /Manufacturing, PA. (First Remedial Action), March 1989.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 31 Mar 1989. 51p. (EPA/ROD/R–03-89/067). Available from NTIS, PC A04/MF A01.

Portions of this document are not fully legible.

The M.W. Manufacturing site is a former copper recovery facility located in Montour County, Pennsylvania, two miles north of Danville. M.W. Manufacturing was engaged in secondary copper recovery from scrap wire, using both mechanical and chemical processes. Granular carbon wastes generated by the chemical process was dumped onsite, and spent solvents and acids were allegedly disposed of onsite. The initial remedial investigation revealed several areas posing potential threats to public health: the carbon waste pile, four wire-fluff waste piles, a surface impoundment, buried lagoon and contaminated soils, drums and storage tanks. The remedial action addresses the concerns for direct contact with and migration to ground water of contaminants from the carbon waste pile. The primary contaminants of concern affecting the soil are VOCs including PCE and TCE; organics including PCBs; and metals including lead. The selected remedial action for the site includes excavating the carbon waste pile and transporting the waste offsite to an incinerator facility and disposing of the ash in an offsite RCRA hazardous-waste landfill.

3535 (PB–89-229595/XAB) **Superfund Record of Decision (EPA Region 3): Wildcat Landfill, DE. (Second Remedial Action), November 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 28 Nov 1988. 30p. (EPA/ROD/R–03-89/065). Available from NTIS, PC A03/MF A01.

See also PB–89-196752.

The Wildcat Landfill is located 2.5 miles southeast of Dover in Kent County, Delaware. A 2.7-acre pond, formed by the landfill blocking natural drainage from upland areas, is located along the northwestern border of the site. The landfill was operated as a State-permitted sanitary landfill between 1962 and 1973, accepting both municipal and industrial wastes. During its 11 years of operation, the facility routinely violated operating and other permits issued by the regulatory agencies. In August 1973 the facility was ordered closed by the state and the site owners were required to cover the site with soil and vegetation. EPA began investigating the site in 1982. Industrial wastes suspected to have been disposed of onsite include latex waste and paint sludges. The primary contaminants of concern affecting the sediments and surface water in the pond are metals including arsenic, chromium and lead. The selected remedial action for the site includes: draining, filling, and revegetating the pond area consistent with the landfill cover; constructing a new pond elsewhere on the site; implementing institutional controls for land use restrictions; and ground water-monitoring upgradient of the new pond.

3536 (BR–82(11.111)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (South Atlantic): Alewife and blueback herring.** Bozeman, E.L. Jr.; Van Den Avyle, M.J. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Coastal Ecology Group; Fish and Wildlife Service, Washington, DC (USA); Georgia Univ., Athens, GA (USA). Georgia Cooperative Fishery Research Unit. Aug 1989. 18p. Sponsored by U.S. Department of the Interior. (TR-EL–82-4/82(11.111)). Available from OSTI - US Fish and Wildlife Service, NASA-Slidell Computer Complex, 1010 Gause Blvd., Slidell, LA 70458.

Species profiles are summaries of the literature on taxonomy, life history, and environmental requirements of coastal fishes and aquatic invertebrates. They are prepared to assist with impact assessment. The alewife (*Alosa pseudoharengus*) and blueback herring (*A. aestivalis*) are morphologically and ecologically similar anadromous species of clupeids. The blueback herring is common throughout the South Atlantic Region, but the alewife occurs primarily in North Carolina and northern parts of South Carolina. These species spawn in spring in freshwater or brackish, tidally influenced portions of coastal rivers. Blueback herring initially use freshwater habitats for nursery areas, and then migrate downriver to brackish estuaries, where they overwinter prior to migrating to sea the following spring. Alewives use brackish water or tidal freshwater as nursery areas until they migrate to coastal waters in winter or the following spring. Landlocked populations of blueback herring occur in several southeastern reservoirs. Both species are ecologically important by serving as prey for many other fishes; they are economically important because they support commercial inshore and offshore fisheries. Little information is available on environmental factors that limit these species in the South Atlantic Region. Adults of both species have broad salinity tolerances, but blueback herring appear to require access to freshwater for successful reproduction. 76 refs., 2 figs., 2 tabs.

3537 (BR–82(11.113)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Pacific Southwest): Brown rockfish, copper rockfish, and black rockfish.** Stein, D.; Hassler, T.J. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Coastal Ecology Group; Fish and Wildlife Service, Washington, DC (USA); Oregon State Univ., Corvallis, OR (USA). Coll. of Oceanography; Humboldt State Univ., Arcata, CA (USA). California Cooperative Fishery Research Unit. Sep 1989. 15p. Sponsored by U.S. Department of Defense; U.S. Department of the Interior. (TR-EL–82-3/82(11.113)). Available

from OSTI; US Fish and Wildlife Service, NASA-Slidell Computer Complex, 1010 Gause Boulevard, Slidell, LA 70458.

Species profiles are literature summaries of the taxonomy, morphology, range, life history, and environmental requirements of coastal aquatic species. They are designed to assist in environmental impact assessment. Rockfishes are the basis of very important sport and commercial fisheries in the northeastern Pacific. Exploitation is increasing. Brown rockfish (Sebastes auriculatus), copper rockfish (S. caurinus), and black rockfish (S. melanops) are three important members of this family. Two of the species occur throughout the Pacific Southwest region; the black rockfish occurs only from about Santa Barbara northward. The habitats and foods differ significantly among species, although at certain time and places they may overlap. Black rockfish tend to be pelagic; the other two species are benthic. Their foods generally reflect these differences in habitats. These species may compete with one another and with other rockfish and benthic species for habitat. The environmental factors determining distribution, growth, and survival are generally unknown. All rockfish have internal fertilization and bear live young. The reproductive behavior, spawning times, and spawning areas of these species are poorly known, although larvae of all have been described. Growth patterns are not well understood. All three species are apparently rather long-lived.

3538 (BR–85(7.27)) **The ecology of riparian habitats of the southern California coastal region: A community profile.** Faber, P.M.; Keller, E.; Sands, A.; Massey, B.M. National Wetlands Research Center, Slidell, LA (USA); Faber (Phyllis M.), Mill Valley, CA (USA); Keller (Ed), Santa Barbara, CA (USA); Sands (Anne), Mill Valley, CA (USA); Massey (Barbara M.), Long Beach, CA (USA). Sep 1989. 152p. Sponsored by U.S. Department of the Interior. Available from NTIS, PC A08/MF A01 - OSTI.

In the 200 years since California's settlement by Europeans, almost every river in southern California has been channelized or dammed to allow development on the floodplains, causing the loss of a highly productive ecosystem. The riparian zone occurs along streambanks where soils are fertile and water is abundant; amphibians, reptiles, birds, and mammals all move back and forth across the riparian zone from streams into adjacent wetland and upland areas. Irreversible alterations of the riparian ecosystem result from the diversion or loss of transported water to the system through diking, damming, channelization, levee building, or road construction. Clearing for crops, grazing, or golf courses is potentially reversible as long as the water supply remains unaltered. Successful restoration work requires early agreement on project goals, site-specific restoration design, correct project implementation, enforcement of permit conditions, a maintenance and management program, and long-range monitoring. 288 refs., 54 figs., 13 tabs.

3539 (DOE/ER/60301–10) **Pathogenic regulation of running water macroinvertebrates: Progress report, January 1, 1989–October 15, 1989.** Cummins, K.W.; Wilzbach, M.A. Pittsburgh Univ., PA (USA). Pymatuning Lab. of Ecology. 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-85ER60301. Order Number DE90002704. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The research during the second year focused on a large scale laboratory and field experiment on factors regulating growth and mortality of populations of the stream shredder caddisfly *Pycnopsyche guttifer*. This species, which is an obligate shredder feeding on leaf litter in woodland streams during its autumn-winter growth period, was selected because of the extensive pool of background data that are available, the ease with which its terrestrial eggs can be collected, and its suitability for laboratory culture and field observations. The species is univoltine and it is widely distributed in the eastern US, but did not occur naturally in the specific stream, Piney Run, MD, into which a population was introduced. 13 figs., 1 tab.

3540 (GSF–26/88) **Distribution of heavy metals and anions in the groundwater of quaternary gravel deposits in the Munich area (Dornach). Laboratory and field test results.** Zahn, M.T. Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Inst. fuer Hydrologie; Muenchen Univ. (Germany, F.R.). Fakultaet fuer Geowissenschaften. Dec 1988. 147p. (In German). Order Number DE90717914. Available from NTIS (US Sales Only), PC A07/MF A01.

The following 10 substances were selected, the occurence of which in groundwater is of particular interest either because of their toxicity or in connection with the fertilization of agricultural areas or in connection with the erosion of primary or secondary deposits: As, Pb, Cd, Hg, K, Na, nitrate, sulphate, chloride, phosphate and fluoride. The harmful substances selected were applied as tracers in the groundwater of a test field as well as in a continuous flow column and partly in batch tests in the laboratory. In the field tests and in the continuous flow column the fluorescent dye Uranin was simultaneously used as a conservative comparative tracer. Thus the migration behaviour of the particular chemical tracer could be detected under the given chemical, physical, biological and hydraulic marginal conditions in the test field and in the column. For most of the substances two or three field tests were carried out with respectively different concentrations. The tracer input concentrations were varied according to the expected dilution, the detection limit and the particular subsoil pollution. Well water-soluble tracer compounds were used as labelling material. Altogether 19 field tests, 24 column tests and 24 batch tests were carried out in order to evaluate the mobility of the 10 tracers used in the groundwater and in the ventilated laboratory water. (orig./MG).

3541 (PNL–7103) **Survey of Columbia River Basin streams for giant Columbia River spire snail Fluminicola columbiana and great Columbia River limpet Fisherola nuttalli.** Neitzel, D.A.; Frest, T.J. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 59p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE90002586. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Surveys have confirmed the survival of both the giant Columbia River spire snail Fluminicola columbiana and the great Columbia River limpet Fisherola nuttalli in the Hanford Reach of the Columbia River, Washington State, as well as other sites in Washington, Oregon, and Idaho. A review of historical collection records suggests that both species exist in still other sites of the Columbia River Basin. At present, there is insufficient information to allow adequate appraisal of either species relative to possible federal or state listing as endangered or threatened species. The results of our studies suggest that additional undiscovered populations of both species exist. There is a relatively good chance that pristine habitat required by spire snails and limpets remains in 37 streams or portions of streams in Washington, Oregon, Idaho, and Montana (British Columbia was considered outside the project scope). For a thorough survey, visits to more than 600 sites will be required. 20 refs., 5 figs., 7 tabs.

3542 (AD-A–210641/7/XAB) **Installation-Restoration Program Stage 3. McClellan AFB, California. Remedial investigation/feasibility study ground-water sampling and analysis program, January through March 1989 data summary. Final report, January-March 1989.** Radian Corp., Sacramento, CA (USA). 19 Jun 1989. 145p. Available from NTIS, PC A07/MF A01.

Includes 9 Folders with Charts.

This Data Summary presents the results of ground-water sampling activities conducted on and in the vicinity of McClellan Air Force Base from the sampling period of January through March, 1989. Concentrations of purgeable halocarbons and aromatic compounds detected in 336 wells 26 monitoring wells are located on base in Area A, B, C, D, and adjacent on-base areas and off-base in the Northwest and Southwest areas. There was no detected increase in the areal extent of contaminated ground-water, nor was there any increase in the depth that contaminated ground-water was detected. The Area D extraction system is effectively operating to change hydraulic gradients, so groundwater in Area D flows toward the extraction wells. Contaminant concentrations have decreased in Area D deep zone monitoring wells. Samples from three middle-zone monitoring wells located in Area D also show decreases in contaminant concentration during this sampling period.

Decreasing contaminant concentrations have stabilized in shallow zone monitoring wells located off-base, west of Area D.

3543 (AD-A-211153/2/XAB) **Sediment-water interactions and contaminants in Corps of Engineers reservoir projects. Final report.** Gunnison, D.; Brannon, J.M.; Mills, A.L.; Blum, L.K. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. Jul 1989. 51p. (WES/TR/E-89-2). Available from NTIS, PC A04/MF A01.

Contaminants in Corps of Engineers (CE) reservoir and waterway projects have caused problems in the past. The potential for these contaminants to cause additional problems has increased as more-sophisticated water-quality sampling programs and analyses have been adopted by field offices. Contaminant sediment-water interactions are major mechanisms determining contaminate levels in project waters and availability to contaminants for biological uptake. This report examines the literature on sediment-water interactions and contaminant processes with respect to the unique conditions present in reservoirs. The report also examines the results of CE District surveys conducted to determine the nature and magnitude of contaminant problems in reservoir projects. Recommendations for future investigations are made based on the frequency of contaminant occurrence in CE projects and the major mechanisms for contaminant interaction with sediment and water.

3544 (AD-A-211198/7/XAB) **Formulation of water-quality models for streams, lakes, and reservoirs: Modeler's perspective. Final report.** Stefan, H.G.; Ambrose, R.B.; Dortch, M.S. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. Jul 1989. 82p. (WES/MP/E-89-1). Available from NTIS, PC A05/MF A01.

This report gives an overview of process descriptions, assumptions, constraints, and other considerations that enter into the development of deterministic mathematical surface-water-quality models. Modeling of hydrodynamic transport is treated separately for standing waters' (lakes, reservoirs, ponds, and impoundments) and flowing waters (rivers and streams). Some information on sediment transport as it relates to water quality is presented. Models addressing organic wastes and nutrients, synthetic organic chemicals, and metals transport and transformation are addressed in separate sections. The review ends with an outlook towards challenges and possible future developments.

3545 (DOE/ER/60431-3) **Field-flow fractionation in the analysis of energy-related materials: Final report, April 1, 1986-March 31, 1989.** Giddings, J.C. Utah Univ., Salt Lake City, UT (USA). 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER60431. Order Number DE90003045. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The achievements of our three-year DOE supported project fall into two main categories. First, field-flow fractionation methodology has been applied to complex samples such as humic substances from a variety of sources and colloidal particles in river water. Second, the FFF methods have been developed and refined with the goal of approaching complex samples. In the final report, we first discuss the basic particle characterization work and then summarize the energy-related applications. The publications are listed which report project results during the support period; they are cited by number in the final report text.

3546 (EGG-M-88376) **Biosorption of molybdenum and chromium.** Pryfogle, P.A.; Maiers, D.T.; Wichlacz, P.L.; Wolfram, J.H. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE90002073. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The effects of metal solution concentration, biomass density, length of exposure time, and pH were determined for biosorption of molybdenum (Mo) and chromium (Cr) by three organisms. Results indicate that it is possible to sorb Mo and Cr from dilute solutions. Differences were observed in the abilities of an organism to sorb Mo and Cr as well as among respective abilities of the three microorganisms. This suggests an inherent selectivity of the organism which may afford the selectivity of the organism which may afford the means to control a sorption-based process. Results also indicate that the metal sorption abilities of these microorganisms depend on duration of exposure, biomass density, solution pH, and the metal concentration of the solution. Each of these parameters suggests an additional means of controlling the sorption process. 20 refs., 6 figs., 3 tabs.

3547 (GAO/RCED-89-38) **Water pollution: More EPA action needed to improve the quality of heavily polluted waters.** General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div. 1989. 51p. Available from US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

In 1972 the Clean Water Act set the stage for the Environmental Protection Agency and the states to focus on technology-based controls to limit pollutants discharged into bodies of water. Although considerable sewage treatments plant construction has been completed and technology-based standards have been implemented in the states of Region X (Oregon, Washington, Idaho, and Alaska), 602 segments of rivers and streams are water-quality-limited. The states have yet to fully implement the more stringent requirements of the act - the setting of total maximum daily loads. Reasons why states have not implemented the requirements are discussed in this paper.

3548 (HW-32809) **Columbia River situation: A semi-technical review.** Parker, H.M. Hanford Works, Richland, WA (USA). 19 Aug 1954. 10p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE90002517. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Declassified 3 May 1989.

Contamination of the Columbia River by reactor effluent has been studied with increasing intensity since the start of the Hanford operations. Enough is known of the various ramifications of this complex problem to identify the salient features. As the problem progressively intensifies, the applicable research programs can be modified to amplify those phases which will become more troublesome. At the present time, the situation involves the disposal of about 8,000 curies of radioactive material per day to the river. In addition to the radiation hazard, there are problems, or potential problems arising from chemical toxicity and from thermal effects in the river. Present analysis at this site indicates that all recognized hazard forms are adequately controlled. Projection into the future indicates an over-all favorable position, with some questionable features of damage to aquatic life and secondary hazard to man through sport fishing. Due to the extreme political sensitivity of the river management, it may be expedient to impose certain controls in the interest of the Commission's and its prime contractors' public relations position, at lower levels than the scientists of the contactors' forces deem to be absolutely necessary. Vigorous small-scale research is currently in progress to develop economical means of avoiding or reducing radioactive waste disposal to the river. Ultimately the solution can be achieved by recirculating cooling systems. It is worthy of note that power-producing reactors at this site would automatically provide this relief. 24 refs., 1 tab.

3549 (PB-89-205611/XAB) **Methods for aquatic toxicity-identification evaluations. Phase 3. Toxicity confirmation procedures. Technical report.** Mount, D.I. National Effluent Toxicity Assessment Center, Duluth, MN (USA). Feb 1989. 28p. (EPA-600/3-88/036). Available from NTIS, PC A03/MF A01.

See also PB-89-207005.

Various procedures are described that provide evidence that the suspected toxicants in effluents are the actual toxicants. These procedures include: correlation, symptoms, relative sensitivity, spiking, mass balance, and miscellaneous procedures.

3550 (PB-89-207005/XAB) **Methods for aquatic toxicity-identification evaluations. Phase 2. Toxicity identification procedures. Technical report.** Mount, D.I.; Anderson-Carnahan, L. National Effluent Toxicity Assessment Center, Duluth, MN (USA). Feb 1989. 32p. (EPA-600/3-88/035). Available from NTIS, PC A03/MF A01.

See also PB-89-125934 and PB-89-205611.

This manual describes test methods that can be used to provide evidence as to whether non-polar organics, ammonia, or cationic

metals cause effluent toxicity. These methods are not intended to be irrefutable evidence but only to be providers of enough evidence to suggest that Phase III, the toxicity confirmation, should be started. Phase III uses available methods to provide adequate evidence that the true cause of toxicity is consistently due to the identified toxicants.

3551 (PB–89-214449/XAB) **Influence of discharge and urbanization on the concentration, speciation, and bioavailability of trace metals in the Raritan River, New Jersey. Final report.** McLaughlin, F.B.; Ashley, G.M.; Renwick, W.H. Rutgers–the State Univ., New Brunswick, NJ (USA). Center for Coastal and Environmental Studies. 1988. 85p. Available from NTIS, PC A05/MF A01.

The Raritan River and its tributaries are a vital drinking water and recreational resource in central New Jersey. These waters also serve as disposal media for municipal and industrial wastes and urban stormwater runoff. Rapid development over the last several decades has intensified the pressures on the quality and use of Raritan waters. The concentration and speciation of ten trace metals (Ag, As, Cd, Co, Cr, Cu, Hg, Ni, Pb, Zn) were investigated in the Raritan Basin. From September 1985 to April 1987, one hundred twenty depth-integrated samples were collected at four locations and analyzed by Direct-Current Plasma Atomic Emission Spectrometry for concentrations of dissolved, particulate-associated, total, and suspended sediment trace metals. The concentrations of trace metals readily available, potentially available, and not available to aquatic and terrestrial biota are also reported. Discharge is the most important factor influencing the concentration and speciation of trace metals in the Raritan River and its tributaries. Seasonal variations affect speciation patterns, but have a minor impact on concentration and availability to biota. The sub-basin draining a more-urbanized area in the Raritan Basin appeared to have elevated concentrations and increased biological availability of trace metals relative to less-urbanized basins.

3552 (PB–89-215552/XAB) **Characterization of year-round sensitivity of California's Montane Lakes to acidic deposition. Final report, October 1986-June 1989.** Sickman, J.O.; Melack, J.M. California Univ., Santa Barbara, CA (USA). Dept. of Biological Sciences. 1 Jun 1989. 116p. Available from NTIS, PC A06/MF A01.

Four high-elevation, lake watersheds in the Sierra Nevada were studied from October 1986 through June 1988. Researchers measured wet deposition, lake outflow and lake chemistry and physics at these sites using the mass-balance approach to relate the effect of wet deposition on lake and stream water chemistry. Crystal and Ruby Lakes, located on the eastern slope of the Sierra, and Topaz and Pear Lakes, located on the western slope in Sequoia National Park, were found to be dimictic. Major solute concentrations in the subsurface reached a minima during the latter part of snowmelt. Near-bottom concentrations of these solutes generally had less seasonal variation and were generally higher than subsurface values. Mean snow depth and chemical concentrations were similar for the winters of 1986-87 and 1987-88 at all watersheds. Volume-weighted mean pH ranged from 5.3 to 5.5, with the dominant ion being hydrogen, ammonium, acetate, nitrate and sulfate. Wet deposition as mixed rain and snow occurring between May and October can deliver more solutes to the watersheds than winter snows.

3553 (PB–89-219539/XAB) **Geographic information system documentation of watershed data for Direct/Delayed Response Project, Southern Blue Ridge Province data base.** Mortenson, D.C. NSI Technology Services Corp., Corvallis, OR (USA). Mar 1989. 34p. Available from NTIS, PC A03/MF A01.

See also PB–89-222483.

The Direct/Delayed Response Project (DDRP) was designed by the U.S. Environmental Protection Agency within the National Acid Precipitation Assessment Program to predict the long-term response of watersheds and surface waters to acidic deposition. The purpose of the DDRP is to investigate and distinguish the time scales over which surface-water systems might change chemically under varying levels of acidic deposition. The DDRP is examining a subset of watersheds sampled as part of the National Surface Water Survey. In the Southern Blue Ridge Province Region of the United States, 35 watersheds are under study. The DDRP required detailed watershed information on those characteristics thought important relative to the effects of acid deposition. The information was then mapped, then entered into a Geographic Information System (GIS). The document discuss protocols, guidelines, and standards used to complete GIS entry of the mapping data, and quality-control procedures were used to ensure accuracy and consistency.

3554 (PB–89-219992/XAB) **In-situ aquifer restoration of chlorinated aliphatics by methanotrophic bacteria. Research report, 1 May 1985-30 April 1989.** Roberts, P.V.; Semprini, L.; Hopkins, G.D.; Grbic-Galic, D.; McCarty, P.L. Stanford Univ., CA (USA). Dept. of Civil Engineering. Jul 1989. 232p. Available from NTIS, PC A11/MF A01.

The project evaluated the potential of enhanced in-situ biotransformation of chlorinated aliphatic solvents by a bacterial community grown on methane under aerobic conditions. The target chlorinated compounds were trichloroethene (TCE), cis- and trans-1,2-dichloroethene (DCE), and vinyl chloride. Laboratory studies were conducted to improve understanding of the microbial growth and transformation rates and to characterize important transport properties. In field experiments, biostimulation was accomplished by introducing methane and oxygen into a shallow, confined, sand and gravel aquifer to encourage the growth of a native bacterial community. Methane utilization commenced within ten days in the first biostimulation attempt, and within one day in subsequent biostimulation episodes. Biotransformation of the target organic compounds ensued immediately after commencement of methane utilization, and reached steady-state values within three weeks. Mathematical modeling of the transport and transformation process confirmed that the behavior observed in the field demonstration was consistent with the results of the laboratory research and theoretical expectations.

3555 (PB–89-222483/XAB) **Geographic information system documentation of watershed data for Direct/Delayed Response Project. Northeast data base.** Mortenson, D.C. NSI Technology Services Corp., Corvallis, OR (USA). Mar 1989. 47p. Available from NTIS, PC A03/MF A01.

See also PB–89-219539.

The Direct/Delayed Response Project (DDRP) was designed by the U.S. Environmental Protection Agency within the National Acid Precipitation Assessment Program to predict the long-term response of watersheds and surface waters to acidic deposition. The purpose of the DDRP is to investigate and distinguish the time scales over which surface water systems might change chemically under varying levels of acidic deposition. The DDRP is examining a subset of watersheds sampled as part of the National Surface Water Survey. In the Northeast Region of the United States, 145 watersheds are under study. The DDRP required detailed watershed information on those characteristics thought important relative to the effects of acid deposition. The information was then mapped, then entered into a Geographic Information System (GIS). The document discusses protocols, guidelines, and standards used to complete GIS entry of the mapping data, and quality control procedures used to ensure accuracy and consistency.

3556 (PB–89-222624/XAB) **Formation and control of nontrihalomethane by-products.** Stevens, A.A.; Moore, L.A.; Miltner, R.J. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. 1989. 20p. (EPA–600/D-89/037). Available from NTIS, PC A03/MF A01.

Hundreds of organic byproducts of chlorination are now known to occur in drinking water along with the trihalomethanes. About twenty of these appear to be found with sufficient frequency and in sufficient concentration to attract consideration for regulations. These include chloral hydrate, chloropicrin, a trichloropropanone, haloacetonitriles, and haloacetic acids. Trihalomethane concentrations do not serve as good predictors of concentrations of these other byproducts because their conditions of formation vary widely. This is especially true when pH is changed. Treatment strategies for control of these byproducts including the trihalomethanes are: Remove the compounds after they are formed; Remove precursors; and Use other disinfectants. Current evidence supports the idea that precursor removal processes effective for trihalomethane control may be effective for the other byproducts as well.

3557 (PB–89-224455/XAB) **Establishment of a Ground Water Research Data Center for validation of subsurface flow and transport models. Final report, August 1986-November 1988.**

van der Heijde, P.K.M.; Elderhorst, W.I.M.; Miller, R.A.; Trehan, M.F. International Ground Water Modeling Center, Indianapolis, IN (USA). Jul 1989. 238p. Available from NTIS, PC A11/MF A01.

The International Ground Water Modeling Center has established a Groundwater Research Data Center which provides information on research data sets resulting from publicly funded field experiments regarding soil and ground water pollution and related laboratory bench studies, and which distributes selected public domain datasets for testing and validation of models for flow and contaminant transport in the saturated and unsaturated zones of the underground. To fulfill its advisory role, the Data Center analyzes information and documentation resulting from field and laboratory experiments and evaluates the appropriate datasets for their suitability in model testing and validation. The Data Center has developed a computerized data directory, SATURN, programmed independently from any proprietary software. In addition to providing referral services, the Data Center distributes on an as-is basis, selected, high-quality datasets described in the data directory. The datasets of concern represent different hydrological, geological, and geographic-climatic settings, pollutant compositions, and degrees of contamination.

3558 (PB–89-224604/XAB) **Development of an inventory of materials potentially sensitive to ambient atmospheric acidity in the South Coast Air Basin. Final report.** Horie, Y.; Shrope, A.; Ellefsen, R. Valley Research Corp., Van Nuys, CA (USA). Mar 1989. 234p. Available from NTIS, PC A11/MF A01.

An inventory of exposed materials for residential and nonresidential buildings and nonbuildings was developed. The inventory of the residential buildings was developed by conducting telephone surveys of 1,200 households and field surveys of 200 households. The inventory of multi-family residential buildings and nonresidential buildings was conducted by aerial photo analysis. The inventory of nonbuilding materials (infrastructure) was developed by conducting a limited survey and by using engineering calculations. The investigators extrapolated the inventory to the entire using the building-count method.

3559 (PB–89-224695/XAB) **Water resources data for Wisconsin, Water Year 1988. Water-data report (Annual), 1 October 1987-30 September 1988.** Holmstrom, B.K.; Kammerer, P.A.; Erickson, R.M. Geological Survey, Madison, WI (USA). Water Resources Div. May 1989. 439p. (USGS/WRD/HD–89/264). Available from NTIS, PC A19/MF A01.

See also report for 1987, PB–89-130801.

Water-resources data for the 1988 Water Year for Wisconsin include records of streamflow at gaging stations, partial-record stations, and miscellaneous sites; records of chemical, biological, and physical characteristics of surface and ground water. Records of chemical analysis of precipitation, surface and ground water associated with acid deposition are included. In addition, water levels in observation wells are reported.

3560 (PB–89-224885/XAB) **Use of ground-penetrating radar to define recharge areas in the Central Sand Plain. Technical completion report.** Bohling, G.C.; Anderson, M.P.; Bentley, C.R. Wisconsin Univ., Madison, WI (USA). Water Resources Center. 1989. 72p. (WIS-WRC–89-01). Available from NTIS, PC A04/MF A01.

Contamination of ground water by agricultural chemicals in the Central Sand Plain (Portage County in Wisconsin) has prompted studies of ground water flow in the region. Because the ground water system is particularly susceptible to contamination in areas where ground water recharge occurs, identification of recharge zones can contribute significantly to the effective management of agricultural chemical use. An accurate map of water-table elevation (ground water head) is crucial to identifying the distribution of recharge. The reliability of ground-penetrating radar as a total for obtaining high resolution maps of water table elevation was assessed. Sparse subsets of wells in the area were used to calibrate the radar; water-table depths obtained from these calibrations were compared to known water-table depths in the remaining wells. Three wells are the minimum needed to obtain an estimate of uncertainty in calibration parameters; specifically, the radar signal velocity in the subsurface materials and the return time correction factor. If several wells distributed throughout a region of interest yield consistent calibration results, radar can be used to produce a map of water-table elevation for that region.

3561 (PB–89-229819/XAB) **Comparison of bioassays for assessing sediment toxicity in Puget Sound. (Appendices included). Report for 1988-1989 (Final).** Pastorok, R.A.; Becker, D.S. PTI Environmental Services, Bellevue, WA (USA). May 1989. 147p. Available from NTIS, PC A07/MF A01.

This study evaluated the relative performance of several bioassays used to assess toxicity of Puget Sound sediments. Selected bioassays were conducted simultaneously on the same array of sediment samples, and direct comparisons were made among the various tests in relation to specific performance criteria. The bioassays and toxicity endpoints evaluated included the following: Amphipod test (Rhepoxynius abronius), percent mortality and abnormality; Amphipod test (Eohaustorius estuarius), percent mortality and abnormality; Juvenile geoduck (Panope generosa), percent mortality; Juvenile polychaete (Neanthes arenaceodentata), percent mortality and percent reduced biomass; Echinoderm embryo test (Dendraster excentricus), percent developmental abnormality and chromosomal abnormality; Bivalve larvae test (Mytilus edulis, Crassostera gigas), percent abnormal development; Microtox saline and organic extract (Photobacterium phosphoreum), percent decrease in luminescence. The 11 evaluation criteria included: dose responsiveness, sensitivity, statistical power, cost-effectiveness, ecological relevance, ease of use, availability of test organisms, endpoint reliability, relationship to indigenous biota, holding constraints, and stage of protocol development.

3562 (PB–89-865208/XAB) **Water treatment: Air stripping. December 1981-July 1989 (Citations from the Selected Water Resources Abstracts data base). Report for December 1981-July 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 55p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning the application of air stripping techniques to water treatment, including ground-water decontamination and waste-water purification. The advantages and disadvantages of air stripping over other water-treatment processes are discussed. Cleanup of the organic emissions generated by air stripping is also considered. The primary applications of air stripping are in ground-water and soil cleanup. Other water treatment processes are discussed in separate bibliographies. (Contains 74 citations fully indexed and including a title list.)

3563 (PB–89-871057/XAB) **Wastewater treatment: Chemical industry. January 1970-September 1989 (Citations from Pollution Abstracts). Report for January 1970-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 95p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869540.

This bibliography contains citations concerning waste-water treatment in the chemical industry relative to a wide variety of industrial pollutants. Biological treatments including carbon additives are described relative to effectiveness. The removal of mercury and its compounds are included, as well as associated problems and recommendations from fertilizer and pesticide pollution. (This updated bibliography contains 250 citations, 16 of which are new entries to the previous edition.)

3564 (PB–89-871339/XAB) **Heavy metals in drinking water: Standards, sources, and effects. January 1978-September 1989 (Citations from the Life Sciences Collection data base). Report for January 1978-September 1989.** National Technical Information Service, Springfield, VA (USA). Sep 1989. 53p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869664.

This bibliography contains citations concerning the public-health aspects and documented studies of heavy-metal pollutants in drinking water. Topics include human-exposure studies and the toxicological effects incurred by ingestion. Prolonged exposure and quantification factors and effects, federal and state regulations and standards, and laboratory-animal studies are discussed. Sources from landfill contamination of ground water, acid-precipitation contributions to ground water pollution, and corrosion by-products in residential plumbing and public water-supply transport systems are

examined. (This updated bibliography contains 100 citations, 10 of which are new entries to the previous edition.)

3565 (SNV–3593) **Mercury in lake fish. Linkages to mercury and selenium in mor and historical emissions.** Nilsson, Aa.; Andersson, T.; Haakanson, L.; Andersson, A. National Swedish Environmental Protection Board, Solna (Sweden). 1989. 118p. (In Swedish). Order Number DE90719417. Available from NTIS (US Sales Only), PC A06/MF A01.

With 20 p. English summary.

This work has been carried out within a joint mercury project sponsored by some Swedish industries and the National Swedish Environmental Protection Board. The report deals with data from two databases, the first concerns 894 Swedish lakes, the other 363 mor samples. The following parameters are discussed; Hg-, organic and Se-concentrations, Hg- and Se-quantity in mor, Hg- and sulphur deposition from Swedish and continental emissions (point sources and diffuse emissions), precipitation, Hg in pike, lake area, lake mean depth, pH, colour, alkalinity, hardness, sulphur and chloride in lake water. The results are presented in four sections: 1. on geographical variations and statistical correlations for the dose parameters, 2. on lake sensitivity parameters, 3. on the effect parameter FHg, i.e. the Hg-content in 1 kg pike, and 4. on computer simulations to get insights and data on the linkage between various historical Hg-emissions and FHg. There is a long lag phase between emission reduction and reduction of FHg. The known, major Swedish emissions of Hg have already been significantly decreased, but new point sources of Hg have appeared. There has, probably, been a significant change in the character of the Hg-emissions during the last decades. Still, at the present deposition rate, the mercury amount in the Swedish soil systems is probably increasing. High FHg-values in fish in Swedish lakes will be a major environmental problem for decades to come.

3566 (UBA-FB–88-019) **Water quality criteria and management models for the tidal region of the Elbe-River.** Fluegge, G.; Gaumert, T.; Bergemann, M. Arbeitsgemeinschaft fuer die Reinhaltung der Elbe der Laender Hamburg, Niedersachsen und Schleswig-Holstein, Hamburg (Germany, F.R.); Umweltbundesamt, Berlin (Germany, F.R.). Aug 1988. 384p. (In German). Contract UFOPLAN-Nr. 10204337. Available from Copy held by UB/TIB Hannover.

The concentration of several substances, which represent the quality of waters, are varied by hydrological conditions (freshwater discharge) and seasonal influences like temperature, period of vegetation etc. The evaluation of selected quality data of the Elbe-River shows, that a strong functional relation between the parameters and natural influences does not exist. A standardization of quality data, e.g. to a certain hydrological status, as a basis for the development of load plans is not possible. Water quality criteria are presented to valuate the water quality of the tidal region of the Elbe-River, that point out, starting from the natural background as pollution grade Zero, the dimension of anthropogenic pollution by oxygen demanding matters, nutrients, heavy metals and chlorinated hydrocarbons. The defined pollution grades indicate the qualitative and quantitative need of sanitation. For the grading of the heavy metal pollution a standardization to a defined concentration of suspended matter is made. The seasonal development of the oxygen profiles along the estuary ('oxygen depletion' downstream Hamburg) and the needed sanitation steps (different variations of emissions, different preload) are calculated by an oxygen budget model of the tidal region of the Elbe-River. (orig.) With 150 tabs.

3567 (BMU–1989-207) **Accumulation of radionuclides in fish during specified normal operation of nuclear installations and after incidents. Annual report 1987.** Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten. Huebel, K.; Litzke, J.; Pawlack, I.; Wolff, S.; Jank-Raff, A.; Steinacker, R.; Gillmeister, H. Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Bayerische Landesanstalt fuer Wasserforschung, Muenchen (Germany, F.R.). 1989. 47p. (In German). Contract BMU St.Sch. 959. Available from Available from GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

The transfer factors for the passage food/body display nuclide-specific but no fish-specific differences. Cs-137 is predominantly taken in via the food, while it is definite that carps take in Sr-85 via the water; trouts on the other hand take it in equally via both paths. According to the same pattern Cyprinidae and Salmonidae take in Zn-65. It seems as if synergistical effects play a role in the accumulation of Mn-54 in the two fish species; carps take in Co-60 via the food; as for trouts no definite statements can be made. The biological half-life values obtained from the simulation of an incident in whose course the state of equilibrium is not reached, differ only slightly from the values calculated for the water respectively food path. The accumulation can be described by a simple differential equation. (orig./HP).

3568 (EPA–520/5-88-018) **Radiological survey of the Mare Island Naval Shipyard, Alameda Naval Air Station, and Hunters Point Shipyard.** Semler, M.O.; Blanchard, R.L. Environmental Protection Agency, Montgomery, AL (USA). Eastern Environmental Radiation Facility. Jun 1989. 18p. Sponsored by Environmental Protection Agency. Order Number DE89014543. Available from NTIS, PC A03/MF A01; OSTI; US Environmental Protection Agency Office of Radiation Programs, 401 M Street, SW, Washington, DC 20460.

Since 1963, the Eastern Environmental Radiation Facility (EERF), US Environmental Protection Agency (USEPA), in cooperation with the US Naval Sea Systems Command (NAVSEA) has surveyed facilities serving nuclear-powered warships on the Atlantic and Pacific coasts and the Gulf of Mexico. These surveys assess whether the operation of nuclear-powered warships, during construction, maintenance, overhaul, or refueling, have created elevated levels of radioactivity. The surveys emphasize sampling those areas and pathways that could expose the public. In 1984, NAVSEA requested that EPA survey all active facilities serving nuclear-powered warships over the next three years. This report contains the results of surveys conducted at Naval facilities located at Mare Island, Alameda, and Hunters Point in the San Francisco region. The locations of these facilities are shown. 3 refs., 4 figs., 3 tabs.

3569 (IC–89/63) **Current measurement studies around the Cesme Peninsula (Turkey).** Taspinar, N. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 15p. Order Number DE90608173. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

In order to design coastal structures and marine vehicles safely, it is required to know current climate which shows the variation of the current characteristics with time. There are a wide variety of current meters designed to measure water flow today. Each current meter is capable of recording the influence of mooring arrangement. Here we describe sea water temperatures, salinities and current velocities at offshore of Akburun, Tatlicak Burnu, Kalem Burnu and Kizil Burun areas in Cesme Peninsula 27 August, 1986 to 19 November, 1986. At the end of the investigations, measured significant maximum and average current velocities have been routinely analysed with micro-computers and also the percentages of current velocity have been calculated. (author). 8 refs, 6 figs, 4 tabs.

3570 (NIRS-M–70) **Dynamic aspects of radioactive contamination of marine organisms. Proceeding of the 14th NIRS seminar on environmental research.** Ueda, Taishi (ed.). National Inst. of Radiological Sciences, Chiba (Japan). Nov 1988. 57p. (In Japanese). (CONF-8612177–: 14. NIRS seminar on environmental research, Chiba (Japan), 5 Dec 1986). Order Number DE90719693. Available from NTIS (US Sales Only), PC A04/MF A01.

The report consists of three parts. The first part addresses the kinetics of bioconcentration of chemicals in an aquatic ecosystem. Exponential models are discussed to describe the dynamic aspects of movement (bioconcentration) of a chemical in an aquatic ecosystem. Differential equations for a two-compartment model are solved to relate the movement of a material between fish and water. Similar integrated equations are derived for a three-compartment model. Explanations are made in relation to the concept of the models,

their limitations in application to real ecosystems and bioconcentration factors. The second part deals with sea water exchange. The second reprocessing plant in Japan is being planned to be operational in 1955. A new model is now under development by CRIEPI. For the near-field sea area, a three-dimensional model is applied for predicting the three-dimensional behavior of nuclides. In the far-field area, a two-dimensional model is applied. The two- and three-dimensional models are interfaced to produce a combined model. The third part addresses the field-laboratory comparability. A study is made to estimate the concentration of radionuclides in organisms applying an exponential model which involves the reduction coefficient of radioactivity in sea water together with other biological parameters. The model is successfully applied to the reduction of ^{60}Co with time in brown algae. (N.K.).

3571 (PB–89-210629/XAB) **Radiological surveys of Naval facilities on Puget Sound. Final report.** Lloyd, V.D.; Blanchard, R.L. Environmental Protection Agency, Montgomery, AL (USA). Eastern Environmental Radiation Facility. Jun 1989. 36p. (EPA–520/5-88/016). Available from NTIS, PC A03/MF A01.

This report presents results of surveys conducted to assess levels of environmental radioactivity resulting from maintenance and operation of nuclear-powered warships at Puget Sound Naval Shipyard, Naval Submarine Base, Bangor, and the proposed Carrier Battle Group Homeporting Site in northwestern Washington. The purpose of the survey was to determine if activities related to nuclear-powered warships resulted in release of radionuclides that may contribute to significant population exposure or contamination of the environment.

3572 (PB–89-220891/XAB) **Final report on the investigation of water purification and waste concentration by the Vacuum Freezing Multiple Phase Transformation Process and its eutectic extension, September 1986-September 1987.** Cheng, C.Y.; Cheng, W.C. Calyxes Research and Development Corp., Albuquerque, NM (USA). 1988. 97p. Available from NTIS, PC A05/MF A01.

This study is a continuation of the study of the Volume Freezing Multiple Phase Transformation (VFMPT) process for desalination and water reuse. During the first grant period, bench-scale experiments were completed for the VFMPT process and initial design of a prototype VFMPT plant was completed. During the course of the second grant, the vacuum freezing and vapor liquefaction operations were tested in a prototype unit referred to as the 40 Inch Long unit. It was concluded that a two rotating screws half submerged in the pool would be a very energy efficient method for providing the necessary surface areas. A flowsheet was developed for the VFMPT plant with detailed mass and energy balances and energy requirements determined.

3573 (PB–89-220941/XAB) **Cape Cod Waste-water Renovation and Retrieval System. A study of water treatment and conservation. Data supplement for annual report, June 11, 1974-June 10, 1975. Technical report.** Kerfoot, W.B.; Ketchum, B.H.; Kallio, P.; Bowker, P.; Mann, A. Woods Hole Oceanographic Institution, MA (USA). Jan 1976. 92p. (WHOI–76-5). Available from NTIS, PC A05/MF A01.

See also PB–89-220958. Portions of this document are not fully legible.

The Cape Cod Waste-water Renovation and Retrieval System evaluated alternative means of waste-water treatment and developed design criteria for the recharge of water of potable quality to the ground-water reservoir of the coastal outwash plains of Cape Cod and the Islands. The three-year plan involved investigation of the in-situ performance of (1) the existing sand-filter bed at Otis Air Force Base, (2) a rapid infiltration system designed to enhance biological denitrification, and (3) a spray irrigation-cropping program. The quantity and quality of the treated water, the receiving water, and the character of the soil were carefully examined to project eventual water condition after many years of operation.

3574 (PB–89-220958/XAB) **Cape Cod Waste-water Renovation and Retrieval System. A study of water treatment and conservation. Interim report, June 11, 1975-June 10, 1976. Technical report.** Ketchum, B.H.; Vaccaro, R.F.; Kallio, P.E.; Mann, A.; Deese, P.L. Woods Hole Oceanographic Institution, MA (USA). Oct 1976. 140p. (WHOI–76-93). Available from NTIS, PC A07/MF A01.

See also PB–89-220941.

The Cape Cod Waste-water Renovation and Retrieval System evaluated alternative means of waste-water treatment and developed design criteria for the recharge of water of potable quality to the ground-water reservoir of the coastal outwash plains of Cape Cod and the Islands. The three-year plan involved investigation of the in situ performance of (1) the existing sand-filter bed at Otis Air Force Base, (2) selected varieties of animal forage grasses, and (3) various rates of application of secondary effluent. The quantity and quality of the treated water, the receiving water, and the character of the soil were carefully examined to project eventual water condition after many years of operation.

3575 (PB–89-224935/XAB) **Ground-water research: Technical-Assistance Directory.** Environmental Management Support, Silver Spring, MD (USA). 17 May 1989. 49p. Available from NTIS, PC A03/MF A01.

The Directory, a revision of the first edition (EPA/600/9-87/008) published by ORD in March 1987, is intended to foster communication among scientists and engineers throughout EPA's Office of Research and Development (ORD) and among EPA, state, and local personnel involved in the protection and management of ground-water resources. In addition to listing ORD researchers by location and subject matter, the Directory provides brief organizational descriptions of the ground-water research programs for each ORD office. These descriptions may aid in locating assistance in areas not covered by the subject indices.

3576 (PB–89-225585/XAB) **Selection with minimal bias, of an experimental control from natural wetland environments. Technical report (Final).** Tiedemann, R.B. Rutgers–the State Univ., New Brunswick, NJ (USA). 1988. 40p. Available from NTIS, PC A03/MF A01.

The goal of wetland restoration and creation projects is to replicate the native wetland vegetation. The objective evaluation of wetland revegetation, as well as experiments designed to assess the ability of various wetland revegetation methods to replicate the native community, require a representative control site to distinguish between natural variability and that attributable to a treatment. The bias of the investigator often plagues what is intended to be a subjective selection of a control site. This study is designed to census vegetation species compositive of the native community. The study tests the following hypotheses: intentional revegetation as compared to natural colonization will establish a community of vegetation that more closely resembles a native wetland community, and intentional revegetation will establish a community of vegetation more rapidly than natural colonization.

3577 (AD-A–210485/9/XAB) **Waste-water characterization survey, Little Rock AFB, Arizona. Final report, 11-24 July 1988.** Scott, S.P. Air Force Occupational and Environmental Health Lab., Brooks AFB, TX (USA). May 1989. 44p. (AFOEHL–89-040EQ0109ESC). Available from NTIS, PC A03/MF A01.

The AFOEHL conducted a waste-water characterization survey at Little Rock AFB from 11 to 24 Jul 88. The scope of the survey included characterizing the major sanitary discharges on base and determining whether the waste-water being discharged to the Jacksonville Wastewater Treatment plant violated limits for biochemical oxygen demand and total suspended solids. A total of 26 sampling sites were evaluated. Analytical results showed that discharge standards for biological oxygen demand and total suspended solids were not being exceeded by Little Rock AFB.

3578 (PB–89-218770/XAB) **Translating research into practice: The drinking-water industry.** Clark, R.M. Environmental Protection Agency, Cincinnati, OH (USA). Risk Reduction Engineering Lab. 1989. 23p. (EPA–600/D-89/014). Available from NTIS, PC A03/MF A01.

The Water Supply Industry is very conservative in adopting major changes in water-supply treatment. An increased number of regulations and an accelerated regulatory agenda has the potential for revolutionizing this field. Technology transfer and information diffusions will be very important in helping the water utilities meet these new regulations. EPA and other agencies are investing heavily in technology transfer. The author suggests a Drinking Water Innovative Technology Program as a mechanism for accelerating information production.

3579 (PB–89-219224/XAB) **Superfund Record of Decision (EPA Region 2): Lipari Landfill, Mantua Township, Gloucester County, New Jersey, July 11, 1988. Third remedial action. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 11 Jul 1988. 139p. (EPA/ROD/R–02-88/074). Available from NTIS, PC A07/MF A01.

Portions of this document are not fully legible.

The Lipari Landfill site is a municipal- and industrial-waste landfill in Mantua Township, Gloucester County, New Jersey. The landfill consists of an 'onsite' and an 'offsite' portion. This remedial action addresses the offsite portion of the site which is the area outside of the encapsulation system consisting of agricultural and residential areas that include several lakes, streams, and parks. Offsite investigations indicate that lakes, streams, and marshland in the area surrounding the site has been impacted by contaminant migration from the landfill. The primary contaminants of concern affecting the ground water, surface water, sediments, soil and air are VOCs including benzene, toluene, and xylene, and metals including arsenic, chromium, and lead. The selected remedial action for the offsite areas includes: collection of the contaminated ground water/leachate, followed by onsite treatment and discharge to POTW; excavation of contaminated marsh soil, and dredging and dewatering contaminated sediments, followed by thermal treatment and offsite disposal as nonhazardous material; integration of offsite sampling with the onsite monitoring plan being developed to monitor the effectiveness of the onsite flushing action; and temporary remedial measures in the surrounding marshland, if necessary, to mitigate volatile emissions from leachate seepage areas.

3580 (PB–89-219612/XAB) **Role of standards in Iowa's ground-water protection program: A report to the Iowa General Assembly.** Combs, J.; Koch, D.; Kelley, R.; Smith, L.; Whuk, M. Iowa Dept. of Natural Resources, Des Moines, IA (USA). Jan 1989. 58p. Available from NTIS, PC A04/MF A01.

See also PB–89-219620 and PB–87-178877.

This report, required by the Iowa General Assembly, contains an analysis of the role of ground-water standards in the state's overall ground-water protection efforts. The analysis includes discussion of the historical use of standards for environmental protection, current federal and state programs that use standards, Iowa's current ground-water protection program, and the potential role of standards for ground-water in Iowa. The report makes three specific recommendations on the role of groundwater standards: to continue and enhance the current program of preventing contamination through research, demonstration and education; to adopt cleanup guidelines, based on current EPA lifetime health advisories (for contaminants in drinking water), to direct cleanup of existing areas of contamination; and to require development and implementation of a control strategy for non-point source contamination, in the event voluntary efforts are unsuccessful.

3581 (PB–89-219620/XAB) **Role of standards in Iowa's ground-water protection program: A report to the Iowa General Assembly. Appendix 2. Written comments.** Iowa Dept. of Natural Resources, Des Moines, IA (USA). Jan 1989. 338p. Available from NTIS, PC A15/MF A01.

See also PB–89-219612.

The report, contains copies of all the written comments and letters received by the Department of Natural Resources during the public comment period on ground-water standards.

3582 (PB–89-220974/XAB) **Supplemental risk-assessment guidance for the Superfund program. Part 1. Guidance for Public-Health Risk Assessments. Part 2. Guidance for ecological Risk Assessments. Draft report (Final).** Environmental Protection Agency, Boston, MA (USA). Region I. Jun 1989. 114p. (EPA–901/5-89/001). Available from NTIS, PC A06/MF A01.

Portions of this document are not fully legible.

This guidance manual was developed to address the practical aspects and issues pertaining to the Superfund risk-assessment process for both public health and environment concerns. Part 1, Guidance for Public Health Risk Assessments, supplements the Superfund Public Health Evaluation Manual and Superfund Exposure Assessment Manual and the Endangerment Assessment Handbook. Explicit guidance on technical matters which should be followed in developing public health risk assessments for EPA Region 1. The guidance addresses hazard identification, dose-response assessment, exposure assessment, risk characterization, and uncertainty/limitations. Part 2 of the manual, Guidance for Ecological Risk Assessments, addresses the collection of site-specific data needed to support an ecological risk assessment, describes a framework for conducting the assessments, and provides several specific approaches for assessing risks to systems exposed to chemical contamination in different media.

3583 (PB–89-224901/XAB) **Performance testing of Method 1312. QA (quality assurance) support for RCRA (Resource Conservation and Recovery Act) testing: Project report.** Chiang, T.C.; Valkenburg, C.A.; Miller, D.A. Lockheed Engineering and Sciences Co., Inc., Las Vegas, NV (USA). Jun 1989. 114p. Available from NTIS, PC A06/MF A01.

The question of how to access the risks associated with ground water contamination from soils containing toxic substances is a critical issue for the Agency. A major limitation of using Method 1310 and 1311 for this purpose is the fact that the sanitary landfill codisposal scenario does not apply to contaminated soils. If these methods are used to assess sites for cleanup purposes, the acetic acid leaching fluid could selectively solubilize toxicants (specifically lead) and incorrectly classify the solid as hazardous when, in fact, no mobilization (leaching) would be expected to occur in the environment. The EPA is considering the use of a newly created synthetic acid precipitation leach test for soils (Method 1312) to provide information about the mobility (leachability) of both organic and inorganic contaminants present in soils.

3584 (PB–89-225486/XAB) **Superfund Record of Decision (EPA Region 5): Forest Waste Disposal, MI. (Second remedial action), March 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 31 Mar 1988. 141p. (EPA/ROD/R–05-88/062). Available from NTIS, PC A07/MF A01.

See also PB–87-189890.

The Forest Waste Disposal site consists of an 11-acre, abandoned municipal and industrial waste landfill and 9 surface impoundments. It is located in Genesee County, Michigan, 20 miles northeast of Flint, and is surrounded by agricultural land and undeveloped woodlands and wetlands. Forest Waste Disposal conducted landfill operations from 1972-1978, receiving limited types of liquid industrial waste, general household refuse, and drummed waste until 1978. Specific waste material found within the landfill includes PBB-contaminated feed, septic sludge, and drums containing primarily solid and liquid VOCs in high concentrations. The primary contaminants of concern affecting the soil and ground water are VOCs including toluene and TCE; other organics including pesticides, PAHs and PBBs; and metals including arsenic and lead. The selected remedial action for the site includes: removal and incineration of contaminated soil; installation of a containment system including a RCRA cap, slurry wall, dewatering system and a leachate collection system; and treatment and disposal of collected leachate; deed restrictions to prevent use of the ground water as a drinking water source; access restrictions; and ground water monitoring.

3585 (PB–89-225643/XAB) **Local government techniques for inland wetlands protection. Technical report.** Anderson, T. Cornell Univ., Ithaca, NY (USA). Dept. of Natural Resources. 1988. 94p. Available from NTIS, PC A05/MF A01.

A fair amount of progress has been made in the area of coastal wetlands protection, but inland wetlands have been given less attention until recently. Except where non-tidal wetlands are large and associated with navigable waters, they have usually been afforded little protection. Since many areas are still in the early stages of inland wetland protection, this report concentrates on examples and techniques for inland circumstances. Most of the strategies discussed, however, could also be applied to coastal wetlands. The report also focuses on the role that local governments can play in the wetland-protection process. The federal and state governments have numerous wetlands-related programs in place, some of which may explicitly involve local governments, and other of which may affect the way the local decision maker chooses to approach the problem. A brief look at all three levels of government may help set the stage for the discussion of the local role, as well as pointing out opportunities for cooperative efforts between the Federal, State, and local levels of government.

3586 (PB–89-229512/XAB) **Superfund Record of Decision (EPA Region 3): Croyden TCE Spill, PA. (First Remedial Action), December 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 28 Dec 1988. 55p. (EPA/ROD/R–03-89/066). Available from NTIS, PC A04/MF A01.

The Croyden TCE Spill site is located in Bristol Township, Buck County, Pennsylvania. VOC contamination in the ground water was detected over a 3.5-square mile area, predominantly residential, with an estimated 3,000 residents. The study area is bordered on the south by the Delaware River. Neshaminy Creek, which borders the study area to the west, and Hog Run Creek which flows through the focused area of investigation, both discharge to the river. Although the source of contamination has not been identified, the contaminant plume appears to be flowing south-southeast into the East Branch of Hog Run Creek and probably into the Delaware River. The primary contaminants of concern affecting the ground water are TCE and PCE. The selected remedial action for the site includes connecting approximately 13 residences to the public water supply system via the construction of new water services lines, mains, hydrants, and valves; and ground water monitoring to ensure that homes located outside of the TCE-contaminated zone will not be at risk from the migrating plume.

3587 (PB–89-229520/XAB) **Superfund Record of Decision (EPA Region 5): Wausau Water Supply, WI. (First Remedial Action), December 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 12 Dec 1988. 78p. (EPA/ROD/R–05-89/086). Available from NTIS, PC A05/MF A01.

Portions of this document are not fully legible.

The Wausau Water Supply site, also known as the Wausau Ground-water Contamination site, encompasses an area in the northern section of the City of Wausau, Marathon County, Wisconsin. The site includes five of six production wells in the City Well Field and is located on both sides of the Wisconsin River. The wells supply nearly all the potable water for approximately 33,000 people, as well as irrigation and industrial water to surrounding areas. In 1982, the city discovered that wells CW3, CW4, and CW6 were contaminated with VOCs. Since that time, several systems have been implemented to reduce VOC levels in the water supply. Initially, uncontaminated water from CW9 and CW7 was blended with water from CW3, CW4, and CW6 to dilute the VOC concentrations. However, increasing VOC concentrations resulted in regulatory limits being exceeded. The primary contaminants of concern affecting the West Well Field at the site are VOCs including TCE. The selected remedial action for the site includes ground-water pumping and treatment using air stripping with discharge to the Wisconsin River; ground-water monitoring; and provision for implementation of an additional extraction well as necessary.

3588 (PB–89-229975/XAB) **Ground water protection efforts in four new england states. Technical report.** Walden, R. Environmental Protection Agency, Washington, DC (USA). Office of Cooperative Environmental Management. 5 Mar 1988. 154p. (EPA–600/9-89/084). Available from NTIS, PC A08/MF A01.

The motivation for the study (a set of four case studies) emanates from the Wellhead Protection (WHP) Program, mandated under Section 1428(e) of the Safe Drinking Water Act Amendments of 1986. The program is intended to protect areas of public water supply from sources of anthropogenic contamination that pose an existing or potential threat to public health. In anticipation of this effort, the study surveys and evaluates local ground water and wellhead protection strategies in representative, but progressive communities in New England: Springfield, Vermont; Topsham, Maine; Merrimack, New Hampshire; North Kingstown, Rhode Island. The case study method is employed on the premise that the lessons drawn from the four communities will be useful to EPA and State agencies in providing guidance to other communities in the region.

3589 (PB–89-233894/XAB) **Superfund Record of Decision (EPA Region 3): Tyson's Dump, PA. (First remedial action), March 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 31 Mar 1988. 71p. (EPA/ROD/R–03-88/045). Available from NTIS, PC A04/MF A01.

See also PB–85-213858.

Tyson's Dump, a 4-acre abandoned septic and chemical-waste disposal site, is located in Upper Merion Township, Montgomery County, Pennsylvania. Several formerly unlined lagoons were used to store various industrial, municipal, and chemical wastes. Spills and overflows reportedly occurred during the period of operation, thus allowing for the dispersal of wastes throughout the site. Surface water runoff and seeps contributed to offsite migration of the wastes toward the Schuylkill River. Immediate removal measures were initiated in January 1983. In December 1984, EPA issued an operable-unit ROD for the onsite area. Remedial actions selected in the ROD include: excavation and offsite disposal of contaminated soils and sediments; and upgrading the existing air strips to treat leachate, shallow ground water, and surface run-on. In the fall of 1985, Ciba-Geigy Corporation (CGC) agreed to conduct a further investigation of the offsite area. In November 1986, CGC initiated an onsite pilot study using an innovative vacuum extraction technology process. In June and July 1987, four responsible parties, CGC, Smith-Kline Beckman, Wyeth Laboratories, and Essex Group submitted an alternative proposal to EPA for the first operable unit cleanup.

3590 (PB–89-235212/XAB) **ROD (Record of Decision) annual report, FY 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. Jul 1989. 495p. (EPA–540/8-89/006). Available from NTIS, PC A21/MF A01.

See also report for FY87, PB–89-114144.

In FY 1988, EPA continued to implement the Superfund Amendments and Reauthorization Act of 1986 (SARA). In the remedial decision-making process, Section 121 of SARA mandates the selection of a remedial action that is protective of human health and the environment. One hundred fifty-two RODs were signed during FY 1988. This represents a 100% increase over FY 1987. Ninety-five of the FY 1988 RODs addressed final source control. The remaining 57 RODs selected ground-water remedies only (39), interim-source control actions (4), or no further action (14). Forty-nine RODs selected both source control and ground water remedies. Consistent with the policy started in FY 1986 to delegate ROD approval authority to the Regions, 99 percent of all FY 1988 RODs were approved at the Regional level.

3591 (PB–89-235279/XAB) **Superfund Record of Decision (EPA Region 2): Clothier Disposal Site, Oswego County, New York, December 28, 1988. First remedial action.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 28 Dec 1988. 98p. (EPA/ROD/R–02-89/077). Available from NTIS, PC A05/MF A01.

The Clothier Disposal site is located in a rural area near the Town of Granby, Oswego County, New York. In 1973, drums of chemical waste were discovered on the Clothier property, despite State denial of a landfill permit application. After the New York Department of Environmental Conservation brought suit, the owner made several attempts to clean up the property. These attempts resulted in drums being broken and drained. Subsequently, additional dumping of roofing materials, household wastes and junked vehicles occurred at the site. Based on the remedial investigation and State sampling, EPA established the need for a removal action for 2,200

drums located onsite. The primary contaminants of concern affecting the soil are VOCs including toluene, xylene, and PCE; other organics including PAHs; PCBs and phenols; and metals. The selected remedial action for the site includes: placement of a one-foot soil cover over the contaminated areas and regrading and revegetation of the site; installation of rip-rap, as needed, on the embankment sloping towards Ox Creek to prevent soil erosion; construction and post-construction air monitoring; institutional controls preventing the utilization of the underlying ground water, or any land use involving significant disturbance of the soil cover; and long-term ground water, soil, sediment and surface water monitoring.

3592 (PB–89-872584/XAB) **Inland wetlands legislation and management. January 1970-September 1989 (Citations from the NTIS data base). Report for January 1970-September 1989.** National Technical Information Service, Springfield, VA (USA). Oct 1989. 116p. Available from NTISPC N01/MF N01.

Supersedes PB–88-866819.

This bibliography contains citations concerning Federal and state laws and management programs for the protection and use of inland wetlands. Utilization of wetlands to control highway runoff and community waste water is discussed. Wetlands protection programs, restoration projects, resource planning, and wetlands identification methods are cited. References to coastal and saltwater wetlands are excluded from this bibliography. (This updated bibliography contains 219 citations, 37 of which are new entries to the previous edition.)

53 ENVIRONMENTAL–SOCIAL ASPECTS OF ENERGY TECHNOLOGIES

3593 (LA–11651-MS) **The degradation of natural resources in the Soviet Union.** Cernicek, M.; Pearse, S.R.; Smith, R.L. Lawrence Livermore National Lab., CA (USA). Sep 1989. 22p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CNSS/Papers–21). Order Number DE90002621. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The cost of natural resources in the USSR is increasing. The authors attribute the increased costs to excessive exploitation of natural resources and the serious degradation of resource quality. 26 refs.

3594 (NUREG–0775-Suppl.) **Final Environmental Statement related to the operation of Comanche Peak Steam Electric Station, Units 1 and 2 (Docket Nos. 50-445 and 50-446): Supplement.** Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation. Oct 1989. 11p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A03/MF A01 - GPO; OSTI; INIS.

In September 1981, the staff of the Nuclear Regulatory Commission (NRC) issued its Final Environmental Statement (NUREG-0775) related to the operation of Comanche Peak Steam Electric Station, Units 1 and 2 (Docket Nos. 50-445 and 50-446), located in Somervell County, Texas, approximately 40 miles southwest of Fort Worth, Texas. The NRC has prepared this supplement to NUREG-0775 to present its evaluation of the alternative of operating Comanche Peak with the installation of further severe-accident-mitigation design features. The NRC has discovered no substantial changes in the proposed action as previously evaluated in the Final Environmental Statement that are relevant to environmental concerns and bearing on the licensing of Comanche Peak Steam Electric Station, Units 1 and 2. 6 refs., 3 tabs.

3595 (AD-A–210225/9/XAB) **Parallel processing and learning in simple systems. Final report, 10 January 1986-14 January 1989.** Mpitsos, G.J. Oregon State Univ., Newport, OR (USA). Hatfield Marine Science Center. 15 Mar 1989. 6p. Available from NTIS, PC A02/MF A01.

Work over the three-year tenure of this grant has dealt with interrelated studies of (1) neuropharmacology, (2) behavior, and (3) distributed/parallel processing in the generation of variable motor patterns in the buccal-oral system of the sea slug Pleurobranchaea californica. (4) Computer simulations of simple neutral networks have been undertaken to examine neurointegrative principles that could not be examined in biological preparations. The simulation work has set the basis for further simulations dealing with networks having characteristics relating to real neurons. All of the work has had the goal of developing interdisciplinary tools for understanding the scale-independent problem of how individuals, each possessing only local knowledge of group activity, act within a group to produce different and variable adaptive outputs, and, in turn, of how the group influences the activity of the individual. The pharmacologic studies have had the goal of developing biochemical tools with which to identify groups of neurons that perform specific tasks during the production of a given behavior but are multifunctional by being critically involved in generating several different behaviors.

3596 (AD-A–210399/2/XAB) **Molecular biology and physiology of methanogenic archaebacteria. Annual report, July 1988-June 1989.** Nagle, D.P.; McCarthy, D.; Tanner, R.S. Oklahoma Univ., Norman, OK (USA). Dept. of Botany and Microbiology. 27 Jun 1989. 17p. Available from NTIS, PC A03/MF A01.

Methane-producing archaebacteria are worthy of their novel biology and potential in anaerobic bioprocessing. This work continues to study the biochemistry, genetics, and molecular biology of the thermophilic autotroph Methanobacterium thermoautotrophicum. DNA from antimetabolite-resistant mutant strains was used to transform sensitive recipient cells to resistance, and DNA was cloned into Escherichia coli plasmids. This DNA will be mutated with transposons in the E. coli host, then isolated and used to transform methanogen cells to selectable mutant phenotypes. Mutant strains resistant to purine analogs were used to determine that wild type cells of M. thermoautotrophicum possess an almost complete set of enzymes for uptake, activation, and interconversion of purine bases and nucleosides. These mutants and the information about the pathways will be the basis for generating a genetic map. Metabolic studies of a unique formate auxotroph revealed a new role for this one carbon compound in the anabolic metabolism of this methanogen.

3597 (AD-A–211272/0/XAB) **Binding of adenosine diphosphoribosyltransferase to the termini and internal regions of linear DNAs (deoxyribonucleic acids).** Sastry, S.S.; Buki, K.G.; Kun, E. San Francisco State Univ., CA (USA). 1989. 13p. Available from NTIS, PC A03/MF A01.

Pub. in Biochemistry, Vol. 28, 5670-5680(1989).

Adenosine diphosphoribosyltransferase ADPRT is a specific nuclear protein of higher eucaryotes that has been known primarily as a DNA-dependent enzyme catalyzing the polymerization of ADP-R derived from NAD+ to helical homopolymers that are covalently bound to ADPRT and certain other nuclear proteins. The authors have recently described a second molecular activity of this enzyme that is only secondarily regulated by the metabolic substrate of ADPRT, which is NAD+, and consists of DNA condensation following the binding of ADPRT to certain circular double-stranded DNAs, an activity that is cooperative with histones. In this paper they identify the binding of ADPRT to DNA termini with the aid of specific exonucleases by methods that have been tested in other systems (Riley

& Wientraub, 1978; Vonder Ahe et al., 1985; Slater et al., 1985; Shalloway et al., 1980; Wu, 1985; Elbrecht et al., 1985). On the other hand, the binding of ADPRT to internal regions of certain restricted double-strand DNAs proved to be more discriminating because it depended on the nature of the restricted DNA fragments.

3598 (ANL/PPRNT–89-194) **Induction and repair of DNA strand-breaks in Bacteroides fragilis.** Abratt, V.; Santangelo, J.; Woods, D.R.; Peak, M.; Peak, J. Argonne National Lab., IL (USA). [1989]. 21p. Sponsored by U.S. DOE Energy Research; U.S. Department of Health and Human Services. DOE Contract W-31109-ENG-38. R01-CA37848;R01-CA34492. Order Number DE90003008. Available from NTIS, PC A03/MF A01 - OSTI.

Alkaline sucrose gradient sedimentation was used to investigate the production and repair of strand-breaks in the DNA of a Bacteroides fragilis wild-type strain, a mitomycin C-sensitive mutant (MTC25) and a UV-sensitive mutant (UVS9). Direct UV-induced strand-breakage of B. fragilis DNA was very limited, but irradiation induced metabolically resulted strand-breakage and resynthesis in the wild-type strain under both aerobic and anaerobic conditions. Fifty percent of the strand breaks accumulated under anaerobic conditions were removed during holding in buffer, but under replicating conditions that original high number average molecular weight (M_n) of the DNA was regained. Under anaerobic conditions the UVS9 mutant showed the lowest level of UV-induced strand-breakage whereas in the MTC25 mutant strand-breakage was intermediate between the wild-type and UVS9 strains. Exposure to oxygen induced low levels of direct DNA strand-breaks which were increased by prolonged exposure of the DNA under alkaline conditions. Under aerobic conditions DNA strand-breakage and complete resynthesis occurred in the UV-irradiated wild-type strain.

3599 (ANL/PPRNT–89-198) **Comparison of the production and phenotypic properties of altered hepatocyte foci in rats initiated with diethylnitrosamine neonatally or after partial hepatectomy in early adulthood.** Peraino, C.; Stevens, F.J.; Staffeldt, E.F.; Russell, J.J.; Prapuolenis, A.; Blomquist, J.A.; Carnes, B.A.; Maronpot, R.R. Argonne National Lab., IL (USA). [1989]. 16p. Sponsored by U.S. DOE Energy Research; U.S. Department of Health and Human Services. DOE Contract W-31109-ENG-38. Y01-ES-20091. Order Number DE90003011. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The production and phenotypic properties of altered hepatocyte foci that appear prior to hepatic tumor formation were compared in rats initiated with a single low dose of diethylnitrosamine (DEN, 4 micrograms/g body weight), either neonatally or 24 h after partial hepatectomy at 57 days of age, and subsequently promoted with 0.05% dietary phenobarbital. All rats were killed at 100 days after initiation and their livers were examined for foci exhibiting between one and six histochemical markers as well as for cytomorphological changes detected by hematoxylin and eosin staining. Those foci that were detectable solely by histochemical means were designated hist(+)/morph(–) foci and those that also showed cytomorphological aberrations were classified as hist(+)/morph(+) foci. Frequencies, sizes, and histochemical phenotypes of foci in each of the two classes were determined by computer-assisted image analysis of stained serial sections from frozen livers. The results showed that the foci generated by the neonatal initiation protocol were substantially larger and more abundant than those produced by initiation after partial hepatectomy. Moreover, the focus populations generated by the two initiation systems differed in terms of their histochemical and cytomorphological properties, with the foci from the neonatal initiation protocol exhibiting greater evidence of deviation from normalcy (i.e., having higher proportions of foci with more histochemical markers and cytomorphological changes) than the foci from the partial hepatectomy protocol. 18 refs., 3 tabs.

3600 (BNL–43112) **Amperometric biosensors for glucose, lactate, and glycolate based on oxidases and redox-modified siloxane polymers.** Hale, P.D.; Inagaki, Toru; Lee, Hung Sui; Skotheim, T.A.; Karan, Hiroko I.; Okamoto, Yoshi. Brookhaven National Lab., Upton, NY (USA). [1989]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8909256–1: Symposium on biosensors, Chapel Hill, NC (USA), 7-9 Sep 1989). Order Number DE90002301. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Amperometric biosensors based on flavin-containing oxidases undergo several steps which produce a measurable current that is related to the concentration of substrate. In the initial step, the substrate converts the oxidized flavin adenine dinucleotide (FAD) or flavin mononucleotide (FMN) into the reduced form ($FADH_2$ or $FMNH_2$). Because these cofactors are located well within the enzyme molecule, direct electron transfer to the surface of a conventional electrode does not occur to a measurable degree. A common method of facilitating this electron transfer is to introduce oxygen into the system because it is the natural acceptor for the oxidases; the oxygen is reduced by the $FADH_2$ or $FMNH_2$ to hydrogen peroxide, which can then be detected electrochemically. The major drawback to this approach is the fact that oxidation of hydrogen peroxide requires a large overpotential, thus making these sensors susceptible to interference from electroactive species. To lower the necessary applied potential, several non-physiological redox couples have been employed to shuttle electrons between the flavin moieties and the electrode. For example, sensors based on the ferrocene/ferricinium redox couple and on electrodes consisting of conducting salts such as TTF-TCNQ (tetrathiafulvalene-tetracyanoquinodimethane) have previously been reported. Electron relays have also been attached directly to the enzyme molecule to facilitate electron transfer. More recently, these studies have been extended to include systems where the mediating redox species are covalently attached to polymers such as poly(pyrrole), poly(vinylpyridine), and poly(siloxane). The present paper describes the development of amperometric biosensors based on flavin-containing enzymes and this latter family of polymeric mediators. 9 refs., 5 figs.

3601 **Plant senescence: its biochemistry and physiology.** Thomson, W.W.; Nothnagel, E.A.; Huffaker, R.C. (eds.). 269p. American Society of Plant Physiologists, Rockville, MD (1987). Sponsored by U.S. DOE Energy Research. DOE Contract FG03-85ER13334. From 10. annual symposium in plant physiology: plant senescence: its biochemistry and physiology; Riverside, CA (USA); 6-10 Jan 1987.

Considering the early phylogenetic appearance of functional xylem and phloem elements and the range of senescent processes expressed onto genetically, it becomes apparent that such processes are inextricably linked to the evolution, development, reproduction, form, and function of higher plants. The importance of these senescent processes to man are patently obvious since, in one form or another, these processes provide major sources of wood, fiber, and fuel, and are involved in seed development and grain and fruit ripening. To many, the results of senescent processes also have esthetic value including, for example, the grandeur of a Sequoia, the blaze of colors across a desert landscape covered in the spring by ephermal flowers, or the rich tones and panoramic splendor of a deciduous forest in autumn. Senescent processes are widespread, but varied in kind and degree, ranging from whole plants to individual tissues and cells. This symposium was organized primarily around cellular and biochemical aspects of senescence. A major emphasis was the view that senescent processes, and those which developmentally lead to senescence, are highly regulated with an underlying genetic component. Individual papers were processed separately for the database.

3602 (DOE/ER/13581–3) **Gene-enzyme relationships in somatic cells and their organismal derivatives in higher plants: Progress report, August 1, 1988–July 31, 1989.** Jensen, R.A. Florida Univ., Gainesville, FL (USA). 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER13581. Order Number DE90002544. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A novel natural product structurally related to prephenate and arogenate was isolated from a mutant of Neurospora crassa. This D-β-(1-carboxy-4-hydroxy-2, 5-cyclohexadiene-1-yl)-lactic acid has been given the trivial name of D-prephenyllactate. The new metabolite is even more acid labile than is prephenate and is quantitatively converted to phenyllactate at mildly acidic pH. The structure characterization of prephenyllactate was performed using spectroscopic techniques (ultraviolet, ^1H NMR, ^{13}C NMR, two-dimensional heteronuclear experiments and mass spectrometry). Circular dichroism proved conclusively the R configuration of the asymmetric carbon at

C-8 of prephenyllactate. Enzymatic utilization of prephenyllactate by cyclohexadienyl dehydratase and by cyclohexadienyl dehydrogenase from Klebsiella pneumoniae was demonstrated. 6 refs.

3603 (DOE/ER/60692–2) **Mapping and ordered cloning of the human X chromosome: Progress report, November 1988–October 1989.** Caskey, C.T.; Nelson, D.L.; Ledbetter, D.H. Baylor Univ., Houston, TX (USA). Inst. of Molecular Genetics. Oct 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER60692. Order Number DE90002542. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Progress in this project has continued in several areas. These will each be discussed in detail. Overall, the progress has been excellent, with some of the major goals of the application achieved. The areas currently underway are: (1) The establishment of a large number of cloned DNA segments from the region of the X chromosome retained in the X3000-11.1 cell line, (2) The development and use of a sub-chromosomal localization panel of somatic cell hybrids for mapping cloned probes from the X, (3) The development of Alu PCR as a technique for isolating human-specific DNA from a variety of sources, and (4) The establishment of methods for identification and isolation of expressed sequences.

3604 (PB–89-231773/XAB) **Biotechnology research and development activities in industry: 1984 and 1985. Surveys of Science Resources series.** Chirichiello, J.R. National Science Foundation, Washington, DC (USA). Div. of Science Resources Studies. May 1987. 30p. (NSF–87-311). Available from NTIS, PC A03/MF A01.

The report provides estimates of industry's financing of biotechnology research and development (R&D) by sources of support, by technique, and by application. Also provided are data on the employment of scientists and engineers working on biotechnology R&D projects by field and by technique.

3605 **Control of ATP hydrolysis by ADP bound at the catalytic site of chloroplast ATP synthase as related to protonmotive force and Mg^{2+}.** Du, Z. (Univ. of California, Los Angeles (USA)); Boyer, P.D. *Biochemistry (USA),* 28(2): 873-879 (24 Jan 1989). DOE Contract FG03-88ER13845.

The activation of the ATP synthesis and hydrolysis capacity of isolated chloroplast membranes by protonmotive force is known to be associated with the release of tightly bound ADP from the ATP synthase. The data support the view that the activation requires only those structural changes occurring in the steady-state reaction mechanism. The trapping of ADP released during light activation or the chelation of Mg^{2+} with EDTA effectively reduces the rate of decay of the ATPase activity. When the release of tightly bound ADP and Mg^{2+} is promoted by light activation, followed by immediate dilution and washing to retard the rebinding of the ADP and Mg^{2+} released, the ATPase activity remains high in the dark long after the protonmotive force has disappeared. After the addition of ADP and Mg^{2+} the decay of the ATPase activity has the same characteristics as those of the unwashed chloroplast membrane. The results are interpreted as indicating that both Mg^{2+} and ADP must be present prior to exposure to MgATP for the ATPase to be inhibited. However, in contrast to the isolated chloroplast ATPase, the steady-state activity of the membrane-bound ATPase is not inhibited by excess Mg^{2+}. The replacement of [^{3}H]ADP from catalytic sites during hydrolysis of unlabeled ATP or during photophosphorylation with unlabeled ADP occurs as anticipated if Mg^{2+} and ADP bound at one catalytic site without P_i block catalysis by all three enzyme sites. The inhibited form induced by Mg^{2+} and ADP may occur only under laboratory conditions and not have an in vivo role.

3606 **Transcription of oxygen-regulated photosynthetic genes requires DNA gyrase in Rhodobacter capsulatus.** Zhu, Yu Sheng (Lawrence Berkeley Lab., CA (USA)); Hearst, J.E. *Proceedings of the National Academy of Sciences of the United States of America (USA),* 85(12): 4209-4213 (Jun 1988). DOE Contract AC03-76SF00098.

The regulation of the photosynthetic genes by DNA supercoiling in Rhodobacter capsulatus has been studied by using gyrase inhibitors in vivo and by measurement of mRNA levels of more than a dozen genes. The results demonstrate that the levels of mRNA for light-harvesting (I,II) and reaction center (L, M, H) proteins, bacteriochlorophyll biosynthetic enzymes, ribulose-bisphosphate carboxylase (EC 4.1.1.39), and the mRNAs from the open reading frames Q and R decreased immediately and dramatically upon addition of novobiocin and coumermycin. In contrast, the mRNAs for carotenoid biosynthetic enzymes, the cytochrome bc_1 complex, and constitutively expressed mRNA under aerobic conditions for light-harvesting I and for reaction center (L, M) proteins are less sensitive to the inhibitors. In accordance with these results, the biosynthesis of bacteriochlorophyll is markedly repressed by gyrase inhibitors novobiocin, coumermycin, nalidixic acid, and oxolinic acid either under anaerobic conditions or during a shift from aerobic to anaerobic conditions. The synthesis of light-harvesting (I, II) bacteriochlorophyll complexes is also inhibited by novobiocin and coumermycin. The kinetics of specific mRNA changes and the differential sensitivity of anaerobic and aerobic genes to the gyrase inhibitors strongly suggest that DNA supercoiling is involved in the differential expression of photosynthetic genes in response to the level of oxygen in R. capsulatus.

3607 **Sequence and nitrate regulation of the Arabidopsis thaliana mRNA encoding nitrate reductase, a metalloflavoprotein with three functional domains.** Crawford, N.M. (Stanford Univ. School of Medicine, CA (USA)); Smith, M.; Bellissimo, D.; Davis, R.W. *Proceedings of the National Academy of Sciences of the United States of America (USA),* 85(14): 5006-5010 (Jul 1988). DOE Contract FG03-84ER13265.

The sequence of nitrate reductase mRNA from the plant Arabidopsis thaliana has been determined. A 3.0-kilobase-long cDNA was isolated from a λgt10 cDNA library of Arabidopsis leaf poly(A)$^+$ RNA. The cDNA hybridized to a 3.2-kilobase mRNA whose level increased 15-fold in response to treatment of the plant with nitrate. An open reading frame encoding a 917 amino acid protein was found in the sequence. This protein is very similar to tobacco nitrate reductase, being >80% identical within a section of 450 amino acids. By comparing the Arabidopsis protein sequence with other protein sequences, three functional domains were deduced: (i) a molybdenum-pterin-binding domain that is similar to the molybdenum-pterin-binding domain of rat liver sulfite oxidase, (ii) a heme-binding domain that is similar to proteins in the cytochrome b_5 superfamily, and (iii) an FAD-binding domain that is similar to NADH-cytochrome b_5 reductase.

3608 (ANL/PPRNT–89-191) **Induction of sister chromatid exchanges by direct and indirect chemical agents in a human teratoma cell line.** Murison, G. Argonne National Lab., IL (USA). [1989]. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90003004. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In the present work, we have extended the characterization of the P3 cell line, derived from a human epithelial teratocarcinoma, by studying the induction of sister chromatid exchanges (SCEs) by direct and indirect carcinogens. Several direct-acting carcinogens produce a dose-dependent increase in SCEs. Most notably, N-methyl-N′-nitro-N-nitrosoguanidine and 7β, 8α-dihydroxy-9 α,10α-epoxy-7,8,9,10-tetrahydrobenzo(a)pyrene produce increases in SCEs at dosages comparable to those used to induce mutations at the hypoxanthine-guanine phosphoribosyl transferase locus. The indirect carcinogens elicit SCEs only when the P3 cells are cocultured with cells capable of metabolizing the indirect carcinogens to the active form. Human breast carcinoma (BJ-015) and rat hepatoma (RL12) cells are equally efficient in activating polycyclic aromatic hydrocarbons to the active form. This cell-mediated induction of SCEs is obtained when P3 cells are incubated with live, x-irradiated, or UV-irradiated BJ or RL cells. This P3 cell line is thus equally suitable to study the induction of mutations or the induction of SCEs with direct and indirect carcinogens. 35 refs., 3 tabs.

3609 (EGG-M–88477) **Comparison of digestion procedures used for the determination of boron in biological tissues by ICP-AES [inductively-coupled, plasma-atomic emission spectroscopy].** Bauer, W.F.; Miller, D.L.; Steele, S.M. EG and G Idaho, Inc., Idaho Falls, ID (USA). [1988]. 4p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8812115–1:
